Combinación compleja de hidrocarburos obtenida como el extracto de un proceso de extracción con disolvente. Compuesta fundamentalmente de hidrocarburos aromáticos con un número de carbonos en su mayor parte dentro del intervalo de C_7 a C_{12} , y en un intervalo de ebullición de 90 °C a 220 °C]

· ekstrakter (råolie), tung naphtha solvent-; Uspecificeret petroleum

En sammensat blanding af carbonhydrier opnået som ekstraktet fra en solventekstraktionsproces. Den består overvejende af aromatiske carbonhydrier, overvejende C_7 , til og med C_{12} , med koginterval omtrent fra 90 °C til 220 °C]

· Extrakte (Erdöl), schwere Naphtha-Lösungsmittel-; Kerosin — nicht spezifiziert

Complexe Kombination von Kohlenwasserstoffen, erhalten als Extrakt aus einem Lösungsmittelextraktionsverfahren. Besteht vorherrschend aus aromatischen Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_7 bis C_{12} und siedet im Bereich von etwa 90 °C bis 220 °C]

· εκχυλίσματα (πετρελαίου), βαριάς νάφθας εξευγενισμένης με διαλύτη· Κεροξίνη — μη προδιαγεγραμμένη

Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται σαν το εκχύλισμα από εκχύλιση με διαλύτη. Συνίσταται κυρίως από αρωματικούς υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_7 , ως και C_{12} , και με περιοχή βρασμού από 90 °C ως 220 °C περίπου]

· Extracts (petroleum), heavy naphtha solvent; Kerosine — unspecified

A complex combination of hydrocarbons obtained as the extract from a solvent extraction process. It consists predominantly of aromatic hydrocarbons having carbon numbers predominantly in the range of C_7 through C_{12} and boiling in the range of approximately 90 °C to 220 °C (194 °F to 428 °F)]

· extraits au solvant (pétrole), naphtha lourd; Kérosène — non spécifié

Combinaison complexe d'hydrocarbures obtenue comme extrait lors d'une extraction au solvant. Se compose principalement d'hydrocarbures aromatiques dont le nombre de carbones se situe en majorité dans la gamme C_7 - C_{12} et dont le point d'ébullition est compris approximativement entre 90 °C et 220 °C]

· estratti (petrolio), nafta solvente pesante; Cherosene — non specificato

Combinazione complessa di idrocarburi ottenuta come raffinata da un processo di estrazione con solvente. È costituita prevalentemente da idrocarburi saturi con numero di atomi di carbonio prevalentemente nell'intervallo C_7 - C_{12} , e punto di ebollizione nell'intervallo 90 °C-220 °C ca]

· extracten (aardolie), zware nafta-solvent; Kerosine — niet gespecificeerd

Een complexe verzameling koolwaterstoffen, verkregen als het extract van een solvent-extractieproces. Bestaat voornamelijk uit aromatische koolwaterstoffen, overwegend C_7 , tot en met C_{12} , met een kooktraject van ongeveer 90 °C tot 220 °C]

· extratos (petróleo), de solvente de nafta pesada; Queroseno — não especificado

Uma combinação complexa de hidrocarbonetos obtida como o extracto de um processo de extração com solvente. É constituída predominantemente por hidrocarbonetos aromáticos com números de átomos de carbono predominantemente na gama de C_7 , até C_{12} , e destila no intervalo de aproximadamente 90 °C a 220 °C]

destilados (petróleo), fracción ligera neutralizada químicamente ; Queroseno, sin especificar

[Combinación compleja de hidrocarburos producida por un proceso de tratamiento para separar materiales ácidos. Compuesta de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_8 a C_{16} y con un intervalo de ebullición aproximado de 150 °C a 290 °C]

destillater (råolie), kemisk neutraliserede lette ; Uspecificeret petroleum

[En sammensat blanding af carbonhydrider fremstillet ved en behandlingsproces til fjernelse af sure materialer. Den består af carbonhydrider, overvejende C_8 til og med C_{16} , med koginterval omtrent fra 150 °C til 290 °C]

Destillate (Erdöl), chemisch neutralisierte leichte ; Kerosin — nicht spezifiziert

[Komplexe Kombination von Kohlenwasserstoffen, erhalten durch eine Behandlungsmethode zum Entfernen saurer Stoffe. Besteht aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_8 bis C_{16} und siedet im Bereich von etwa 150 °C bis 290 °C]

αποσταγμάτα (πετρέλαιου), ελαφρά χημικώς εξουδετερωμένα· Κεροζίνη — μη προδιαγεγραμμένη

[Πολύπλοκος συνδυασμός υδρογονανθράκων που παραγεται με κατεργασία για να απομακρυνθούν όξινα συστατικά. Συνίσταται από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_8 ως και C_{16} και με περιοχή βρασμού από 150 °C ως 290 °C περίπου]

Distillates (petroleum), chemically neutralized light ; Kerosine — unspecified

[A complex combination of hydrocarbons produced by a treating process to remove acidic materials. It consists of hydrocarbons having carbon numbers predominantly in the range of C_8 through C_{16} and boiling in the range of approximately 150 °C to 290 °C (302 °F to 554 °F)]

distillats légers (pétrole), neutralisés chimiquement ; Kérosène — non spécifié

[Combinaison complexe d'hydrocarbures résultant d'un traitement consistant à éliminer les matières acides. Se compose d'hydrocarbures dont le nombre de carbones se situe principalement dans la gamme C_8 - C_{16} et dont le point d'ébullition est compris approximativement entre 150 °C a 290 °C]

distillati (petrolio), frazione leggera neutralizzata chimicamente ; Cherosene — non specificato

[Combinazione complessa di idrocarburi prodotta con un processo di trattamento per la rimozione delle sostanze acide. E costituita da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_8 - C_{16} e intervallo di ebollizione 150 °C-290 °C ca.]

destillaten (aardolie), chemisch geneutraliseerd lichte fractie ; Kerosine — niet gespecificeerd

[Een complexe verzameling koolwaterstoffen, verkregen uit een behandlingsproces om zure materialen te verwijderen. Bestaat uit koolwaterstoffen, overwegend C_8 tot en met C_{16} , met een kooktraject van ongeveer 150 °C tot 290 °C]

destilados (petróleo), leves neutralizados químicamente ; Queroseno — não especificado

[Uma combinação complexa de hidrocarbonetos produzida por um processo de tratamento para remoção de materiais ácidos. E constituída por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_8 até C_{16} e destila no intervalo de aproximadamente 150 °C a 290 °C]

Destilados (petroleo), fraccion ligera tratada con hidrogeno, Queroseno, sin especificar
 Combinacion compleja de hidrocarburos obtenida por tratamiento de una fraccion de petroleo con hidrogeno en presencia de un catalizador. Compuesta de hidrocarburos con un numero de carbonos en su mayor parte dentro del intervalo C_8 a C_{16} y con un intervalo de ebullicion aproximado de 150 °C a 290 °C }

- Destillater (raolie), hydrogenbehandlede lette, Uspecificeret petroleum
 En sammensat blanding af carbonhydrider opnået ved at behandle en raoliefraction med hydrogen i tilstedeværelse af en katalysator. Den består af carbonhydrider, overvejende C_8 til og med C_{16} , med koginterval omtrent fra 150 °C til 290 °C }
- Destillate (Erdöl), mit Wasserstoff behandelte leichte Kerosin — nicht spezifiziert
 Komplexe Kombination von Kohlenwasserstoffen, erhalten durch Behandeln einer Erdölfraction mit Wasserstoff in Gegenwart eines Katalysators. Besteht aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_8 bis C_{16} und siedet im Bereich von etwa 150 °C bis 290 °C }

εστίλατα (πετρελαιο), ελαφρά κατεργασμένα με υδρογόνο Κεροζίνη — μη προδιαγεγραμμένη
 Πολυπλοκή συνδυασμός υδρογονανθράκων που λαμβάνεται με κατεργασία κλάσματος πετρελαιο με υδρογόνο παρουσία κατάλληλου καταλύτη. Συνίσταται από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_8 ως και C_{16} και με περιοχή έβρασμού από 150 °C ως 290 °C περίπου }

Distillates (petroleum), hydrotreated light, Kerosine — unspecified
 A complex combination of hydrocarbons obtained by treating a petroleum fraction with hydrogen in the presence of a catalyst. It consists of hydrocarbons having carbon numbers predominantly in the range of C_8 through C_{16} and boiling in the range of approximately 150 °C to 290 °C (302 °F to 554 °F) }

- Distillats legers (petrole), hydrotraités, Kerosene — non spécifique
 Combinaison complexe d'hydrocarbures obtenue par traitement d'une fraction petroliere a l'hydrogene en preence d'un catalyseur. Se compose d'hydrocarbures dont le nombre de carbones se situe principalement dans la gamme C_8 - C_{16} et dont le point d'ebullition est compris approximativement entre 150 °C et 290 °C }
- Distillati (petrolio), frazione leggera di "hydrotreating", Cherosene — non specificato
 Combinazione complessa di idrocarburi ottenuta per trattamento di una frazione di petrolio con idrogeno in presenza di un catalizzatore. E costituita da idrocarburi con numero di carbonio prevalentemente nell'intervallo C_8 - C_{16} e punto di ebollizione nell'intervallo 150 °C - 290 °C ca }
- Destillaten (aardolie), met waterstof behandelde lichte fractie, Kerosine — niet gespecificeerd
 Een complexe verzameling koolwaterstoffen, verkregen door behandeling van een aardoliefractie met waterstof in de aanwezigheid van een katalysator. Bestaat uit koolwaterstoffen, overwegend C_8 tot en met C_{16} , met een kooktraject van ongeveer 150 °C tot 290 °C }
- Destilados (petroleo), leves tratados com hidrogenio, Queroseno — não especificado
 Uma combinação complexa de hidrocarbonetos obtida por tratamento de uma fração petrolífera com hidrogenio na presença de um catalisador. E constituída por hidrocarbonetos com numeros de atomos de carbono predominantemente na gama de C_8 ate C_{16} e destila no intervalo de aproximadamente 150 °C a 290 °C }

querosina (petróleo), hidrodesulfurada, Queroseno, sin especificar

Combinación compleja de hidrocarburos obtenida de una reserva de petróleo por tratamiento con hidrógeno para transformar el azufre orgánico en sulfuro de hidrógeno, que se separa. Compuesta de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_4 a C_{16} , y con un intervalo de ebullición aproximado de 150 °C a 290 °C]

- petroleum (råolie), hydroafsvovlet; Uspecificeret petroleum
En sammensat blanding af carbonhydnder opnået fra en rå olie ved behandling med hydrogen for at omdanne organisk svovl til hydrogensulfid, der fjernes. Den består af carbonhydnder, overvejende C_4 til og med C_{16} , med kogesinterval omtrent fra 150 °C til 290 °C]
- Kerosin (Erdöl), hydrodesulfuriertes, Kerosin — nicht spezifiziert
Komplexe Kombination von Kohlenwasserstoffen, erhalten aus einem Erdölgrundstoff durch Behandeln mit Wasserstoff, um organischen Schwefel in Schwefelwasserstoff zu verwandeln, der entfernt wird. Besteht aus Kohlenwasserstoffen mit Kohlenstoffanteilen vorherrschend im Bereich von C_4 bis C_{16} und siedet im Bereich von etwa 150 °C bis 290 °C]
- κηροζίνη (πετρελαίου), υδρογονοαποθειωμένη· Κηροζίνη — μη προδιαγεγραμμένη
Πολύπλοκος συνδυασμός υδρογονάνθρακων που λαμβάνεται από πρώτη ύλη πετρελαίου με κατεργασία με υδρογόνο για την μετατροπή του οργανικού θείου σε υδρόθειο, το οποίο απομακρύνεται. Συνίσταται κυρίως από υδρογονάνθρακες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_4 έως και C_{16} και βράζει στην περιοχή από 150 °C έως 290 °C περίπου]

Kerosine (petroleum), hydrodesulfurized, Kerosine — unspecified

A complex combination of hydrocarbons obtained from a petroleum stock by treating with hydrogen to convert organic sulfur to hydrogen sulfide which is removed. It consists of hydrocarbons having carbon numbers predominantly in the range of C_4 through C_{16} and boiling in the range of approximately 150 °C to 290 °C (302 °F to 554 °F)]

- kerosene (pétrole), hydrodésulfuré; Kérosène — non spécifié
Combinaison complexe d'hydrocarbures obtenue par traitement à l'hydrogène d'une charge pétrolière afin de convertir le soufre organique en hydrogène sulfuré qui est ensuite éliminé. Se compose d'hydrocarbures dont le nombre de carbones se situe en majeure partie dans la gamme C_4 - C_{16} et dont le point d'ébullition est compris approximativement entre 150 °C et 290 °C]
- cherosene (petrolio), idrodesolforato; Cherosene — non specificato
Combinazione complessa di idrocarburi ottenuta da uno stock di petrolio trattandolo con idrogeno per trasformare lo zolfo organico in idrogeno solforato che viene eliminato. È costituita da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_4 - C_{16} e punto di ebollizione nell'intervallo 150 °C - 290 °C ca]
- kerosine (aardolie), met waterstof ontzwaveld; Kerosine — niet gespecificeerd
Een complexe verzameling koolwaterstoffen, verkregen uit een aardoliegrondstof door behandeling met waterstof om organische zwavel om te zetten in waterstofsulfide dat wordt verwijderd. Bestaat uit koolwaterstoffen, overwegend C_4 tot en met C_{16} , met een kooktraject van ongeveer 150 °C tot 290 °C]
- querosene (petróleo), hidrogenodessulfurizado, Queroseno — não especificado
Uma combinação complexa de hidrocarbonetos obtida por tratamento de uma fração petrolífera com hidrogénio para converter o zolfo orgânico em sulfureto de hidrogénio que é removido. É constituída por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_4 até C_{16} e destila no intervalo de aproximadamente 150 °C a 290 °C]

Νάφθα (petroleo), fraccion pesada hidrodesulfurada reformada cataliticamente, fraccion aromatica, Queroseno, sin especificar

Combinacion compleja de hidrocarburos producida por el fraccionamiento de nafta hidrodesulfurada reformada cataliticamente. Compuesta fundamentalmente de hidrocarburos aromaticos con un numero de carbonos en su mayor parte dentro del intervalo de C_{10} a C_{14} , con un intervalo de ebullicion aproximado de 98 °C a 218 °C]

Νάφθα (råolie), katalytisk reformeret hydroafsvovlet tung, aromatfraktion, Uspecificeret

En sammensat blanding af carbonhydrider fremstillet ved fraktionering af katalytisk reformeret, hydroafsvovlet naphtha. Den består overvejende af aromatiske carbonhydrider, overvejende C_{10} til C_{14} , med kogesinterval omtrent fra 98 °C til 218 °C]

Νάφθα (Erdöl), katalytisch reformierte hydrodesulfurierte schwere, aromatische Fraktion, Kerosin — nicht spezifiziert

Ein komplexe Kombination von Kohlenwasserstoffen erhalten durch Fraktionierung aus katalytisch reformierter hydrodesulfurierter Naphtha. Besteht vorherrschend aus aromatischen Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{10} bis C_{14} und siedet im Bereich von etwa 98 °C bis 218 °C]

Νάφθα (πετρελαιο), καταλυτικά αναμορφωμένης, υδρογονοαποθειωμένης βαριάς, αρωματικό κλάσμα Κηρυζίνη — μη προδιαγεγραμμένη

Μεταλλικός συνδυασμός υδρογονάνθρακων που παραγεται με κλασματωση απο υδρογονοαποθειωμένη ναφθα που έχει υποστεί καταλυτική πυρόλυση. Συνιστάται κυρίως από αρωματικούς υδρογονάνθρακες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{10} έως C_{14} , και βράζει στην περιοχή απο 98 °C έως 218 °C περίπου]

Νάφθα (petroleum), catalytic reformed hydrodesulfurized heavy, arom. fraction, Kerosine — unspecified

A complex combination of hydrocarbons produced by fractionation from catalytically reformed hydrodesulfurized naphtha. It consists predominantly of aromatic hydrocarbons having carbon numbers predominantly in the range of C_{10} to C_{14} , and boiling in the range of approximately 98 °C to 218 °C (208 °F to 424 °F)]

Νάφθα lourde hydrodésulfurée (pétrole), reformage catalytique, fraction aromatique, Kérosène — non spécifique

Combinaison complexe d'hydrocarbures obtenue par fractionnement a partir de naphtha hydrodésulfure de reformage catalytique. Elle compose principalement d'hydrocarbures aromatiques dont le nombre de carbones se situe en majorite dans la gamme C_{10} - C_{14} , dont le point d'ebullition est compris approximativement entre 98 °C et 218 °C]

Νάφθα (petrolio), pesante idrodesolforata da reforming catalitico, frazione aromatica, Cherosene — non specificato

Combinazione complessa di idrocarburi ottenuta per frazionamento di nafta da reformer catalitico idrodesolforata. È costituita prevalentemente da idrocarburi aromatici con numero di atomi di carbonio prevalentemente nell'intervallo C_{10} - C_{14} , e punto di ebollizione nell'intervallo 98 °C-218 °C ca]

Νάφθα (aardolie), katalytisch gereformeerd met waterstof ontwazelde zware fracties, aromatische fractie, Kerosine — niet gespecificeerd

Een complexe verzameling koolwaterstoffen verkregen door fractionering van katalytisch gereformeerde met waterstof ontwazelde nafta. Het bestaat voornamelijk uit aromatische koolwaterstoffen, overwegend C_{10} tot C_{14} , met een kooktraject van ongeveer 98 °C tot 218 °C]

Νάφθα (petroleo), pesada hidrogenodessulfurizada do reforming catalitico, fraccão aromática, Queroseno — não especificado

Uma combinação complexa de hidrocarbonetos produzida por fracionamento da nafta hidrogenodessulfurizada do reforming catalítico. É constituída predominantemente por hidrocarbonetos aromaticos com numeros de átomos de carbono predominantemente na gama de C_{10} ate C_{14} , e destila no intervalo de aproximadamente 98 °C a 218 °C]

NOTA H

querosina (petroleo), desazufrada, Queroseno, sin especificar

Combinacion compleja de hidrocarburos obtenida sometiendo un destilado del petroleo a un proceso de desazufrado para transformar mercaptanos o separar impurezas acidas. Compuesta fundamentalmente de hidrocarburos con un numero de carbonos en su mayor parte dentro del intervalo de C_4 a C_{16} , y con un intervalo de ebullición de 130 °C a 290 °C.]

petroleum (råolie), sweetenet; Uspecificeret petroleum

En sammensat blanding af carbonhydinder opnået ved at underkaste en råoliedestillat en sweetening-proces for at omdanne mercaptaner eller fjerne sure urenheder. Den består overvejende af carbonhydrider, overvejende C_4 til og med C_{16} , med kogeinterval omtrent fra 130 °C til 290 °C.]

= Kerosin (Erdöl), gesußt, Kerosin — nicht spezifiziert

Komplexe Kombination von Kohlenwasserstoffen, die man aus einem Erdöl-Destillat durch Einwirkung eines Süßungsverfahrens zur Konvertierung von Mercaptanen oder zum Entfernen saurer Verunreinigungen erhält. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_4 bis C_{16} und siedet im Bereich von etwa 130 °C bis 290 °C.]

κηροζίνη (πετρελαίου), γλυκασμένη· Κηροζίνη — μη προδιαγεγραμμένη

Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται όταν απόσταγμα πετρελαίου υποβληθεί σε κατεργασία γλυκανσης για τη μετατροπή των μερκαπτανών ή την απομακρυνση των οξίων προσμιξεων. Αποτελείται κυρίως από υδρογονανθρακες με αριθμο ατομων ανθρακα κατά κυριο λόγο στην περιοχή από C_4 έως και C_{16} και βράζει στην περιοχή από 130 °C έως 290 °C.]

Kerosine (petroleum), sweetened, Kerosine — unspecified

A complex combination of hydrocarbons obtained by subjecting a petroleum distillate to a sweetening process to convert mercaptans or to remove acidic impurities. It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_4 through C_{16} and boiling in the range of 130 °C to 290 °C (266 °F to 554 °F).]

= kerosene adouci (petrole), Kérosène — non spécifique

Combinaison complexe d'hydrocarbures obtenue par adoucissement d'un distillat de petrole, afin de convertir les mercaptans ou d'eliminer les impuretes acides. Se compose en majorite d'hydrocarbures dont le nombre de carbones se situe principalement dans la gamme C_4 - C_{16} , et dont le point d'ébullition est compris entre 130 °C et 290 °C.]

= cherosene (petrolio), addolcito, Cherosene — non specificato

Combinazione complessa di idrocarburi ottenuta sottoponendo un distillato di petrolio ad un procedimento di addolcimento per convertire i mercaptani o per eliminare impurezze acide. E costituita prevalentemente da idrocarburi con un numero di atomi di carbonio prevalentemente nell'intervallo C_4 - C_{16} e con punto di ebollizione nell'intervallo 130 °C-290 °C.]

kerosine (aardolie), stankvrij gemaakt, Kerosine — niet gespecificeerd

Een complexe verzameling koolwaterstoffen die wordt verkregen door het onderwerpen van een aardoliedestillaat aan een stankverwijderend proces om mercaptanen om te zetten of zure onzuiverheden te verwijderen. Bestaat voornamelijk uit koolwaterstoffen, overwegend C_4 tot en met C_{16} , met een kooktraject van 130 °C tot 290 °C.]

Querosene (petroleo), tratado (sweetened), Queroseno — não especificado

Uma combinação complexa de hidrocarbonetos obtida sujeitando uma fracção petrolífera a um processo de sweetening para converter mercaptans ou remover impurezas acidas. É constituída predominantemente por hidrocarbonetos com numeros de átomos de carbono predominantemente na gama de C_4 ate C_{16} e destila no intervalo de aproximadamente 130 °C a 290 °C.]

NOTA H

- ES queroseno (petroleo), tratado con hidrogeno Queroseno, sin especificar
[Combinacion compleja de hidrocarburos obtenida por la destilacion de petroleo y posterior tratamiento con hidrógeno. Compuesta fundamentalmente de alcanos, cicloalcanos y alquilbencenos con un numero de carbonos en su mayor parte dentro del intervalo de C_{12} a C_{16} y con un intervalo de ebullicion aproximado de 230 °C a 270 °C.]
- DA petroleum (råolie), hydrogenbehandlet Uspecificeret petroleum
[En sammensat blanding af carbonhydrier opnået ved destillationen af råolie og efterfølgende hydrogenbehandling. Den består overvejende af alkaner, cycloalkaner og alkyibenzener, overvejende C_{12} til og med C_{16} , med kogeinterval omtrent fra 230 °C til 270 °C.]
- DE Kerosin (Erdöl), mit Wasserstoff behandelt, Kerosin — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen, die man durch Destillation von Erdöl und nachfolgender Behandlung mit Wasserstoff erhält. Besteht vorherrschend aus Alkanen, Cycloalkanen und Alkylbenzolen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{12} bis C_{16} und siedet im Bereich von etwa 230 °C bis 270 °C.]
- EL κηροζίνη (πετρελαίου), κατεργασμένη με υδρογόνο Κηροζίνη — μη προδιαγεγραμμένη
[Πολύπλοκος συνδυασμός υδρογονανθράκων που λαμβάνεται από την απόσταξη πετρελαίου και στη συνέχεια από κατεργασία με υδρογόνο που ακολουθεί. Συνίσταται κυρίως από αλκάνια, κυκλοαλκάνια και αλκυλοβενζόλια με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{12} έως και C_{16} και με περιοχή θρασμού από 230 °C έως 270 °C περίπου.]
- EN Kerosine (petroleum), hydrotreated Kerosine — unspecified
[A complex combination of hydrocarbons obtained from the distillation of petroleum and subsequent hydrotreatment. It consists predominantly of alkanes, cycloalkanes and alkylbenzenes having carbon numbers predominantly in the range of C_{12} through C_{16} and boiling in the range of approximately 230 °C to 270 °C (446 °F to 518 °F).]
- FR kérosène (pétrole), hydrotraité Kérosène — non spécifique
[Combinaison complexe d'hydrocarbures obtenue par distillation du pétrole puis hydrotraitement. Se compose principalement d'alcane, de cycloalcanes et d'alkylbenzenes dont le nombre de carbones se situe en majorité dans la gamme C_{12} - C_{16} et dont le point d'ébullition est compris approximativement entre 230 °C et 270 °C.]
- IT cherosene (petrolio), idrotrattato Cherosene — non specificato
[Combinazione complessa di idrocarburi ottenuta dalla distillazione di petrolio e successivo idrotrattamento. È costituita prevalentemente da alcani, cicloalcani e alchilbenzeni con numero di atomi di carbonio prevalentemente nell'intervallo C_{12} , C_{16} e punto di ebollizione nell'intervallo 230 °C-270 °C ca.]
- NL kerosine (aardolie), met waterstof behandeld Kerosine — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen door de destillatie van aardolie gevolgd door een behandeling met waterstof. Bestaat voornamelijk uit alkanen, cycloalkanen en alkyilbenzenen, overwegend C_{12} tot en met C_{16} , met een kooktraject van ongeveer 230 °C tot 270 °C.]
- PT querosene (petroleo), tratado com hidrogenio, Queroseno — não especificado
[Uma combinação complexa de hidrocarbonetos obtida da destilação de petróleo e tratamento subsequente com hidrogenio. É constituída predominantemente por alcanos, cicloalcanos e alquilbencenos com numeros de átomos de carbono predominante-mente na gama de C_{12} até C_{16} e destila no intervalo de aproximadamente 230 °C a 270 °C.]

[Een complexe verzameling koolwaterstoffen, verkregen door behandeling van lichte katalytisch gekraakte destillaten met waterstof, om organisch zwavel om te zetten in waterstofsulfide, dat wordt verwijderd. Bestaat uit koolwaterstoffen, overwegend C_4 tot en met C_{11} , met een kooktraject van ongeveer 150 °C tot 400 °C. Bevat een relatief grote hoeveelheid bicyclische aromatische koolwaterstoffen.]
- PT destilados (petroleo), leves do cracking catalítico hidrogenodesulfurizados. Gasóleo de cracking.
[Uma combinação complexa de hidrocarbonetos obtida por tratamento de destilados leves do cracking catalítico com hidrogenio para converter enxofre organico em sulfureto de hidrogenio que e removido. E constituida por hidrocarbonetos com numeros de atomos de carbono predominantemente na gama de C_4 ate C_{11} , e destila no intervalo de aproximadamente 150 °C ate 400 °C. Contem uma proporção relativamente elevada de hidrocarbonetos aromaticos biciclicos.]

NOTA H

- ES** residuos (petroleo), destilacion de nafta craqueada a vapor Gasóleo craqueado
[Combinacion compleja de hidrocarburos obtenida como un residuo del fondo de la columna de la separacion de efluentes del craqueo a vapor de nafta a elevada temperatura. Con un intervalo de ebullicion aproximado de 147 °C a 300 °C, y produce un aceite final con una viscosidad de 18cSt a 50 °C]
- DA** rester (råolie), dampkrakkede naphthadestillations- krakket gasolie
[En sammensat blanding af carbonhydrier opnaet som en kolonnebundfraktion fra separationen af udløb fra dampkrakning af naphtha ved høj temperatur. Den har kogesinterval omtrent fra 147°C til 300°C, og danner en færdig olie med en viskositet på 18cSt ved 50 °C]
- DE** Rückstände (Erdöl), dampfgekrackte Naphthadestillation Krackgasöl
[Komplexe Kombination von Kohlenwasserstoffen, die man als Kolonnenbodenlauf aus der Abtrennung von Ausflüssen aus dampfgekrackter Naphtha bei einer hohen Temperatur erhält. Siedet im Bereich von etwa 147 °C bis 300 °C und ergibt ein Fertigöl mit einer Viskosität von 18 cSt bei 50 °C]
- EL** υπολείμματα (πετρελαίου), απόσταξης ατμοπυρολυμένης ναφθας. Πετρέλαιο από διάσπαση
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται ως προϊόν πυθμένα στηλης από τον διαχωρισμό των εκροών από ατμοπύρωση ναφθας σε υψηλή θερμοκρασία. Βράζει στην περιοχή από 147° C έως 300° C περίπου και παράγει τελικό έλαιο με ιξώδες 18cSt σε 50 °C]
- EN** Residues (petroleum), steam-cracked naphtha distn., Cracked gasoil
[A complex combination of hydrocarbons obtained as a column bottom from the separation of effluents from steam cracking naphtha at a high temperature. It boils in the range of approximately 147 °C to 300 °C (297 °F to 572 °F) and produces a finished oil having a viscosity of 18cSt at 50 °C]
- FR** résidu de distillation (pétrole), vapocraquage de naphtha Gazole de craquage
[Combinaison complexe d'hydrocarbures obtenue en fond de colonne lors de la separation des effluents de vapocraquage du naphtha à haute température. Son point d'ébullition est compris approximativement entre 147 °C et 300 °C, et elle donne une huile-produit fini de viscosité égale à 18 cSt à 50 °C]
- IT** residui (petrolio), distillazione di nafta da cracking con vapore Gasolio da cracking
[Combinazione complessa di idrocarburi ottenuta come fondo di colonna della separazione di effluenti da nafta da cracking con vapore ad alta temperatura. Bolle nell'intervallo 147°C - 300°C ca. e produce un olio finito con viscosità di 18cSt a 50 °C]
- NL** residuen (aardolie), stoomgekraakte naftadestillatie Gekraakte gasolie
[Een complexe verzameling koolwaterstoffen die wordt verkregen als een kolombodemfractie uit de scheiding van uitstromen uit het stoomkraken van nafta bij hoge temperatuur. Heeft een kooktraject van ongeveer 147 °C tot 300 °C en vormt een voltooide olie met een viscositeit van 18 cSt bij 50 °C]
- PT** resíduos (petróleo), de destilação da nafta do steam-cracking, Gasóleo de «cracking»
[Uma combinação complexa de hidrocarbonetos obtida como um produto de cauda da separação de efluentes do steam-cracking da nafta a temperatura elevada. Destila no intervalo de aproximadamente 147 °C a 300 °C]

NOTA H

- ES destilados (petroleo), fraccion ligera craqueada cataliticamente, degradada termicamente Gasoleo craqueado
[Combinacion compleja de hidrocarburos producida por la destilacion de productos de un proceso de craqueo catalitico que se han utilizado como fluido de transferencia de calor Compuesta en su mayor parte de hidrocarburos con un intervalo de ebullicion aproximado de 190 °C a 340 °C Esta corriente es probable que contenga compuestos organicos de azufre]
- DA destillater (råolie), lette katalytisk krakkede, termisk nedbrudte Krakket gasolie
[En sammensat blanding af carbonhydrier fremstillet ved destillation af produkterne fra en katalytisk krakningsproces, der har været brugt som en varmeoverførselsvæske Den består overvejende af carbonhydrier med kogepunkt omtrent fra 190 °C til 340 °C Denne strøm indeholder sandsynligvis organiske svovforbindelser]
- DE Destillate (Erdöl), leichte katalytisch gekrackte, thermisch abgebaut Krackgsöl
[Komplexe Kombination von Kohlenwasserstoffen, hergestellt durch Destillation von Produkten aus einem katalytischen Crackverfahren, das als Wärmetransfer-Flüssigkeit benutzt wurde Besteht vorherrschend aus Kohlenwasserstoffen und siedet im Bereich von etwa 190 °C bis 340 °C Dieser Laut enthält wahrscheinlich organische Schwefelverbindungen]
- EL αποσταγματα (πετρελαίου), ελαφρά καταλυτικά, θερμικώς υποβαθμισμένα Πετρέλαιο από διάσπαση
[Πολυπλοκός συνδυασμός υδρογονανθράκων που παράγεται με την απόσπαση προϊόντων καταλυτικής πυρόλυσης και οποία έχουν χρησιμοποιηθεί σαν ρευστό μέσο μεταφοράς θερμότητας. Συνίσταται κυρίως από υδρογονάνθρακες με περιοχή βρασμού από 190 °C έως 340 °C περίπου Το ρευστό αυτό είναι πιθανό να περιέχει οργανικές ενώσεις θείου]
- EN Distillates (petroleum), light catalytic cracked, thermally degraded Cracked gasoil
[A complex combination of hydrocarbons produced by the distillation of products from a catalytic cracking process which has been used as a heat transfer fluid It consists predominantly of hydrocarbons boiling in the range of approximately 190 °C to 340 °C (374 °F to 644 °F) This stream is likely to contain organic sulfur compounds.]
- FR distillats légers (petrole), craquage catalytique, dégradation thermique, Gazole de craquage
[Combinaison complexe d'hydrocarbures obtenue par distillation des produits résultant d'un craquage catalytique, et qui a été utilisée comme fluide caloporteur Se compose principalement d'hydrocarbures dont le point d'ébullition est compris approximativement entre 190 °C et 340 °C Peut contenir des composés organiques soufrés.]
- IT distillati (petrolio), leggeri da cracking catalitico, degradati termicamente Gasolio da cracking
[Combinazione complessa di idrocarburi prodotta dalla distillazione di prodotti da un processo di cracking catalitico che è stato usato come fluido di scambio di calore È costituita prevalentemente da idrocarburi con punto di ebollizione nell'intervallo 190 °C-340 °C ca Questa corrente può contenere probabilmente composti organici dello zolfo]
- NL destillaten (aardolie), katalytisch gekraakte lichte fracties, thermisch gedesintegreerd Gekraakte gasolie
[Een complexe verzameling koolwaterstoffen die wordt gevormd door de destillatie van producten uit een katalytisch kraakproces en die is gebruikt als een warmte-overdrachtsvloeistof Bestaat voornamelijk uit koolwaterstoffen met een kooktraject van ongeveer 190 °C tot 340 °C Deze stroom bevat waarschijnlijk organische zwavelverbindingen]
- PT: destilados (petroleo), leves do cracking catalítico, degradados termicamente Gasoleo de cracking
[Uma combinação complexa de hidrocarbonetos produzida pela destilação de produtos de um processo de cracking catalítico que foi usada como fluido térmico É constituída predominantemente por hidrocarbonetos que destilam no intervalo de aproximadamente 190 °C a 340 °C Esta fracção geralmente contém compostos organicos de enxofre]

NOTA H

- ES residuos (petróleo), nafta saturada con calor craqueada a vapor , Gasóleo craquedo
[Combinación compleja de hidrocarburos obtenida como residuo de la destilación de nafta saturada con calor craqueada a vapor y con un intervalo de ebullición aproximado de 150 °C a 350 °C.]
- DA rester (råolie), dampkrakket varemeudblødt naphtha , Krakket gasolie
[En sammensat blanding af carbonhydrier, opnået som rest fra destillationen af dampkrakket varmeudblødt naphtha, med koges-interval omtrent fra 150 °C til 350 °C.]
- DE Rückstände (Erdöl), dampfgekrackte Wärme-Soaker Naphtha , Krackgasöl
[Komplexe Kombination von Kohlenwasserstoffen, die man als Rückstand aus der Destillation von dampfgekrackter Naphtha aus dem Wärme-Soaker erhält und im Bereich von etwa 150 °C bis 350 °C siedet.]
- EL υπολείμματα (πετρελαίου), παρατεταμένης θέρμανσης ατμοπυρολυμένης ναφθας. Πετρέλαιο από διάσπαση
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται σαν υπόλειμμα από την απόσπαση παρατεταμένης θέρμανσης ατμοπυρολυμένης νάφθας και περιοχή θρασμού από 150° C έως 350° C περίπου.]
- EN Residues (petroleum), steam-cracked heat-soaked naphtha , Cracked gasoil
[A complex combination of hydrocarbons obtained as residue from the distillation of steam cracked heat soaked naphtha and boiling in the range of approximately 150 °C to 350 °C (302 °F to 662 °F)]
- FR résidus (pétrole), naphtha de vapocraquage, maturation , Gazole de craquage
[Combinaison complexe d'hydrocarbures obtenue comme résidu de la distillation de naphtha de vapocraquage ayant subi une maturation, et dont le point d'ébullition est compris approximativement entre 150 °C et 350 °C.]
- IT residui (petrolio), nafta da immersione di calore (« heat soaking ») e cracking con vapore , Gasolio da cracking
[Combinazione complessa di idrocarburi ottenuta come residuo della distillazione di nafta da immersione di calore (« heat soaking ») e cracking con vapore e con punto di ebollizione nell'intervallo 150 °C-350 °C ca.]
- NL residuen (aardolie), stoomgekraakte uitputtend verhitte nafta , Gekraakte gasolie
[Een complexe verzameling koolwaterstoffen die wordt verkregen als residu uit de destillatie van stoomgekraakte uitputtend verhitte nafta, met een kooktraject van ongeveer 150 °C tot 350 °C.]
- PT residuos (petróleo), de nafta aquecida do steam-cracking , Gasóleo de « cracking »
[Uma combinação complexa de hidrocarbonetos obtida como com residuo da destilação dos produtos de nafta aquecida do steam-cracking e que destila no intervalo de aproximadamente de 150 °C até 350 °C.]

NOTA H

- ES** hidrocarburos, C_{16-20} , residuo de destilación parafínico hidrocraqueado desparafinado con disolvente Gasóleo craqueado
[Combinación compleja de hidrocarburos obtenida por desparafinación con disolvente de un residuo de destilación de un destilado parafínico hidrocraqueado. Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_{16} a C_{20} y con un intervalo de ebullición aproximado de 360 °C a 500 °C. Produce un aceite final con una viscosidad de 4,5 cSt a aproximadamente 100 °C.]
- DA** carbonhydrider, C_{16-20} , solvent-afvokset hydrokrakket paraffindestillationsrest Krakket gasolie
[En sammensat blanding af carbonhydrider opnået ved solventafvoksning af en destillationsrest fra et hydrokrakket paraffindestillat. Den består overvejende af carbonhydrider, overvejende fra C_{16} til og med C_{20} , med kogesinterval omtrent fra 360 °C til 500 °C. Den danner en færdig olie med en viskositet på 4,5 cSt ved omtrent 100 °C.]
- DE** Kohlenwasserstoffe, C_{16-20} durch Lösungsmittel entwachst hydrogekrackt paraffinhaltig Destillationsrückstand Krackgasöl
[Komplexe Kombination von Kohlenwasserstoffen, die man durch Entwachsen eines Destillationsrückstandes aus hydrogekracktem paraffinhaltigen Destillat durch Lösungsmittel erhält. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{16} bis C_{20} und siedet im Bereich von etwa 360 °C bis 500 °C. Ergibt ein Fertigöl mit einer Viskosität von 4,5 cSt bei etwa 100 °C.]
- EL** υδρογονάνθρακες, C_{16-20} , αποκηρωμένου με διαλύτη υδρογονοπυρολυμένου παραφινικού υπολειμματος απόσταξης Πετρέλαιο από διάσπαση
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται από την αποκήρωση με διαλύτη υπολειμματος απόσταξης υδρογονοπυρολυμένου παραφινικού αποσταγματος. Συνίσταται κυρίως από υδρογονανθρακες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{16} έως και C_{20} και με περιοχή δράσμου από 360 °C έως 500 °C περίπου. Παράγει έτοιμο έλαιο που έχει ισχύος 4,5 cSt στους 100 °C.]
- EN** Hydrocarbons, C_{16-20} , solvent-dewaxed hydrocracked paraffinic distn. residue, Cracked gasoil
[A complex combination of hydrocarbons obtained by solvent dewaxing of a distillation residue from a hydrocracked paraffinic distillate. It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_{16} through C_{20} and boiling in the range of approximately 360 °C to 500 °C (680 °F to 932 °F). It produces a finished oil having a viscosity of 4,5 cSt at approximately 100 °C (212 °F).]
- FR** hydrocarbures en C_{16-20} , résidu de distillation paraffinique, hydrocraquage et déparaffinage au solvant Gazole de craquage
[Combinaison complexe d'hydrocarbures obtenue par déparaffinage au solvant d'un résidu de distillation issu d'un distillat paraffinique ayant subi un hydrocraquage. Se compose principalement d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{16} - C_{20} et dont le point d'ébullition est compris approximativement entre 360 °C et 500 °C, donne une huile-produit fini de viscosité égale à 4,5 cSt à environ 100 °C.]
- IT** idrocarburi, C_{16-20} , residuo della distillazione di paraffine da idrocracking decerati con solvente Gasolio da cracking
[Combinazione complessa di idrocarburi ottenuta per decerazione con solvente di un residuo della distillazione da un distillato paraffinico da idrocracking. È costituita prevalentemente da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{16} a C_{20} e con intervallo di ebollizione 360 °C-500 °C ca. Produce un olio finito avente viscosità di 4,5 cSt a 100 °C.]
- NL** koolwaterstoffen, C_{16-20} , met solvent van was ontdaan waterstofgekraakt paraffinisch destillatieresidu Gekraakte gasolie
[Een complexe verzameling koolwaterstoffen die wordt verkregen door het met solvent van was ontdoen van een waterstofgekraakt paraffinisch destillaat. Bestaat voornamelijk uit koolwaterstoffen overgaand C_{16} tot en met C_{20} , met een kooktraject van ongeveer 360 °C tot 500 °C. Het vormt een voltooide olie met een viscositeit van 4,5 cSt bij ongeveer 100 °C.]
- PT** hidrocarbonetos, C_{16-20} , residuo da destilação de destilado parafínico do hidrocracking desparafinado com solvente Gasóleo de cracking
[Uma combinação complexa de hidrocarbonetos obtida por desparafinação com solvente de um residuo da destilação do produto do hidrocracking de um destilado parafínico. É constituída predominantemente por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_{16} até C_{20} e destila no intervalo de aproximadamente 360 °C a 500 °C. Produz um óleo acabado com uma viscosidade de 4,5 cSt a aproximadamente 100 °C.]

[En sammensat blanding af carbonhydrider fra destillation af produkterne fra en hydrokrakningsproces. Den består overvejende af mættede carbonhydrider, C_{11} - C_{16} , med koginterval omtrent fra 260 °C til 600 °C]
- DE Destillate (Erdöl), schwere hydrogekrackte , Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen aus der Destillation von Produkten aus einem Hydrokrackverfahren. Besteht vorherrschend aus gesättigten Kohlenwasserstoffen mit Kohlenstoffzahlen im Bereich von C_{11} bis C_{16} und siedet im Bereich von etwa 260 °C bis 600 °C]
- EL αποσταγμάτα (πετρελαίου), βαριά υδρογονοπυρλούμενα. Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολύπλοκος συνδυασμός υδρογονανθράκων από την απόσταξη των προϊόντων υδρογονοπυρόλυσης. Συνίσταται κυρίως από κορεσμένους υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{11} έως και C_{16} και με περιχή θρασμού από 260° C έως 600° C περίπου]
- EN Distillates (petroleum), heavy hydrocracked , Baseoil — unspecified
[A complex combination of hydrocarbons from the distillation of the products from a hydrocracking process. It consists predominantly of saturated hydrocarbons having carbon numbers in the range of C_{11} - C_{16} and boiling in the range of approximately 260 °C to 600 °C (500 °F to 1112 °F)]
- FR distillats lourds (petrole), hydrocraquage , Huile de base — non spécifié
[Combinaison complexe d'hydrocarbures obtenue par distillation des produits résultant d'un hydrocraquage. Se compose principalement d'hydrocarbures saturés dont le nombre de carbones se situe en majorité dans la gamme C_{11} - C_{16} , et dont le point d'ébullition est compris approximativement entre 260 °C et 600 °C]
- IT: distillati (petrolio), frazioni pesanti di idrocracking , Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuti dalla distillazione dei prodotti di un processo di idrocracking. È costituita prevalentemente da idrocarburi saturi con numero di atomi di carbonio nell'intervallo C_{11} - C_{16} , e punto di ebollizione nell'intervallo 260 °C -600 °C ca.]
- NL . destillaten (aardolie), zwaar waterstofgekraakt , Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen, verkregen door destillatie van de produkten van een waterstofkraakproces. Bestaat voornamelijk uit verzadigde koolwaterstoffen, overwegend C_{11} - C_{16} , met een kooktraject van ongeveer 260 °C tot 600 °C]
- PT destilados (petroleo), pesados do hidrocracking ; Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos da destilação dos produtos de um processo de hidrocracking. É constituída predominantemente por hidrocarbonetos saturados com números de átomos de carbono na gama de C_{11} até C_{16} , e destila no intervalo de aproximadamente 260 °C a 600 °C]

NOTA H

NOTA L

- ES destilados (petróleo), fracción parafínica pesada con disolvente, Aceite de base, sin especificar
[Combinación compleja de hidrocarburos obtenida como el refinado de un proceso de extracción con disolvente. Compuesta fundamentalmente de hidrocarburos saturados con un número de carbonos en su mayor parte dentro del intervalo de C_{20} a C_{40} y produce un aceite final con una viscosidad de al menos 19cSt a 40 °C (100 SUS a 100 °F)]
- DA destillater (råolie), solventraffinerede tunge paraffin-, Uspecificeret baseolie
[En sammensat blanding af carbonhydrider opnået som raffinatet fra en solventekstraktionsproces. Den består overvejende af mættede carbonhydrider, overvejende C_{20} til og med C_{40} , og danner en færdig olie med en viskositet på mindst 19cSt ved 40 °C]
- DE Destillate (Erdöl), Lösungsmittel-aufbereitete schwere paraffinhaltige, Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen, erhalten als Raffinat aus einem Lösungsmittelextraktionsverfahren. Besteht vorherrschend aus gesättigten Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{20} bis C_{40} und ergibt ein Fertigöl mit einer Viskosität von mindestens 19 cSt bei 40 °C]
- EL αποστάγματα (πετρελαίου), θαρέα παραφινικά εξευγενισμένα με διαλύτη Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολύπλοκος συνδυασμός υδρογονανθράκων που λαμβάνεται σαν εκχυλισμένο προϊόν εκχύλισης με διαλύτη. Συνίσταται κυρίως από κορεσμένους υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{20} έως και C_{40} και παράγει τελικό έλαιο με ιξώδες μικρότερο από 19cSt σε 40 °C]
- EN Distillates (petroleum), solvent-refined heavy paraffinic, Baseoil — unspecified
[A complex combination of hydrocarbons obtained as the raffinate from a solvent extraction process. It consists predominantly of saturated hydrocarbons having carbon numbers predominantly in the range of C_{20} through C_{40} and produces a finished oil with a viscosity of at least 100 SUS at 100 °F (19cSt at 40 °C)]
- FR distillats paraffiniques lourds (pétrole), raffinés au solvant, Huile de base — non spécifié
[Combinaison complexe d'hydrocarbures obtenue comme raffinat lors d'une extraction au solvant. Se compose principalement d'hydrocarbures saturés dont le nombre de carbones se situe en majorité dans la gamme C_{20} - C_{40} , et donne une huile-produit fini de viscosité supérieure à 19 cSt à 40 °C]
- IT distillati (petrolio), frazione paraffinica pesante raffinata con solvente, Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta come raffinato da un processo di estrazione con solvente. È costituita prevalentemente da idrocarburi saturi con numero di atomi di carbonio prevalentemente nell'intervallo C_{20} - C_{40} e produce un olio finito di viscosità pari ad almeno 19cSt a 40 °C]
- NL destillaten (aardolie), solvent-geraffineerde zware paraffinische, Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen verkregen als het raffinaat van een solvent-extractieproces. Bestaat voornamelijk uit verzadigde koolwaterstoffen, overwegend C_{20} tot en met C_{40} , en vormt een voltooide olie met een viscositeit van minstens 19 cSt bij 40 °C]
- PT: destilados (petróleo), parafínicos pesados refinados com solvente; Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos obtida como o refinado de um processo de extração com solvente. É constituída predominantemente por hidrocarbonetos saturados com números de átomos de carbono predominantemente na gama de C_{20} até C_{40} e produz um óleo acabado com uma viscosidade mínima de 19cSt a 40 °C.]

Besteht aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend höher als C_{11} , und siedet über etwa 400 °C]
- EL υπολειμματικά έλαια (πετρελαίου), εξευγενισμένα με διαλυτή Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται σαν το αδιάλυτο σε διαλυτή κλάσμα από εξευγενισμό με διαλυτή υπολείμματος, με χρήση πολικού οργανικού διαλυτή όπως φαινόλη και φουρφουράλη. Συνίσταται από υδρογονανθράκες με αριθμό ατόμων άνθρακα σημαντικά μεγαλύτερο από C_{11} , και βράζει πάνω από 400 °C περίπου]
- EN Residual oils (petroleum,) solvent-refined , Baseoil — unspecified
[A complex combination by hydrocarbons obtained as the solvent insoluble fraction from solvent refining of a residuum using a polar organic solvent such as phenol or furfural. It consists of hydrocarbons having carbon numbers predominantly higher than C_{11} and boiling above approximately 400 °C (752 °F)]
- FR huiles résiduelles (petrole), raffinées au solvant , Huile de base — non spécifié
[Combinaison complexe d'hydrocarbures obtenue comme fraction insoluble lors du raffinage d'un residu avec un solvant organique polaire tel que phenol ou furfural. Se compose d'hydrocarbures dont le nombre de carbones est en majorite superieur a C_{11} , et dont le point d'ebullition est approximativement superieur a 400 °C]
- IT olii residui (petrolio), raffinati con solvente ; Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta come frazione insolubile in solventi dalla raffinazione con solvente di un residuo, con l'impiego di un solvente organico polare quale il fenolo o il furfurolo. È costituita prevalentemente da idrocarburi a numero di atomi di carbonio prevalentemente superiore a C_{11} , e a punto di ebollizione superiore a 400 °C ca]
- NL . residu-olien (aardolie), solvent-geraffineerd , Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen, verkregen als de in solvent onoplosbare fractie van solvent-raffinering van een residu met behulp van een polair organische solvent zoals fenol of furfural. Bestaat uit koolwaterstoffen overwegend groter dan C_{11} , kokend boven ongeveer 400 °C]
- PT oleos residuais (petróleo), refinados com solvente , Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos obtida como a fracção insolúvel em solvente de refinação com solvente de um residuo usando um solvente orgânico polar como fenol ou furfural. É constituída por hidrocarbonetos com numeros de atomos de carbono predominantemente superiores a C_{11} , e destila acima de aproximadamente 400 °C]

NOTA L

- ES** destilados (petroleo), fraccion parafinica pesada tratada con arcilla, Aceite de base, sin especificar
[Combinacion compleja de hidrocarburos resultante del tratamiento de una fraccion de petroleo con arcilla natural o modificada en cualquiera de los procesos de contacto o percolacion para separar las trazas presentes de compuestos polares e impurezas. Compuesta de hidrocarburos con un numero de carbonos en su mayor parte dentro del intervalo de C_{20} a C_{40} y produce un aceite final con una viscosidad de al menos 19cSt a 40 °C (100 SUS a 100 °F). Contiene una proporcion relativamente grande de hidrocarburos saturados.]
- DA** destillater (råolie), lerbehandlede tunge paraffin-, Uspecificeret baseolie
[En sammensat blanding af carbonhydrider fremkommet ved behandling af en råoliefraktion med naturligt eller modificeret ler, enten en kontakt- eller perkoleringsproces, til fjernelse af spormængderne af polære forbindelser og tilstedeværende urenheder. Den består af carbonhydrider, overvejende C_{20} til og med C_{40} , og danner en færdig olie med en viskositet på mindst 19cSt ved 40 °C. Den indeholder en forholdsvis stor del mættede carbonhydrider.]
- DE** Destillate (Erdöl), Ton-behandelte schwere paraffinhaltige, Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen, entsteht durch Behandeln einer Erdölfraktion mit natürlichem oder modifiziertem Ton in entweder einem Kontakt- oder Perkulationsverfahren zum Entfernen von Spuren polarer Verbindungen und von vorhandenen Verunreinigungen. Besteht aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{20} bis C_{40} und ergibt ein Fertigöl mit einer Viskosität von mindestens 19 cSt bei 40 °C. Enthält eine relativ große Menge gesättigter Kohlenwasserstoffe.]
- EL** αποσταγμάτα (πετρελαιο), βαρεα παραφινικά κατεργασμένα με αρνίλλο Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολυπλοκός συνδυασμός υδρογονανθράκων που προκύπτει από κατεργασία κλάσματος πετρελαιο με φυσική ή τροποποιημένη αρνίλλο είτε με διεργασία επαφής, είτε με διήθηση για να απομακρυνθούν ιχνοποσότητες πολικών ενώσεων και υπάρχουσες προσμίξεις. Συνίσταται από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{20} έως και C_{40} και παράγει τελικό έλαιο με ιξώδες τουλάχιστον 19cSt σε 40 °C. Περιέχει σχετικά μεγάλη αναλογία κορεσμένων υδρογονανθράκων.]
- EN** Distillates (petroleum), clay-treated paraffinic, Baseoil — unspecified
[A complex combination of hydrocarbons resulting from treatment of a petroleum fraction with natural or modified clay in either a contacting or percolation process to remove the trace amounts of polar compounds and impurities present. It consists of hydrocarbons having carbon numbers predominantly in the range of C_{20} through C_{40} and produces a finished oil with a viscosity of at least 100 SUS at 100 °F (19cSt at 40 °C). It contains a relatively large proportion of saturated hydrocarbons.]
- FR** distillats paraffiniques lourds (petrole), traites a la terre, Huile de base — non spécifié
[Combinaison complexe d'hydrocarbures résultant du traitement d'une fraction pétrolière avec de l'argile naturelle ou modifiée, par contact ou par percolation, destinée à éliminer les traces de composés polaires et les impuretés. Se compose d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{20} - C_{40} et donne une huile-produit fini de viscosité supérieure à 19 cSt à 40 °C. Contient une proportion relativement importante d'hydrocarbures saturés.]
- IT** distillati (petrolio), frazione paraffinica pesante trattata con argilla, Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta dal trattamento di una frazione di petrolio con argilla naturale o modificata, in un processo di contatto o di percolazione per eliminare le tracce di composti polari e impurezze presenti. È costituita da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{20} - C_{40} e produce un olio finito con viscosità di almeno 19cSt a 40 °C. Contiene una percentuale relativamente alta di idrocarburi saturi.]
- NL** destillaten (aardolie), met klei behandelde zware paraffinehoudende, Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen door de behandeling van een aardoliefractie met natuurlijke of gemodificeerde klei in een contact- of een filtratieproces waarbij sporen van polaire verbindingen en aanwezige onzuiverheden worden verwijderd. Bestaat uit koolwaterstoffen, overwegend C_{20} tot en met C_{40} , en vormt een voltooide olie met een viscositeit die minstens 19 cSt is bij 40 °C. Bevat een relatief grote hoeveelheid verzadigde koolwaterstoffen.]
- PT** destilados (petroleo), parafinicos pesados tratados com argila, Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos resultante do tratamento de uma fracção petrolífera com argila natural ou modificada quer por mistura quer por percolação para remoção de vestígios de compostos polares e impurezas presentes. É constituída por hidrocarbonetos com numeros de atomos de carbono predominantemente na gama de C_{20} ate C_{40} e produz um óleo acabado com uma viscosidade minima de 19cSt a 40 °C. Contem uma proporção relativamente elevada de hidrocarbonetos saturados.]

Enthält relativ wenig normale Paraffine.]
- EL αποσταγµατα (πετρελαιο), ελαφρα ναφθενικα, κατεργασµενα µε αργιλλο Βασικο ορυκτελαιο — µη προδιαγεγραµµενο
[Πολυπλοκος συνδυασµος υδρογονανθρακων που προκυπτει απο κατεργασια κλασµατος πετρελαιου µε φυσικη η τροποποιηµενη αργιλλο, ειτε µε διεργασία επαφης, ειτε διηθησης για να αποµακρυνθουν ιχνοποσοτητες ενωσεων και υπαρχουσες προσµιξεις. Συνισταται απο υδρογονανθρακες µε αριθµο ατοµων ανθρακα κυριως στην περιοχη απο C_{11} εως και C_{30} και παραγει τελικο ελαιο µε ισως, µικροτερο απο 19cSt σε 40 °C. Περιχει σχετικως λιγες κανονικες παραφινες.]
- EN Distillates (petroleum), clay-treated light naphthenic Baseoil — unspecified
[A complex combination of hydrocarbons resulting from treatment of a petroleum fraction with natural or modified clay in either a contacting or percolation process to remove the trace amounts of polar compounds and impurities present. It consists of hydrocarbons having carbon numbers predominantly in the range of C_{11} through C_{30} and produces a finished oil with a viscosity of less than 100 SUS at 100 °F (19cSt at 40 °C). It contains relatively few normal paraffins.]
- FR distillats naphtheniques legers (petrole), traites a la terre, Huile de base — non spécifique
[Combinaison complexe d'hydrocarbures resultant du traitement d'une fraction petroliere avec de l'argile naturelle ou modifiée, par contact ou par percolation, destinée à éliminer les traces de composés polaires et les impuretés. Se compose d'hydrocarbures dont le nombre de carbones se situe en majorite dans la gamme C_{11} - C_{30} , et donne une huile-produit fini de viscosité inférieure à 19 cSt a 40 °C. Contient relativement peu de paraffines normales.]
- IT distillati (petrolio), frazione naftenica leggera trattata con argilla, Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta dal trattamento di una frazione di petrolio con argilla naturale o modificata, in un processo o di percolazione per eliminare le tracce di composti polari e impurezze presenti. È costituita da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{11} - C_{30} e produce un olio finito con viscosità di almeno 19cSt a 40 °C. Contiene relativamente poche paraffine normali.]
- NL destillaten (aardolie), met klei behandelde lichte naftenhoudende, Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen door behandeling van een aardoliefractie met een natuurlijke of gemodificeerde klei in een contact- of een filtratieproces waarbij sporen van polaire verbindingen en aanwezige onzuiverheden worden verwijderd. Bestaat uit koolwaterstoffen, overwegend C_{11} tot en met C_{30} , en vormt een voltooide olie met een viscositeit die kleiner is dan 19 cSt bij 40 °C. Bevat relatief weinig normale paraffinen.]
- PT destilados (petroleo), naftenicos leves tratados com argila, Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos resultante do tratamento de uma fracção petrolífera com argila natural ou modificada quer por mistura quer por percolação para remoção de vestígios de compostos polares e impurezas presentes. É constituída por hidrocarbonetos com numeros de atomos de carbono predominantemente na gama de C_{11} ate C_{30} e produz um oleo acabado com uma viscosidade inferior a 19cSt a 40 °C. Contem relativamente poucas parafinas normais.]

NOTA L

- ES aceites lubricantes (petróleo), C_{20-40} , basados en aceite neutro tratado con hidrógeno, elevada viscosidad; Aceite de base, sin especificar.
[Combinación compleja de hidrocarburos obtenida por tratamiento con hidrógeno de gasóleo ligero obtenido a vacío, gasóleo pesado obtenido a vacío y aceite residual desasfaltado con disolvente en presencia de un catalizador en un proceso en dos etapas efectuando un desparafinado entre ambas etapas. Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_{20} a C_{40} y produce un aceite final con una viscosidad de aproximadamente 112cSt a 40 °C. Contiene una proporción relativamente grande de hidrocarburos saturados.]
- DA smørelier (råolie), C_{20-40} , hydrogenbehandlede olie baseret, høj viskositet; Uspecificeret baseolie.
[En sammensat blanding af carbonhydrider opnået ved at behandle let vakuumgasolie, tung vakuumgasolie og solvent afasfalteret restolie med hydrogen, i tilstedeværelse af en katalysator, i en to trinproces med afvoksning udført mellem de to trin. Den består overvejende af carbonhydrider, overvejende C_{20} til C_{40} og med C_{20} og danner en færdig olie med en viskositet på omtrent 112cSt ved 40 °C. Den indeholder en relativ stor mængde af mættede carbonhydrider.]
- DE Schmieröle (Erdöl), C_{20-40} , mit Wasserstoff behandelte neutrale aus Öl, hohe Viskosität; Grundöl-nicht spezifiziert.
[Komplexe Kombination von Kohlenwasserstoffen, erhalten durch Behandeln von leichtem Vakuumgasöl, schwerem Vakuumgasöl und durch Lösungsmittel desasphaltiertem Rückstandsöl mit Wasserstoff in Gegenwart eines Katalysators in zwei Stufen, mit Entwaschen zwischen beiden Stufen. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{20} bis C_{40} und ergibt ein Fertigöl mit einer Viskosität von etwa 112 cSt bei 40 °C. Enthält eine relativ große Menge gesättigter Kohlenwasserstoffe.]
- EL λιπαντικά ελαία (πετρελαίου), C_{20-40} , υδρογονοκατεργασμένα βάσης ουδέτερου ελαίου, υψηλού ιξώδους. Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο.
[Πολύπλοκος συνδυασμός υδρογονανθράκων που λαμβάνεται με κατεργασία με υδρογόνο παρουσία καταλύτη, ελαφρού ακαθάρτου πετρελαίου κενού, βαρέος ακαθάρτου πετρελαίου κενού και υπολειμματικού ελαίου απασφαλτωμένου με διαλύτη σε δύο στάδια με την αποκρήση να γίνεται μεταξύ των δύο σταδίων. Συνίσταται κυρίως από υδρογονάνθρακες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{20} έως και C_{40} και παράγει τελικό έλαιο με ιξώδες 112cSt σε 40 °C. Περιλαμβάνει σχετική μεγάλη αναλογία κορεσμένων υδρογονανθράκων.]
- EN Lubricating oils (petroleum), C_{20-40} , hydrotreated neutral oil-based, high-viscosity; Baseoil-unspecified.
[A complex combination of hydrocarbons obtained by treating light vacuum gas oil, heavy vacuum gas oil, and solvent deasphalted residual oil with hydrogen in the presence of a catalyst in a two stage process with dewaxing being carried out between the two stages. It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_{20} through C_{40} and produces a finished oil having a viscosity of approximately 112cSt at 40 °C. It contains a relatively large proportion of saturated hydrocarbons.]
- FR huiles lubrifiantes (pétrole), C_{20-40} , base huile neutre, hydrotraitement, viscosité élevée; Huile de base — non spécifiée.
[Combinaison complexe d'hydrocarbures obtenue, à partir de gazole sous-vide, léger et lourd, et d'huile résiduelle désasphaltée au solvant, par traitement à l'hydrogène en présence d'un catalyseur, en deux étapes entrecoupées d'un déparaffinage. Se compose principalement d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{20} - C_{40} et donne une huile-produit fini de viscosité approximativement égale à 112 cSt à 40 °C. Contient une proportion relativement importante d'hydrocarbures saturés.]
- IT olii lubrificanti (petrolio), C_{20-40} , a base di olio neutro, alto viscosità, idrottrattati; Olio base — non specificato.
[Combinazione complessa di idrocarburi ottenuto trattando con idrogeno in presenza di un catalizzatore un gasolio leggero e un gasolio pesante ottenuti sotto vuoto e un olio residuo desasfaltato con solvente, in due fasi, interponendo fra esse la deparaffinazione. E costituita prevalentemente da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{20} - C_{40} e produce un'olio finito con viscosità di circa 112cSt a 40 °C. Contiene una percentuale relativamente alta di idrocarburi saturi.]
- NL smeeroliën (aardolie), C_{20-40} , met waterstof behandelde uit neutrale olie verkregen, hoge viscositeit; Basisolie — niet gespecificeerd.
[Een complexe verzameling koolwaterstoffen, verkregen door de behandeling van lichte vacuümgasolie, zware vacuümgasolie en solvent-gedeasfalterde residu-olie met waterstof in de aanwezigheid van een katalysator in een proces met twee fasen met tussen de fasen in verwijdering van was. Bestaat voornamelijk uit koolwaterstoffen, overwegend C_{20} tot en met C_{40} , en vormt een voltooide olie met een viscositeit van ongeveer 112 cSt bij 40 °C. Bevat een relatief grote hoeveelheid verzadigde koolwaterstoffen.]
- PT oleos lubrificantes (petróleo), C_{20-40} , óleo base neutro tratado com hidrogénio, de viscosidade elevada; Óleo-base não especificado.
[Uma combinação complexa de hidrocarbonetos obtida por tratamento com hidrogénio na presença de um catalisador, em duas etapas, de gasóleo leve de vácuo, gasóleo pesado de vácuo e resíduo desasfaltado com solvente, sendo submetidos a uma operação de desparafinação entre as duas etapas. É constituído predominantemente por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_{20} até C_{40} e produz um óleo acabado com uma viscosidade de aproximadamente 112cSt a 40 °C. Contém uma proporção relativamente elevada de hidrocarbonetos saturados.]

- IT distillati (petrolio), paraffinici leggeri deparaffinati complessi , Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta dalla deparaffinazione di un distillato paraffinico leggero. Costituito prevalentemente da idrocarburi con numero di atomi di carbonio nell'intervallo C_{12} , C_{30} e produce un olio finito con una viscosità minore di 19cSt a 40°C. Contiene relativamente poche paraffine normali]
- NL destillaten (aardolie), complexe van was ontdane lichte paraffinehoudende , Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen door het verwijderen van was uit een licht paraffinehoudend destillaat. Bestaat voornamelijk uit koolwaterstoffen, overwegend C_{12} tot en met C_{30} en vormt een voltooide olie met een viscositeit kleiner dan 19 cSt bij 40°C. Bevat relatief weinig normale paraffinen]
- PT destilados (petroleo), parafinicos leves desparafinados complexos , Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos obtida por desparafinagem de destilados parafinicos leves. É constituída predominantemente por hidrocarbonetos com numeros de atomos de carbono predominantemente na gama de C_{12} ate C_{30} e produz um oleo acabado com uma viscosidade inferior a 19cSt a 40°C. Contem relativamente poucas parafinas normais]

Compuesta fundamentalmente de hidrocarburos saturados con un número de carbonos en su mayor parte dentro del intervalo de C_{11} a C_{14} , y produce un aceite final con una viscosidad aproximada de 13 cSt a 50 °C]
- DA** destillater (råolie), afvoksede lette paraffin-, hydrogenbehandlede, Uspecificeret baseolie
[En sammensat blanding af carbonhydrider opnået fra en intensiv hydrogenbehandling af afvoksede destillater i tilstedeværelse af en katalysator. Den består overvejende af mættede carbonhydrider, overvejende C_{11} til og med C_{14} , og danner en færdig olie med en viskositet på omtrent 13 cSt ved 50 °C]
- DE** Destillate (Erdöl), entwachste leichte paraffinhaltige, mit Wasserstoff behandelt, Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen die man aus intensiver Behandlung von entwachstem Destillat durch Hydrierung in Gegenwart eines Katalysators erhält. Besteht vorherrschend aus gesättigten Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{11} bis C_{14} und ergibt ein Fertigöl mit einer Viskosität von etwa 13 cSt bei 50 °C]
- EL** αποσταγµατα (πετρελαιο), ελαφρα παραφινικα αποκηρωµενα, υδρογονοκατεργασµενα· Βασικο ορυκτέλαιο — μη προδιαγεγραµµένο
[Πολυπλοκος συνδυασµός υδρογονανθρακων που λαμβανεται από εντονη κατεργασία αποκηρωµένου αποσταγµατος με υδρογόνωση παρουσία καταλύτη. Συνιστάται κυρίως από κορεσµένους υδρογονανθρακες με αριθµό ατόμων ανθρακα κυρίως στην περιοχή από C_{11} έως και C_{14} και παραγει τελικό ελαιο με ιξώδες περίπου 13 cSt σε 50 °C]
- EN** Distillates (petroleum), dewaxed light paraffinic, hydrotreated, Baseoil — unspecified
[A complex combination of hydrocarbons obtained from an intensive treatment of dewaxed distillate by hydrogenation in the presence of a catalyst. It consists predominantly of saturated hydrocarbons having carbon numbers predominantly in the range of C_{11} through C_{14} , and produces a finished oil with a viscosity of approximately 13 cSt at 50 °C]
- FR** distillats paraffiniques légers (petrole), deparaffinés, hydrotraités, Huile de base — non spécifiée
[Combinaison complexe d'hydrocarbures obtenue par traitement intensif d'un distillat deparaffiné consistant en une hydrogenation en présence d'un catalyseur. Se compose principalement d'hydrocarbures saturés dont le nombre de carbones se situe en majorité dans la gamme C_{11} , C_{14} , et donne une huile-produit fini de viscosité voisine de 13 cSt a 50 °C]
- IT** distillati (petrolio), paraffinici leggeri deparaffinati, idrotrattati, Olio base — non specificato
[Combinazione complessa di idrocarburi da un trattamento intensivo di distillato deparaffinato per idrogenazione in presenza di un catalizzatore. È costituita prevalentemente da idrocarburi con un numero di atomi di carbonio prevalentemente nell'intervallo C_{11} - C_{14} , e produce un olio finito con viscosità di 13 cSt a 50 °C ca.]
- NL** destillaten (aardolie), van was ontdane paraffinehoudende lichte, met waterstof behandeld, Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen uit een intensieve behandeling van een van was ontdaan destillaat door hydrogenering in de aanwezigheid van een katalysator. Bestaat voornamelijk uit verzadigde koolwaterstoffen, overwegend C_{11} tot en met C_{14} , en vormt een voltooide olie met een viscositeit van ongeveer 13 cSt bij 50 °C]
- PT** destilados (petróleo), parafínicos leves desparafinados, tratados com hidrogenio, Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos obtida de um tratamento intensivo de um destilado desparafinado por hidrogenação na presença de um catalisador. É constituída predominantemente por hidrocarbonetos saturados com números de átomos de carbono predominantemente na gama de C_{11} até C_{14} , e produz um óleo acabado com uma viscosidade de aproximadamente 13 cSt a 50 °C]

NOTA H

NOTA L

- ES : destilados (petróleo), tracción ligera refinada con disolvente hidrocraqueado ; Aceite de base, sin especificar
[Combinación compleja de hidrocarburos obtenida por el tratamiento con disolvente de un destilado de destilados de petróleo hidrocraqueados. Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_{18} a C_{27} , y con un intervalo de ebullición aproximado de 370 °C a 450 °C.]
- DA : destillater (råolie), hydrokrakkede solventraffinerede lette ; Uspecificeret baseolie
[En sammensat blanding af carbonhydrier opnået ved solventbehandling af et destillat fra hydrokrakkede råoliedestillater. Den består overvejende af carbonhydrier, overvejende C_{18} til og med C_{27} , med koginterval omtrent fra 370 °C til 450 °C.]
- DE : Destillate (Erdöl), hydrogekrackte durch Lösungsmittel aufbereitete leichte ; Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen, die man durch Lösungsmittelbehandlung eines Destillates aus hydrogekrackten Erdöldestillaten erhält. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{18} bis C_{27} , und siedet im Bereich von etwa 370 °C bis 450 °C.]
- EL : αποσταγμάτα (πετρελαιο), ελαφρά κατεργασμένα με υδρογόνο εξευγενισμένα με διαλύτη· Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται με κατεργασία με διαλύτη αποσταγμάτων από τα υδρογονοπυρολυμένα αποσταγμάτα πετρελαίου. Συνίσταται κυρίως από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{18} έως και C_{27} , και με περιοχή βρασμού από 370 °C έως 450 °C περίπου.]
- EN : Distillates (petroleum), hydrocracked solvent-refined light ; Baseoil — unspecified
[A complex combination of hydrocarbons obtained by the solvent treatment of a distillate from hydrocracked petroleum distillates. It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_{18} through C_{27} , and boiling in the range of approximately 370 °C to 450 °C (698 °F to 842 °F).]
- FR : distillats légers (pétrole), raffinés au solvant, hydrocraquage ; Huile de base — non spécifique
[Combinaison complexe d'hydrocarbures obtenue par traitement au solvant d'un distillat tiré de distillats pétroliers ayant subi un hydrocraquage. Se compose principalement d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{18} - C_{27} , et dont le point d'ébullition est compris approximativement entre 370 °C et 450 °C.]
- IT : distillati (petrolio), frazione leggera idrocrackizzata raffinata con solvente ; Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta mediante trattamento con solvente di distillato da distillati di petrolio idrocrackizzato. Costituita prevalentemente da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{18} - C_{27} , e con un intervallo di ebollizione 370 °C-450 °C ca.]
- NL : destillaten (aardolie), waterstofgekraakte solventgezuiverde lichte fractie ; Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen door de solventbehandeling van een distillaat van met waterstof gekraakte aardolie destillaten. Bestaat voornamelijk uit koolwaterstoffen, overwegend C_{18} tot en met C_{27} , met een kooktraject van ongeveer 370 °C tot 450 °C.]
- PT : destilados (petróleo), leves do hidrocracking refinados com solvente ; Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos obtida pelo tratamento com solvente de um destilado de destilados petrolíferos do hidrocracking. É constituída predominantemente por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_{18} até C_{27} , e destila no intervalo de aproximadamente 370 °C a 450 °C.]

NOTA H

NOTA L

- ES** hidrocarburos, C_{1-10} , residuo de destilación atmosférica desasfaltado con disolvente tratado con hidrogeno, fracciones ligeras de destilación, Aceite de base, sin especificar
[Combinación compleja de hidrocarburos obtenida como primeros productos de la destilación a vacío de efluentes del tratamiento de un residuo pequeño desasfaltado con disolvente con hidrógeno en presencia de un catalizador. Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_{1-10} y con un intervalo de ebullición aproximado de 300 °C a 400 °C. Produce un aceite final con una viscosidad de 4cSt a aproximadamente 100 °C]
- DA** carbonhydrider, C_{1-10} , hydrogenbehandlet solvent-afasfalteret atmosfærisk destillationsrest, lette destillater, Uspecificeret baseolie
[En sammensat blanding af carbonhydrider opnået som torløb fra vakuumdestillationen af udløb fra behandlingen af en solvent-afasfalteret kort rest med hydrogen i tilstedeværelse af en katalysator. Den består overvejende af carbonhydrider, overvejende fra C_{1-10} , til og med C_{10} , med kogesinterval omtrent fra 300 °C til 400 °C. Den danner en færdig olie med en viskositet på 4cSt ved omtrent 100 °C]
- DE** Kohlenwasserstoffe, C_{1-10} , mit Wasserstoff behandelt durch Lösungsmittel deasphaltiert offene Destillation Rückstand leichte Destillate Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen, die man als erste Laufe aus der Vakuumdestillation von Ausflüssen aus der Behandlung eines durch Lösungsmittel deasphaltierten Vakuumrückstandes mit Wasserstoff in Gegenwart eines Katalysators erhält. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{1-10} bis C_{10} und siedet im Bereich von etwa 300 °C bis 400 °C. Ergibt ein Fertigöl mit einer Viskosität von 4cSt bei etwa 100 °C]
- EL** υδρογονάνθρακες, C_{1-10} , υπολειμματος ατμοσφαιρικής αποσταξης κατεργασμένου με υδρογόνο απασφιλτωμένου με οιαδήποτε γλαφρά προϊόντα αποσταξης Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται σαν τα πρώτα αποστάγματα απόσταξης σε κενό, απορροών από κατεργασία υπολειμματος μικρής περιοχής με υδρογόνο παρουσία κατ'αλήθεια. Συνίσταται κυρίως από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_1 έως και C_{10} και με περιοχή βρασμού από 300 °C έως 400 °C περίπου. Το έτοιμο έλαιο έχει ισχύως 4cSt στους 100 °C]
- EN** Hydrocarbons, C_{1-10} , hydrotreated solvent-deasphalted atm. distn. residue, distn. lights, Baseoil — unspecified
[A complex combination of hydrocarbons obtained as first runnings from the vacuum distillation of effluents from the treatment of a solvent deasphalted short residue with hydrogen in the presence of a catalyst. It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_{1-10} through C_{10} and boiling in the range of approximately 300 °C to 400 °C (572 °F to 752 °F). It produces a finished oil having a viscosity of 4cSt at approximately 100 °C (212 °F)]
- FR** hydrocarbures en C_{1-10} , résidu de distillation atmosphérique desasphalte au solvant et hydrotraité, fraction légère de distillation, Huile de base — non spécifique
[Combinaison complexe d'hydrocarbures obtenue comme premier écoulement lors de la distillation sous vide des effluents de traitement à l'hydrogène en présence d'un catalyseur, d'un résidu court desasphalte au solvant. Se compose principalement d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{1-10} et dont le point d'ébullition est compris approximativement entre 300 °C et 400 °C. donne une huile produit fini de viscosité égale à 4 cSt à environ 100 °C]
- IT** idrocarburi, C_{1-10} , residuo della distillazione atmosferica deasfaltato con solvente idrotrattato, frazioni leggere della distillazione, Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta come prime frazioni della distillazione sotto vuoto di effluenti dal trattamento di un residuo corto deasfaltato con solvente con idrogeno in presenza di un catalizzatore. È costituita prevalentemente da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{1-10} e punto di ebollizione nell'intervallo 300 °C-400 °C ca. Produce un olio finito avente viscosità di 4cSt a 100 °C]
- NL** koolwaterstoffen, C_{1-10} , waterstofbehandeld solvent gedeasfalteerd residu van de atmosferische destillatie, lichte destillatiefracties, Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen als de eerste fracties uit de vacuumdestillatie van de vloeistoffen die worden verkregen bij de behandeling van een solvent gedeasfalteerd kleverig residu met waterstof in aanwezigheid van een katalysator. Bestaat voornamelijk uit koolwaterstoffen, overwegend C_{1-10} , tot en met C_{10} , met een kooktraject van ongeveer 300 °C tot 400 °C. Het vormt een voltooide olie met een viscositeit van 4cSt bij ongeveer 100 °C]
- PT** hidrocarbonetos, C_{1-10} , residuo atmosférico desasfaltado com solvente tratado com hidrogenio, fracções leves da destilação, Óleo-base não especificado
[Uma combinação complexa de hidrocarbonetos obtida como a fracção inicial da destilação de vácuo de efluentes do tratamento de um residuo desasfaltado com solvente com hidrogenio na presença de um catalisador. É constituída predominantemente por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_{1-10} , até C_{10} e destila no intervalo de aproximadamente 300 °C a 400 °C. Produz um óleo acabado com uma viscosidade de 4cSt a cerca de 100 °C]

- ES hidrocarburos, C_{11-14} , fracción nattenica ligera extraída con disolvente, Aceite de base, sin especificar
[Combinación compleja de hidrocarburos obtenida por extracción de los aromáticos de un destilado nattenico ligero con una viscosidad de 9,5 cSt a 40 °C. Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_{11} a C_{14} , y con un intervalo de ebullición aproximado de 240 °C a 400 °C]
- DA carbonhydrider, C_{11-14} , solvent ekstraherede lette naphthenske, Uspecificeret baseolie
[En sammensat blanding af carbonhydrider opnået ved ekstraktion af aromaterne fra et let naphthendestillat med en viskositet på 9,5 cSt ved 40 °C. Den består overvejende af carbonhydrider overvejende fra C_{11} til og med C_{14} , med kogesinterval omtrent fra 240 °C til 400 °C]
- DE Kohlenwasserstoffe, C_{11-14} , durch Lösungsmittel extrahierte leichte naphthenhaltige, Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen, die man durch Extraktion der Aromaten aus einem leichten naphthenhaltigen Destillat mit einer Viskosität von 9,5 cSt bei 40 °C erhält. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{11} bis C_{14} , und siedet im Bereich von etwa 240 °C bis 400 °C]
- EL υδρογονάνθρακες, C_{11-14} , εκχυλίσμενοι με διαλύτη ελαφροί ναφθενικοί. Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολύπλοκος συνδυασμός υδρογονανθράκων που λαμβάνεται με εκχύλιση των αρωματικών από ελαφρό ναφθενικό απεσταγμά με ιξώδες 9,5 cSt σε 40 °C. Συνίσταται κυρίως από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{11} έως και C_{14} , και με περιοχή θρασμού από 240 °C έως 400 °C περίπου]
- EN Hydrocarbons, C_{11-14} , solvent extd light naphthenic, Baseoil — unspecified
[A complex combination of hydrocarbons obtained by extraction of the aromatics from a light naphthenic distillate having a viscosity of 9,5 cSt at 40 °C (104 °F). It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_{11} through C_{14} , and boiling in the range of approximately 240 °C to 400 °C (464 °F to 752 °F)]
- FR hydrocarbures en C_{11-14} , naphthéniques légers, extraction au solvant. Huile de base — non spécifique
[Combinaison complexe d'hydrocarbures obtenue par extraction des aromatiques dans un distillat naphthénique léger de viscosité égale à 9,5 cSt à 40 °C. Se compose principalement d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{11} à C_{14} et dont le point d'ébullition est compris approximativement entre 240 °C et 400 °C]
- IT idrocarburi, C_{11-14} , nattenici leggeri estratti con solvente. Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta per estrazione degli aromatici da un distillato nattenico leggero avente viscosità di 9,5 cSt a 40 °C. È costituita prevalentemente da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{11} a C_{14} , e punto di ebollizione nell'intervallo 240 °C-400 °C (ca)]
- NL koolwaterstoffen, C_{11-14} , solvent-geextraheerde lichte nattenische. Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen door extractie van de aromaten uit een licht nattenisch destillaat met een viscositeit van 9,5 cSt bij 40 °C. Bestaat voornamelijk uit koolwaterstoffen overwegend C_{11} tot en met C_{14} met een kooktraject van ongeveer 240 °C tot 400 °C]
- PT hidrocarbonetos, C_{11-14} , nattenicos leves extraídos com solvente. Óleo base não especificado
[Uma combinação complexa de hidrocarbonetos obtida por extração dos aromáticos de um destilado nattenico leve com uma viscosidade de 9,5 cSt a 40 °C. É constituída predominantemente por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_{11} até C_{14} e destila no intervalo de aproximadamente 240 °C a 400 °C]

ES: aceites lubricantes (petroleo), $C_{>25}$, extraídos con disolvente, desasfaltados, desparafinados, hidrogenados. Aceite de base, sin especificar
[Combinación compleja de hidrocarburos obtenida por extracción con disolvente e hidrogenación de residuos de destilación a vacío. Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte superior a C_{25} y produce un aceite final con una viscosidad del orden de 32cSt a 37cSt a 100 °C]

DA: smørelier (råolie), $C_{>25}$, solventekstraherede, afasfalterede, afvoksede, hydrogenerede. Uspecificeret baseolie
[En sammensat blanding af carbonhydnder opnået ved solventekstraktion og hydrogenering af vakuumdestillationsrester. Den består overvejende af carbonhydnder, overvejende større end C_{25} og danner en færdig olie med en viskositet i området 32cSt til 37cSt ved 100 °C]

DE: Schmieröle (Erdöl), $C_{>25}$, durch Lösungsmittel extrahiert, deasphaltiert, entwaxt, hydriert. Grundöl — nicht spezifiziert
[Komplexe Kombination von Kohlenwasserstoffen, die man durch Lösungsmittelextraktion und Hydrierung von Vakuumdestillationsrückständen erhält. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorwiegend größer als C_{25} und ergibt ein Fertigöl mit einer Viskosität im Bereich von 32 cSt bis 37 cSt bei 100 °C]

EL: λιπαντικά έλαια (πετρελαιο), $C_{>25}$, εκχυλισμένα με διαλυτή, απασφαλτωμένα, αποκηρωμένα, υδρογονωμένα. Βασικό ορυκτέλαιο — μη προδιαγεγραμμένο
[Πολύπλοκος συνδυασμός υδρογονανθράκων που λαμβάνεται από εκχύλιση με διαλυτή και υδρογόνωση υπολειμμάτων αποσταξης στο κενό. Συνίσταται κυρίως από υδρογονανθράκες με αριθμό ατόμων ανθράκα σημαντικά μεγαλύτερο από C_{25} και παράγει έτοιμο έλαιο που έχει ιξώδες της τάξης από 32cSt έως 37cSt στους 100 °C]

EN: Lubricating oils (petroleum), $C_{>25}$, solvent-extd, deasphalted, dewaxed, hydrogenated. Baseoil — unspecified
[A complex combination of hydrocarbons obtained by solvent extraction and hydrogenation of vacuum distillation residues. It consists predominantly of hydrocarbons having carbon numbers predominantly greater than C_{25} and produces a finished oil with a viscosity in the order of 32cSt to 37cSt at 100 °C (212 °F)]

FR: huiles lubrifiantes supérieures a C_{25} (petrole), extraction au solvant, desasphaltage, deparaffinage, hydrogenation. Huile de base — non spécifique
[Combinaison complexe d'hydrocarbures obtenue par extraction au solvant et hydrogenation de residus de distillation sous vide. Se compose principalement d'hydrocarbures dont le nombre de carbonos est en majorite superieur a C_{25} et donne une huile produit fini dont la viscosite est voisine de 32cSt a 37cSt a 100 °C]

IT: olii lubrificanti (petrolio), $C_{>25}$, estratti con solvente, deasfaltati, decerati, idrogenati. Olio base — non specificato
[Combinazione complessa di idrocarburi ottenuta per estrazione con solvente e idrogenazione di residui della distillazione sotto vuoto. È costituita prevalentemente da idrocarburi con numero di atomi di carbonio prevalentemente maggiore di C_{25} e produce un olio finito con viscosità dell'ordine di grandezza da 32cSt a 37cSt a 100 °C]

NL: smeerolien (aardolie), $C_{>25}$, solventgeextraheerd, gedeastalteerd, van was ontdaan, gehydrogeneerd. Basisolie — niet gespecificeerd
[Een complexe verzameling koolwaterstoffen die wordt verkregen door solventextractie en hydrogenering van vakuumdestillatieresiduen. Bestaat voornamelijk uit koolwaterstoffen overwegend groter dan C_{25} en vormt een voltooide olie met een viscositeit van 32cSt tot 37cSt bij 100 °C]

PT: oleos lubricantes (petroleo), $C_{>25}$, extraídos com solvente, desasfaltados, desparafinados, hidrogenados. Oleo-base não especificado
[Uma combinação complexa de hidrocarbonetos obtida por extração com solvente e hidrogenação de resíduos da destilação de vácuo. É constituída predominantemente por hidrocarbonetos com números de átomos de carbono predominantemente superiores a C_{25} e produz um óleo acabado com uma viscosidade da ordem dos 32cSt a 37cSt a 100 °C]

NOTA H

NOTA I

- ES** extractos (petróleo), disolvente del destilado nafténico pesado tratado con hidrógeno. Extracto aromático destilado (tratado)
[Combinación compleja de hidrocarburos obtenida por tratamiento con hidrógeno en presencia de un catalizador de un extracto del disolvente del destilado nafténico pesado. Compuesta fundamentalmente de hidrocarburos aromáticos con un número de carbonos en su mayor parte dentro del intervalo de C_{10} a C_{30} y produce un aceite final de al menos 19 cSt a 40 °C (100 SUS a 100 °F)]
- DA** ekstrakter (råolie), tungt naphthendestillat solvent - hydrogenbehandlede. Aromatisk ekstrakt af destillat (behandlet)
[En sammensat blanding af carbonhydrider opnået ved behandling af et tungt naphthendestillatsolventekstrakt med hydrogen i tilstedeværelse af en katalysator. Den består overvejende af aromatiske carbonhydrider, overvejende C_{10} til og med C_{30} , og danner en færdig olie på mindst 19 cSt ved 40 °C.]
- DE** Extrakte (Erdöl), schweres naphthenhaltiges Destillat Lösungsmittel, mit Wasserstoff behandelt. Aromatenextrakt aus Destillat (behandelt)
[Komplexe Kombination von Kohlenwasserstoffen, die man durch Behandeln eines schweren naphthenhaltigen destillierten Lösungsmittelextrakts mit Wasserstoff in Gegenwart eines Katalysators erhält. Besteht vorherrschend aus aromatischen Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{10} bis C_{30} , und ergibt ein Fertigöl von wenigstens 19 cSt bei 40 °C.]
- EL** εκχυλίσματα (πετρελαιο), βαρύνων ναφθενικού αποσταγματο, με διαλυτή υδρογονοκατεργασμένα. Επεξεργασμένο εκχυλίσμα
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται με κατεργασία βαρύνων ναφθενικού αποσταγματο, εκχυλίσματος με διαλυτή με υδρογόνο παρουσία καταλύτου. Αποτελείται κυρίως από αρωματικούς υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{10} έως και C_{30} και παράγει τελικό έλαιο με τουλάχιστον 19 cSt στους 40 °C.]
- EN** Extracts (petroleum), heavy naphthenic distillate solvent, hydrotreated. Distillate aromatic extract (treated)
[A complex combination of hydrocarbons obtained by treating a heavy naphthenic distillate solvent extract with hydrogen in the presence of a catalyst. It consists predominantly of aromatic hydrocarbons having carbon numbers predominantly in the range of C_{10} through C_{30} and produces a finished oil of at least 19 cSt at 40 °C (100 SUS at 100 °F).]
- FR** extraits au solvant (pétrole), distillat naphténique lourd, hydrotraités. Extrait aromatique de distillat (traité)
[Combinaison complexe d'hydrocarbures obtenue par traitement à l'hydrogène en présence d'un catalyseur d'un extrait au solvant de distillat naphténique lourd. Se compose principalement d'hydrocarbures aromatiques dont le nombre de carbones se situe en majorité dans la gamme C_{10} - C_{30} et donne une huile produit fini de viscosité supérieure ou égale à 19 cSt à 40 °C.]
- IT** estratti (petrolio), solvente distillato naftenico pesante, idrotrattato. Estratto aromatico distillato (trattato)
[Combinazione complessa di idrocarburi prodotta trattando un distillato naftenico pesante di un estratto con solventi con idrogeno in presenza di un catalizzatore. Costituita prevalentemente da idrocarburi aromatici con un numero di atomi di carbonio prevalentemente nell'intervallo C_{10} - C_{30} e produce un olio finito di almeno 19 cSt a 40 °C.]
- NL** extracten (aardolie), zwaar naftenhoudend destillaat - solvent - met waterstof behandeld. Aromatisch extract van destillaat (bewerkt)
[Een complexe verzameling koolwaterstoffen die wordt verkregen door de behandeling van een solventextract van zwaar naftenhoudend destillaat met waterstof in de aanwezigheid van een katalysator. Bestaat voornamelijk uit aromatische koolwaterstoffen, overwegend C_{10} tot en met C_{30} , vormt een voltooide olie met een viscositeit van ten minste 19 cSt bij 40 °C.]
- PT** extractos (petróleo), de solvente de destilados nafténicos pesados, tratados com hidrógeno. Extracto aromático de destilado (tratado)
[Uma combinação complexa de hidrocarbonetos obtida pelo tratamento de um extracto de solvente de um destilado nafténico pesado com hidrógeno na presença de um catalisador. É constituída predominantemente por hidrocarbonetos aromáticos com números de átomos de carbono predominantemente na gama de C_{10} até C_{30} e produz um óleo acabado com uma viscosidade mínima de 19 cSt a 40 °C.]

NOTA H

NOTA L

- ES Extractos (petróleo), disolvente del destilado nafténico ligero, hidrodesulfurado ; Extracto aromático destilado (tratado)
[Combinación compleja de hidrocarburos obtenida por tratamiento del extracto, obtenido de un proceso de extracción con disolvente con hidrógeno en presencia de un catalizador en condiciones adecuadas para separar compuestos de azufre. Compuesta fundamentalmente de hidrocarburos aromáticos con un número de carbonos en su mayor parte dentro del intervalo de C_{11} a C_{16} . Esta corriente es probable que contenga 5 % en peso o más de hidrocarburos aromáticos con anillos condensados de 4 a 6 miembros.]
- DA ekstrakter (råolie), let naphthendestillat solvent-, hydroafsvovlede ; Aromatisk ekstrakt af destillat (behandlet)
[En sammensat blanding af carbonhydrider opnået ved at behandle ekstraktet, opnået fra en solventekstraktionsproces, med hydrogen i tilstedeværelse af en katalysator under betingelser primært til fjernelse af svovlforbindelser. Den består overvejende af aromatiske carbonhydrider, overvejende C_{11} til og med C_{16} . Denne strøm indeholder sandsynligvis 5 vægtprocent, eller mere, aromatiske carbonhydrider bestående af 4- til 6-leddede kondenserede ringe.]
- DE Extrakte (Erdöl), leichtes naphthenhaltiges Destillat Lösungsmittel, hydrodesulfuriert ; Aromatenextrakt aus Destillat (behandelt)
[Komplexe Kombination von Kohlenwasserstoffen, die man durch Behandeln eines Extraktes aus einem Lösungsmittel-extraktions-Verfahren mit Wasserstoff in Gegenwart eines Katalysators unter Bedingungen in erster Linie zur Beseitigung von Schwefelverbindungen erhält. Besteht vorherrschend aus aromatischen Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{11} bis C_{16} . Dieser Lauf kann 5 Gewichtsprozent oder mehr aromatische Kohlenwasserstoffe mit 4- bis 6-gliedrigen kondensierten Ringen enthalten.]
- EL εκχυλίσματα (πετρελαιο), ελαφρό ναφθενικό αλδόσταγμα εκχυλίσμενο με διαλύτη, υδρογονοαποθειωμένο· Επεξεργασμένο εκχύλισμα
[Πολυπλοκός συνδυασμός υδρογονάνθρακων που λαμβάνεται από κατεργασία εκχυλίσματος που λαμβάνεται από εκχύλιση με διαλύτη, με υδρογόνο παρουσία καταλύτη και σε συνθήκες πρωτίστως τέτοιες ώστε να απομακρυνθούν ενώσεις θείου. Συνίσταται κυρίως από υδρογονάνθρακες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{11} έως και C_{16} . Το ρεύμα αυτό πιθανόν να περιέχει 5 % κατά βάρος, ή περισσότερο αρωματικούς υδρογονάνθρακες με τετραμελείς έως εξαμελείς συμπυκνωμένους δακτυλίους.]
- EN extracts (petroleum), light naphthenic distillate solvent, hydrodesulfurized ; Distillate aromatic extract (treated)
A complex combination of hydrocarbons obtained by treating the extract, obtained from a solvent extraction process, with hydrogen in the presence of a catalyst under conditions primarily to remove sulfur compounds. It consists predominantly of aromatic hydrocarbons having carbon numbers predominantly in the range of C_{11} through C_{16} . This stream is likely to contain 5 wt % or more of 4- to 6-membered condensed ring aromatic hydrocarbons.]
- FR extraits au solvant (pétrole), distillat naphénique léger, hydrodésulfurés ; Extrait aromatique de distillat (traité)
[Combinaison complexe d'hydrocarbures obtenue par traitement de l'extrait résultant d'une extraction au solvant avec de l'hydrogène en présence d'un catalyseur, dans des conditions destinées en premier lieu à l'élimination des composés soufrés. Se compose principalement d'hydrocarbures aromatiques dont le nombre de carbones se situe en majorité dans la gamme C_{11} - C_{16} . Peut contenir 5 % ou plus, en poids, d'hydrocarbures aromatiques à noyaux condensés comportant 4 à 6 cycles.]
- IT estratti (petrolio), solvente di distillato nafténico leggero, idrodesolforato ; Estratto aromatico distillato (trattato)
[Combinazione complessa di idrocarburi ottenuta dal trattamento dell'estratto, ottenuto da un processo di estrazione con solvente, con idrogeno in presenza di un catalizzatore in condizioni atte prevalentemente a rimuovere i composti solforati. È costituita prevalentemente da idrocarburi aromatici con numero di atomi di carbonio prevalentemente nell'intervallo C_{11} - C_{16} . Questa corrente contiene probabilmente più del 5 % in peso di idrocarburi aromatici condensati da 4 a 6 elementi.]
- NL extracten (aardolie), naftenhoudend licht destillaat solvent-, waterstofontzwaveld ; Aromatisch extract van destillaat (verwerkt)
[Een complexe combinatie van koolwaterstoffen die wordt verkregen door behandeling van het ruw met een solventextractieproces verkregen extract met waterstof in de aanwezigheid van een katalysator onder omstandigheden die primair gericht zijn op de verwijdering van zwavelverbindingen. Het bestaat voornamelijk uit aromatische koolwaterstoffen, overwegend uit tot en met C_{16} . Deze stroom kan waarschijnlijk 5 of meer gewichtsprocent aromatische koolwaterstoffen met 4- tot 6-voudig gecondenseerde ringen.]
- PT extractos (petróleo), solvente de destilados nafténicos leves, hidrogenodessulfurados ; Extracto aromático de destilado (tratado)
[Uma combinação complexa de hidrocarbonetos, obtida por tratamento de um extracto, obtido por um processo de extracção com solvente com hidrogénio na presença de um catalisador para remover principalmente compostos de enxofre. É constituída predominantemente por hidrocarbonetos aromáticos com números de átomos de carbono predominantemente na gama de C_{11} até C_{16} . Esta corrente provavelmente contém 5 % em peso ou mais de hidrocarbonetos aromáticos policíclicos com 4 a 6 membros.]

NOTA H

NOTA I

- ES** extractos (petroleo), disolvente del destilado parafinico ligero, tratado con acido. Extracto aromático destilado (tratado)
[Combinación compleja de hidrocarburos obtenida como una fracción de la destilación de un extracto de la extracción con disolvente de destilado de cabeza parafinico ligero de petroleo que se somete a un refinado con acido sulfúrico. Compuesta fundamentalmente de hidrocarburos aromaticos con un numero de carbonos en su mayor parte dentro del intervalo de C_{10} a C_{14}]
- DA** ekstrakter (råolie), let paraffindestillat solvent, syrebehandlede. Aromatisk ekstrakt af destillat (behandlet)
[En sammensat blanding af carbonhydrider opnået som en fraktion fra destillationen af et ekstrakt a solventekstraktionerne af lette paraffintopfraktion råoliedestillater, der er underkastet en svovlsyrefrafining. Den består overvejende af aromatiske carbonhydrider, overvejende C_{10} til og med C_{14}]
- DE** Extrakte (Erdöl), leichtes paraffinhaltiges Destillat Lösungsmittel. Säure behandelt. Aromatenextrakt aus Destillat (behandelt)
[Komplexe Kombination von Kohlenwasserstoffen, die man als Fraktion der Destillation eines Extraktes aus der Lösungsmittelextraktion von leichten paraffinhaltigen Kopf-Erdöldestillaten erhält, die einer schwefelsauren Aufbereitung ausgesetzt werden. Besteht vorherrschend aus aromatischen Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{10} bis C_{14}]
- EL** εκχυλίσματα (πετρέλαιου), ελαφρο παραφινικό απόσταγμα εκχυλίσμενο με διαλυτή. Κατεργασμένο με οξύ. Έπεξεργασμένο εκχύλισμα
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται σαν κλάσμα της απόσταξης εκχυλίσματος από την εκχύλιση με διαλυτή ελαφρών παραφινικών αποσταγμάτων πετρελαιοειδούς κορυφής, που υποβάλλεται σε εξουθενωτικό με θειικό οξύ. Συνίσταται κυρίως από αρωματικούς υδρογονανθράκες με αριθμό ατόμων ανθράκα κυρίως στην περιοχή από C_{10} έως και C_{14}]
- EN** Extracts (petroleum), light paraffinic distillate solvent, acid treated. Distillate aromatic extract (treated)
[A complex combination of hydrocarbons obtained as a fraction of the distillation of an extract from the solvent extraction of light paraffinic top petroleum distillates that is subjected to a sulfuric acid refining. It consists predominantly of aromatic hydrocarbons having carbon numbers predominantly in the range of C_{10} through C_{14}]
- FR** extraits au solvant (pétrole), distillat paraffinique léger, traités à l'acide. Extrait aromatique de distillat (traité)
[Combinaison complexe d'hydrocarbures obtenue comme fraction de la distillation de l'extrait résultant d'une extraction au solvant de distillats paraffiniques légers pétroliers et ayant subi un raffinage à l'acide sulfurique. Se compose principalement d'hydrocarbures aromatiques dont le nombre de carbones se situe en majorité dans la gamme C_{10} à C_{14}]
- IT** estratti (petrolio), solvente distillato paraffinico leggero, trattati con acido. Estratto aromatico distillato (trattato)
[Combinazione complessa di idrocarburi ottenuta come frazione della distillazione di un estratto dall'estrazione con solvente di distillati paraffinici leggeri di petrolio di testa e che viene sottoposta a raffinazione con acido solforico. E' costituita da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{10} a C_{14}]
- NL** extracten (aardolie), paraffinehoudend licht destillaat solvent, zuurbehandeld. Aromatisch extract van destillaat (bewerkt)
[Een complexe verzameling koolwaterstoffen die wordt verkregen als een fractie uit de destillatie van een extract uit de solventextractie van lichte paraffinehoudende topdestillaten uit aardolie dat is onderworpen aan een zuivering met zwavelzuur. Bestaat voornamelijk uit aromatische koolwaterstoffen, overwegend C_{10} tot en met C_{14}]
- PT** extractos (petroleo), de solvente de destilados parafínicos leves, tratados com acido. Extracto aromático de destilado (tratado)
[Uma combinação complexa de hidrocarbonetos obtida como a fracção da destilação de um extracto da extracção com solvente de destilados parafínicos leves que é submetida a um processo de refinação com ácido sulfúrico. É constituída predominantemente por hidrocarbonetos aromáticos com números de átomos de carbono predominantemente na gama de C_{10} até C_{14}]

NOTA H

NOTA L

- ES : Extractos (petróleo), disolvente del destilado parafínico ligero, hidrodesulfurado ; Extracto aromático destilado (tratado)
[Combinación compleja de hidrocarburos obtenida por extracción con disolventes de un destilado parafínico ligero y tratado con hidrógeno para transformar el azufre orgánico en sulfuro de hidrógeno que se elimina. Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_{11} a C_{20} , y produce un aceite final con una viscosidad superior a 10cSt a 40 °C.]
- DA : ekstrakter (råolie), let paraffindestillat solvent-, hydroafsvovlede ; Aromatisk ekstrakt af destillat (behandlet)
[En sammensat blanding af carbonhydrider opnået ved solventekstraktion af et let paraffindestillat og behandlet med hydrogen for at omdanne organisk svovl til hydrogensulfid, det fjernes. Den består overvejende af carbonhydrider, overvejende C_{11} til og med C_{20} , og danner en færdig olie med viskositet på mere end 10cSt ved 40 °C.]
- DE : Extrakte (Erdöl), leichtes paraffinhaltiges Destillat Lösungsmittel, hydrodesulfuriert ; Aromatenextrakt aus Destillat (behandelt)
[Komplexe Kombination von Kohlenwasserstoffen, erhalten durch Lösungsmittelextraktion eines leichten paraffinhaltigen Destillates und Behandeln mit Wasserstoff zur Konvertierung von organischem Schwefel in Schwefelwasserstoff, der eliminiert wird. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{11} bis C_{20} und ergibt ein fertiges Öl mit einer Viskosität größer als 10 cSt bei 40 °C.]
- EL : εκχυλίσματα (πετρελαίου), ελαφρό παραφινικό απόσταγμα εκχυλισμένο με διαλύτη, υδρογονοαποθειωμένο· Επεξεργασμένο εκχυλίσμα
[Πολύπλοκος συνδυασμός υδρογονανθράκων που λαμβάνεται με εκχύλιση με διαλύτη ελαφρού παραφινικού αποσταγμάτος και κατεργάζεται με υδρογόνο για να μετατραπεί το οργανικό θείο σε υδρόθειο που απομακρύνεται. Συνίσταται κυρίως από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{11} έως και C_{20} , και παράγει τελικό έλαιο με ιξώδες μεγαλύτερο από 10cSt στους 40 °C.]
- EN : Extracts (petroleum), light paraffinic distillate solvent, hydrodesulfurized ; Distillate aromatic extract (treated)
[A complex combination of hydrocarbons obtained by solvent extraction of a light paraffin distillate and treated with hydrogen to convert the organic sulfur to hydrogen sulfide which is eliminated. It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_{11} through C_{20} and produces a finished oil with a viscosity of greater than 10cSt at 40 °C.]
- FR : extraits au solvant (pétrole), distillat paraffinique léger, hydrodésulfurés ; Extrait aromatique de distillat (traité)
[Combinaison complexe d'hydrocarbures obtenue par extraction au solvant d'un distillat paraffinique léger et traitée à l'hydrogène afin de convertir le soufre organique en hydrogène sulfure, qui est ensuite éliminé. Se compose principalement d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{11} - C_{20} , et donne une huile-produit fini de viscosité supérieure à 10cSt à 40 °C.]
- IT : estratti (petrolio), solvente distillato paraffinico leggero, idrodesolforati ; Estratto aromatico distillato (trattato)
[Combinazione complessa di idrocarburi ottenuta mediante estrazione con solvente di un distillato paraffinico leggero e trattato con idrogeno per trasformare lo zolfo organico in idrogeno solforato che viene eliminato. È costituita da idrocarburi con numero di atomi di carbonio prevalentemente nell'intervallo C_{11} - C_{20} e produce un olio finito con viscosità maggiore di 10cSt a 40 °C.]
- NL : extracten (aardolie), paraffinehoudend licht destillaat solvent-, waterstofontzwaveld ; Aromatisch extract van destillaat (bewerkt)
[Een complexe verzameling koolwaterstoffen die wordt verkregen door solventextractie van een paraffinehoudend licht destillaat en wordt behandeld met waterstof om organische zwavel om te zetten in waterstofsulfide dat wordt verwijderd. Bestaat voornamelijk uit koolwaterstoffen, overwegend C_{11} tot en met C_{20} en vormt een voltooide olie met een viscositeit van ongeveer 10cSt bij 40 °C.]
- PT : extractos (petróleo), de solvente de destilados parafínicos leves, hidrogenodessulfurizados .
[Uma combinação complexa de hidrocarbonetos obtida por extração com solvente de um destilado parafínico leve e tratada com hidrogénio para converter o enxofre orgânico em sulfureto de hidrogénio que é eliminado. É constituída predominantemente por hidrocarbonetos com números de átomos de carbonos predominantemente na gama de C_{11} até C_{20} e produz um óleo acabado com uma viscosidade superior a 10cSt a 40 °C.]

NOTA H

NOTA L

- ES extractos (petroleo), disolvente del destilado parafinico pesado, tratado con arcilla , Extracto aromatico destilado (tratado)
[Combinacion compleja de hidrocarburos que resulta del tratamiento de una fraccion de petroleo con arcilla natural o modificada en un proceso por contacto o percolacion para separar las trazas presentes de compuestos polares e impurezas. Compuesta fundamentalmente de hidrocarburos aromaticos con un numero de carbonos en su mayor parte dentro del intervalo de C_{20} a C_{40} . Esta corriente es probable que contenga un 5 % en peso o mas de hidrocarburos aromaticos con anillos de 4-6 miembros]
- DA ekstrakter (råolie), tungt paraffindestillat solvent , lerbehandlede , Aromatisk ekstrakt af destillat (behandlet)
[En sammensat blanding af carbonhydrier opnået fra behandling af en råoliefraktion med naturligt eller modificeret ler i enten en kontakt- eller perkolationsproces for at fjerne spurmængderne af polære forbindelser eller tilstedeværende urenheder. Den består overvejende af aromatiske carbonhydrier, overvejende C_{20} til og med C_{40} . Denne strøm indeholder sandsynligvis 5 vægtprocent, eller mere aromatiske carbonhydrier bestående af 4- til 6-leddede kondenserede ringe]
- DE Extrakte (Erdöl), schwere paraffinhaltige Destillat Lösungsmittel, Ton-behandelt , Aromatenextrakt aus Destillat (behandelt)
[Komplexe Kombination von Kohlenwasserstoffen die man durch Behandeln einer Erdöl Fraktion mit natürlichem oder modifiziertem Ton entweder in einem Kontakt- oder Perkolationsverfahren zur Beseitigung von Spuren polarer Verbindungen und von Verunreinigungen erhält. Besteht vorherrschend aus aromatischen Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{20} bis C_{40} . Dieser Lauf kann 5 Gewichtsprozent oder mehr aromatische Kohlenwasserstoffe mit 4- bis 6-gliedrigen kondensierten Ringen enthalten]
- EL εκχυλίσματα (πετρελαιο), βαρύ παραφινικό αποστάγμα εκχυλισμένο με διαλυτή, κατεργασμένο με αργίλλο
Επεξεργασμένο εκχυλίσμα
[Πολύπλοκος συνδυασμός υδρογονανθράκων που προκύπτει από κατεργασία κλάσματος πετρελαίου με φυσική ή τροποποιημένη αργίλλο είτε με διεργασία επαφής είτε διήθησης, για να απομακρυνθούν ίχνηποσοτήτες πολικών ενώσεων και υπάρχουσες προσμίξεις. Συνίσταται κυρίως από αρωματικούς υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{20} έως και C_{40} . Αυτό το ρεύμα μπορεί να περιέχει 5 % κατά βάρος ή περισσότερο αρωματικούς υδρογονανθράκες με τετραμελείς έως εξαμελείς δακτυλίους]
- EN Extracts (petroleum), heavy paraffinic distillate solvent, clay-treated , Distillate aromatic extract (treated)
[A complex combination of hydrocarbons resulting from treatment of a petroleum fraction with natural or modified clay in either a contact or percolation process to remove the trace amounts of polar compounds and impurities present. It consists predominantly of aromatic hydrocarbons having carbon numbers predominantly in the range of C_{20} through C_{40} . This stream is likely to contain 5 wt % or more 4-6 membered ring aromatic hydrocarbons]
- FR extraits au solvant (pétrole), distillat paraffinique lourd, traités à la terre , Extrait aromatique de distillat (traité)
[Combinaison complexe d'hydrocarbures résultant du traitement d'une fraction pétrolière avec de l'argile naturelle ou modifiée, par contact ou percolation, destinée à éliminer les traces de composés polaires et les impuretés. Se compose principalement d'hydrocarbures aromatiques dont le nombre de carbones se situe en majorité dans la gamme C_{20} - C_{40} . Peut contenir 5 % ou plus, en poids, d'hydrocarbures aromatiques à noyaux condensés comportant de 4 à 6 cycles]
- IT estratti (petrolio), distillato solvente paraffinico pesante, trattati con argilla , Estratto aromatico distillato (trattato)
[Combinazione complessa di idrocarburi risultante dal trattamento di una frazione di petrolio con argilla naturale o modificata in un processo sia di contatto che di percolazione per eliminare le quantità in traccia di composti polari ed impurezze presenti. È costituita prevalentemente da idrocarburi aromatici con un numero di atomi di carbonio prevalentemente nell'intervallo C_{20} - C_{40} . Questa corrente contiene probabilmente il 5 % o più di idrocarburi aromatici con un numero di anelli da 4 a 6]
- NL ekstrakter (raoïolie), zwaar paraffinehoudend destillat solvent , met klei behandeld , Aromatisch extract van destillat (bewerkt)
[Een complexe combinatie van oplosmiddelen die wordt verkregen uit de behandeling van een aardoliefractie met een natuurlijke of gemodificeerde klei in een contact- of een filtratie proces waarbij sporen van polaire verbindingen en aanwezige onzuiverheden worden verwijderd. Bestaat voornamelijk uit aromatische koolwaterstoffen, overwegend C_{20} tot en met C_{40} . Deze stroom bevat waarschijnlijk 5 of meer gewichtsprocenten aromatische koolwaterstoffen met 4- tot 6-voudig gecondenseerde ringen]
- PT extractos (petróleo), de solvente de destilados parafínicos pesados, tratados com argila , Extracto aromático de destilado (tratado)
[Uma combinação complexa de hidrocarbonetos resultante do tratamento de uma fracção petrolífera com argila natural ou modificada quer por mistura quer por um processo de percolação para remoção de vestígios de compostos polares e impurezas presentes. É constituída predominantemente por hidrocarbonetos aromáticos com números de átomos de carbono predominantemente na gama C_{20} até C_{40} . Este produto geralmente contém 5 % em peso ou mais de hidrocarbonetos aromáticos com 4 a 6

Compuesta fundamentalmente de hidrocarburos con un número de carbonos en su mayor parte dentro del intervalo de C_{11} a C_{40} y produce un aceite final con una viscosidad superior a 19cSt a 40 °C]
- DA ekstrakter (råolie), solventarvoksende tunge paraffindestillat solvent-, hydroafsvovlede ; Aromatisk ekstrakt af destillat (behandlet)
[En sammensat blanding af carbonhydrider opnået fra et solventafvokset råolieråstof ved behandling med hydrogen for at omdanne organisk svovl til hydrogensulfid, der jernes. Den består overvejende af carbonhydrider, overvejende C_{11} til og med C_{40} , og danner en færdig olie med en viskositet større en 19cSt ved 40 °C]
- DE Extrakte (Erdöl), durch Lösungsmittel entwachste schwere paraffinhaltige Destillat Lösungsmittel, hydrodesulfuriert ; Aromatenextrakt aus Destillat (behandelt)
[Komplexe Kombination von Kohlenwasserstoffen, die man aus einem durch Lösungsmittel entwachsenen Erdölausgangsstoff durch Behandeln mit Wasserstoff zur Konvertierung von organischem Schwefel in Schwefelwasserstoff, der entfernt wird, erhält. Besteht vorherrschend aus Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{11} bis C_{40} und ergibt ein Fertigöl mit einer Viskosität größer als 19 cSt bei 40 °C]
- EL εκχυλίσματα (πετρελαίου), από αποκηρωμένο με διαλύτη βαρύ παραφινικό κλάσμα καθαρισμένο με διαλύτη, υδρογονοαποδειωμένο· Επεξεργασμένο εκχύλισμα
[Πολυπλοκός συνδυασμός υδρογονανθράκων που λαμβάνεται με πετρελαιοκή πρώτη ύλη αποκηρωμένη με διαλύτη από κατεργασία με υδρογόνο για να μετατραπεί το οργανικό θείο σε υδρόθειο που απομακρύνεται. Συνίσταται κυρίως από υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{11} έως και C_{40} και παράγει τελικό έλαιο με ιξώδες μεγαλύτερο από 19cSt στους 40 °C]
- EN Extracts (petroleum), solvent-dewaxed heavy paraffinic distillate solvent, hydrodesulfurized ; Distillate aromatic extract (treated)
[A complex combination of hydrocarbons obtained from a solvent dewaxed petroleum stock by treating with hydrogen to convert organic sulfur to hydrogen sulfide which is removed. It consists predominantly of hydrocarbons having carbon numbers predominantly in the range of C_{11} through C_{40} and produces a finished oil with a viscosity of greater than 19cSt at 40 °C.]
- FR extraits au solvant hydrodesulfures (pétrole), distillat paraffinique lourd déparaffiné au solvant ; Extrait aromatique de distillat (traité)
[Combinaison complexe d'hydrocarbures obtenue par traitement à l'hydrogène d'une charge pétrolière déparaffinée au solvant, afin de convertir le soufre organique en hydrogène sulfure, qui est ensuite éliminé. Se compose principalement d'hydrocarbures dont le nombre de carbones se situe en majorité dans la gamme C_{11} - C_{40} , et donne une huile-produit fini de viscosité supérieure à 19cSt à 40 °C]
- IT estratti (petrolio), solvente distillato paraffinico pesante decerato con solvente, idrodesolforato ; Estratto aromatico distillato (trattato)
[Combinazione complessa di idrocarburi ottenuta da uno stock di petrolio decerato con solvente per trattamento con idrogeno per trasformare lo zolfo organico in idrogeno solforato che viene eliminato. È costituita prevalentemente da idrocarburi con numeri di atomi di carbonio prevalentemente nell'intervallo C_{11} - C_{40} e produce un olio finito con viscosità superiore a 19cSt a 40 °C.]
- NL extracten (aardolie), met solvent van was ontdane zwaar paraffinehoudend destillaat solvent-, waterstofontzwaveld ; Aromatisch extract van destillaat (bewerkt)
[Een complexe verzameling koolwaterstoffen die wordt verkregen uit een met solvent van was ontdane aardoliegrondstof door behandeling met waterstof om organische zwavel om te zetten in waterstofsulfide dat wordt verwijderd. Bestaat voornamelijk uit koolwaterstoffen, overwegend C_{11} tot en met C_{40} en vormt een voltooide olie met een viscositeit groter dan 19cSt bij 40 °C.]
- PT extractos (petróleo), de solvente de destilados parafínicos pesados desparafinados com solvente, hidrogenodessulfurizados ; Extracto aromático de destilado (tratado)
[Uma combinação complexa de hidrocarbonetos obtida de uma fracção petrolífera desparafinada com solvente por tratamento com hidrogénio para conversão de enxofre orgânico em sulfureto de hidrogénio que é removido. É constituída predominantemente por hidrocarbonetos com números de átomos de carbono predominantemente na gama de C_{11} até C_{40} e produz um óleo acabado com uma viscosidade superior a 19cSt a 40 °C]

NOTA H

NOTA I

- ES extractos (petroleo) destilado parafinico ligero extraido con disolvente, tratado con carbon , Extracto aromatico destilado (tratado)
[Combinacion compleja de hidrocarburos obtenida como una fraccion de la destilacion de un extracto recuperado por extraccion con disolvente del destilado de cabeza parafinico ligero de petroleo tratado con carbon vegetal activado para separar constituyentes polares en trazas e impurezas. Compuesta fundamentalmente de hidrocarburos aromaticos con un numero de carbonos en su mayor parte dentro del intervalo de C_{10} a C_{12}]
- DA ekstrakter (råolie), let paraffindestillat solvent , carbonbehandiede Aromatisk ekstrakt af destillat (behandlet)
[En sammensæt blanding af carbonhydroider opnået som en fraktion fra destillation af et ekstrakt, genvundet ved solventekstraktion af let paraffin topaoliedestillat behandlet med aktivt kul for at fjerne spor af polære bestanddele og urenheder. Den består overvejende af aromatiske carbonhydroider overvejende C_{10} til og med C_{12}]
- DE Extrakte (Erdöl), leichte paraffinhaltige Destillat Lösungsmittel mit Kohlenstoff behandelt , Aromatenextrakt aus Destillat (behandelt)
[Komplexe Kombination von Kohlenwasserstoffen die man als eine Fraktion aus der Destillation eines Extraktes erhält, den man durch Lösungsmittelextraktion von leichtem paraffinhaltigen Kopf Erdöldestillat wiedergewinnt, mit Aktivkohle behandelt um Spuren polarer Bestandteile und Verunreinigungen zu entfernen. Besteht vorherrschend aus aromatischen Kohlenwasserstoffen mit Kohlenstoffzahlen vorherrschend im Bereich von C_{10} bis C_{12}]
- EL εκχυλίσματα (πετρελαιο) από ελαφρό παραφινικό αποστάγμα εκχυλισμένο με διαλυτή, κατεργασμένο με άνθρακα. Επεξεργασμένο εκχυλίσμα
[Πολύπλοκος συνδυασμός υδρογονανθράκων που λαμβάνεται σαν κλάσμα από αποστάξη εκχυλίσματος που ανακτάται από εκχύλιση με διαλυτή ελαφρού παραφινικού αποσταγματος κορυφής πετρελαιο κατεργασμένου με ενεργό άνθρακα για να απομακρυνθούν ίχνη πολικών συστατικών και προσμείξεις. Συνίσταται κυρίως από αρωματικούς υδρογονανθράκες με αριθμό ατόμων άνθρακα κυρίως στην περιοχή από C_{10} έως και C_{12}]
- EN Extracts (petroleum), light paraffinic distillate solvent carbon-treated Distillate aromatic extract (treated)
[A complex combination of hydrocarbons obtained as a fraction from distillation of an extract recovered by solvent extraction of light paraffinic top petroleum distillate treated with activated charcoal to remove traces of polar constituents and impurities. It consists predominantly of aromatic hydrocarbons having carbon numbers predominantly in the range of C_{10} through C_{12}]
- FR extraits au solvant de distillat paraffinique léger (petrole), traites au charbon Extrait aromatique de distillat (traite)
[Combinaison complexe d'hydrocarbures obtenue comme fraction dans la distillation d'un extrait recupere par extraction au solvant de distillat de tete paraffinique léger et traite au charbon actif afin d'éliminer les traces de constituants polaires et les impuretes. Se compose principalement d'hydrocarbures aromatiques dont le nombre de carbones se situe en majorite dans la gamme C_{10} a C_{12}]
- IT estratti (petrolio), distillato paraffinico leggero solvente, trattato con carbone , Estratto aromatico distillato (trattato)
[Combinazione complessa di idrocarburi ottenuta come frazione della distillazione di un estratto recuperato per estrazione con solvente di distillato di testa paraffinico leggero di petrolio trattato con carbone attivo per eliminare costituenti polari in tracce ed impurezze. E' costituita prevalentemente da idrocarburi aromatici con numero di atomi di carbonio prevalentemente nell'intervallo C_{10} - C_{12}]
- NI extracten (aardolie) licht paraffinehoudend destillaat solvent met koolstof behandeld , Aromatisch extract van destillaat (bewerkt)
[Een complexe verzameling koolwaterstoffen die wordt verkregen als een fractie uit de destillatie van een extract dat is herwonnen door solventextractie van het lichte paraffinehoudende bij aftoppen verkregen aardoliedestillaat, behandeld met geactiveerde kool teneinde sporen van polaire bestanddelen en onzuiverheden te verwijderen. Bevat voornamelijk aromatische koolwaterstoffen overwegend C_{10} tot en met C_{12}]
- PT extractos (petroleo) de solvente de destilados parafinicos leves, tratados com carvão activado , Extracto aromatico de destilado (tratado)
[Uma combinação complexa de hidrocarbonetos obtida como uma fracção de destilação de um extracto recuperado por extracção com solvente de um destilado parafínico leve tratado com carvão activado para remoção de vestígios de constituintes polares e impurezas. É constituída predominantemente por hidrocarbonetos aromaticos com numeros de atomos de carbono predominante mente na gama de C_{10} ate C_{12}]

Distillati (catrame di carbone), oli naftalenici, estratti acidi; Olio di metilnaftalene lavato	648-094-00-8
Distillati (catrame di carbone), oli pesanti; Olio di antracene II (pesante)	648-044-00-5
Distillati (catrame da carbone), di testa, ricchi di fluorene: olio lavaggio gas ridistillato	648-042-00-4
Distillati (catrame di carbone), oli pesanti, frazione pirene: Ridistillati di olio di antracene II (pesante)	648-050-00-8
Distillati (catrame da carbone), di testa, esenti da fluorene: Olio lavaggio gas ridistillato	648-078-00-0
Distillati (petrolio), olio di pirolisi della produzione di alcheni-alchini, miscelato con carbone di catrame ad alta temperatura, frazione indene; Ridistillati	648-036-00-1
Distillati (petrolio), frazioni pesanti di cracking catalitico; Olio combustibile denso	649-010-00-2
Distillati (petrolio), frazioni pesanti di cracking termico; Olio combustibile denso	649-014-00-4
Distillati (petrolio), intermedi idrodesolforati crackizzati cataliticamente; Olio combustibile denso	649-021-00-2
Distillati (petrolio), idrodesolforati pesanti crackizzati cataliticamente; Olio combustibile denso	649-022-00-8

Nome	Numero indice
Distillati (petrolio), sotto vuoto, residui di petrolio; Olio combustibile denso	649-034-00-3
Distillati (petrolio), tagli leggeri sotto vuoto; Olio combustibile denso	649-036-00-4
Distillati (petrolio), sotto vuoto; Olio combustibile denso	649-038-00-5
Distillati (petrolio), intermedi da cracking catalitico, degradati termicamente; Olio combustibile denso	649-044-00-8
Distillati (petrolio), frazioni intermedie di idrotrattamento, punto di ebollizione intermedio; Nafta di "hydrotreating" con basso punto di ebollizione	649-331-00-8
Distillati (petrolio), idrodesolforati taglio intero intermedi; Olio combustibile denso	649-047-00-4
Distillati (petrolio), bassobollenti, processo di idrotrattamento di distillati leggeri; Nafta di "hydrotreating" con basso punto di ebollizione	649-332-00-3
Distillati (petrolio), frazioni paraffiniche pesanti; Olio base non raffinato o mediamente raffinato	649-051-00-6
Distillati (petrolio), intermedi altamente raffinati; Gasolio - non specificato	649-231-00-4
Distillati (petrolio), C3-6, ricchi di piperilene; Gas di petrolio	649-205-00-2
Distillati (petrolio), nafta pesante di idrotrattamento, frazioni di testa del deisoesanizzatore; Nafta di "hydrotreating" con basso punto di ebollizione	649-333-00-9
Distillati (petrolio), frazioni intermedie addolcite; Gasolio - non specificato	649-212-00-0
Distillati (petrolio), paraffinici intermedi, trattati con carbone; Gasolio - non specificato.	649-240-00-3
Distillati (petrolio), frazione intermedia raffinata con solvente; Gasolio - non specificato	649-214-00-1
Distillati (petrolio), C3-5, ricchi di 2-metil-2-butene; Nafta con basso punto di ebollizione-non specificata	649-358-00-5
Distillati (petrolio), frazione intermedia trattata con acido; Gasolio - non specificato	649-216-00-2
Distillati (petrolio), leggeri di prima distillazione; Nafta con basso punto di ebollizione	649-268-00-6
Distillati (petrolio), frazione leggera trattata con acido; Gasolio non specificato	649-217-00-8
Distillati (petrolio), distillati di petrolio crackizzati con vapore d'acqua polimerizzati, frazione C5-12; Nafta con basso punto di ebollizione-non specificati	649-359-00-0
Distillati (petrolio), frazione paraffinica pesante trattata con acido; Olio base non raffinato o mediamente raffinato	649-056-00-3
Distillati (petrolio), derivati da cracking con vapore di nafta, aromatici leggeri da idrotrattamento; Nafta di cracking catalitico con basso punto di ebollizione	649-293-00-2
Distillati (petrolio), frazione neftenica pesante neutralizzata chimicamente; Olio base non raffinato o mediamente raffinato	649-060-00-5

Nome	Numero indice
Distillati (petrolio), crackizzati a vapore, frazioni C5-12; Nafta con basso punto di ebollizione-non specificata	649-360-00-6
Distillati (petrolio), frazione intermedia neutralizzata chimicamente; Gasolio - non specificato	649-219-00-9
Distillati (petrolio), frazioni di testa di nafta di prima distillazione sottoposta a reforming catalitico; Nafta di reforming catalitico con basso punto di ebollizione	649-305-00-6
Distillati (petrolio), frazione intermedia di 'hydrotreating'; Gasolio-non specificato	649-221-00-X
Distillati (petrolio), crackizzati con vapore, frazione C5-10 miscelati con nafta leggera da petrolio crackizzato con vapore frazione C5; Nafta con basso punto di ebollizione-non specificata	649-361-00-1
Distillati (petrolio), residuo della colonna di frazionamento di un impianto di reforming catalitico, altobollenti; Gasolio - non specificato	649-228-00-8
Distillati (petrolio), aromatici pesanti; Nafta di cracking termico con basso punto di ebollizione	649-318-00-7
Distillati (petrolio), frazioni paraffiniche leggere; Olio base non raffinato o mediamente raffinato	649-050-00-0
Distillati (petrolio), frazioni di testa del depentanizzatore; Nafta con basso punto di ebollizione - non specificata	649-363-00-2
Distillati (petrolio), frazioni nafteniche pesanti; Olio base non raffinato o mediamente raffinato	649-053-00-7
Distillati (petrolio), derivati da pirolisi di raffinato e nafta, miscelazione benzine; Nafta di cracking termico con basso punto di ebollizione	649-320-00-8
Distillati (petrolio), frazione paraffinica leggera trattata con acido; Olio base non raffinato o mediamente raffinato	649-057-00-9
Distillati (petrolio), da stripper di impianto 'unfining' di nafta; Nafta con basso punto di ebollizione-non specificata	649-376-00-3
Distillati (petrolio), frazione naftenica leggera neutralizzata chimicamente; Olio base non raffinato o mediamente raffinato	649-061-00-0
Distillati (petrolio), nafta e gasolio di cracking termico, contenenti dimero C5; Nafta di cracking termico con basso punto di ebollizione	649-323-00-4
Distillati (petrolio), frazione naftenica pesante trattata con acido; Olio base non raffinato o mediamente raffinato	649-054-00-2
Distillati (petrolio), nafta crackizzata a vapore a bagno di calore, ricchi di C5; Nafta con basso punto di ebollizione-non specificata	649-381-00-0
Distillati (petrolio), intermedi idrodesolforati; Gasolio-non specificato	649-223-00-0
Distillati (petrolio), leggeri, da cracking termico, aromatici debutanizzati; Nafta di cracking termico con basso punto di ebollizione	649-325-00-5
Distillati (petrolio), frazioni nafteniche leggere; Olio base non raffinato o mediamente raffinato	649-052-00-1
Distillati (petrolio), ricchi di C6; Nafta con basso punto di ebollizione-non specificata	649-388-00-9

Nome	Numero indice
Distillati (petrolio), frazione paraffiniche leggere neutralizzate chimicamente; Olio base non raffinato o mediamente raffinato	649-059-00-X
Distillati (petrolio), frazione intermedia trattata con argilla; Gasolio - non specificato	649-220-00-4
Distillati (petrolio), residuo della colonna di frazionamento di un impianto di reforming catalitico, a punto di ebollizione intermedio; Gasolio - non specificato	649-229-00-3
Distillati (petrolio), frazione naftenica leggera trattata con acido; Olio base mediamente raffinato o mediamente raffinato	649-055-00-8
Distillati (petrolio), frazioni paraffiniche pesanti neutralizzate chimicamente; Olio base non raffinato o mediamente raffinato	649-058-00-4
Distillati (petrolio), paraffinici leggeri trattati con carbone; Gasolio - non specificato	649-239-00-8
Distillati (petrolio), crackizzati con vapore, frazione C8-12, polimerizzati, frazioni leggere della distillazione; Nafta con basso punto di ebollizione-non specificata	649-390-00-X
Distillati (petrolio), derivati da cracking con vapore di nafta, leggeri da idrotrattamento raffinati con solvente; Nafta modificata con basso punto di ebollizione	649-283-00-8
Distillati (petrolio), C7-9, ricchi di C8, idrodesolforati dearomatizzati; Nafta con basso punto di ebollizione-non specificata	649-394-00-1
Distillati (petrolio), leggeri idrotrattati da reforming catalitico, frazione aromatica C8-12; Nafta di reforming catalitico con basso punto di ebollizione	649-309-00-8
Distillati (petrolio), distillati di "steam cracking" del petrolio crackizzati; Gasolio da cracking	649-441-00-6
Distillati (petrolio), crackizzati con vapor d'acqua; Cherosene da cracking	649-408-00-6
Distillati (petrolio), paraffinici leggeri decerati con solvente; Olio base non specificato	649-469-00-9
Distillati (petrolio), distillati di petrolio crackizzati con vapore sottoposti a stripping-cracking, frazione C8-10; Cherosene da cracking	649-409-00-1
Distillati (petrolio), leggeri da cracking catalitico, degradati termicamente; Gasolio da cracking	649-447-00-9
Distillati (petrolio), dal depentanizzatore di reforming catalitico; Nafta di reforming catalitico con basso punto di ebollizione	649-301-00-4
Distillati (petrolio), naftenici pesanti decerati con solvente; Olio base-non specificato	649-472-00-5
Distillati (petrolio), da nafta e gasolio di cracking termico, estrattivi; Nafta di cracking termico con basso punto di ebollizione	649-324-00-X
Distillati (petrolio), pesanti crackizzati con vapore; Gasolio da cracking	649-452-00-6
Distillati (petrolio), distillati di petrolio crackizzati con vapore sottoposti a stripping-cracking, frazione C10-12; Cherosene da cracking	649-410-00-7

Nome	Numero indice
Distillati (petrolio), naftenici leggeri decerati con solvente; Olio base-non specificato	649-473-00-0
Distillati (petrolio), crackizzati termicamente, ricchi di idrocarburi alchilaromatici; Cherosene da cracking	649-415-00-4
Distillati (petrolio), frazione paraffinica pesante raffinata con solvente; Olio base-non specificato	649-454-00-7
Distillati (petrolio), leggeri da catrame pesante crackizzato con vapore; Cherosene da cracking	649-418-00-0
Distillati (petrolio), frazione paraffinica pesante decerata con solvente; Olio base-non specificato	649-474-00-6
Distillati (petrolio), raffinati con solvente idrocrackizzati, deparaffinati; Olio base-non specificato	649-495-00-0
Distillati (petrolio), frazione naftenica pesante raffinata con solvente; Olio base-non specificato	649-457-00-3
Distillati (petrolio), frazione leggera di "hydrotreating"; Cherosene-non specificato	649-422-00-2
Distillati (petrolio), paraffinici pesanti deparaffinati complessi; Olio base-non specificato	649-485-00-6
Distillati (petrolio), frazioni leggere di cracking catalitico; Gasolio da cracking	649-435-00-3
Distillati (petrolio), frazione peraffinica pesante trattata con argilla; Olio base-non specificato	649-460-00-X
Distillati (petrolio), frazioni leggere di idrocracking; Gasolio da cracking	649-437-00-0
Distillati (petrolio), paraffinici leggeri deparaffinati complesso; Olio base-non specificato	649-486-00-1
Distillati (petrolio), idrodesolforati leggeri crackizzati cataliticamente; Gasolio da cracking	649-439-00-5
Distillati (petrolio), frazione naftenica pesante trattata con argilla; Olio base-non specificato	649-463-00-6
Distillati (petrolio), nafta e gasolio di cracking termico; Nafta di cracking termico con basso punto di ebollizione	649-322-00-9
Distillati (petrolio), paraffinici pesanti deparaffinati con solventi, trattati con argilla; Olio base-non specificato	649-487-00-7
Distillati (petrolio), aromatici leggeri; Nafta di cracking termico con basso punto di ebollizione	649-319-00-2
Distillati (petrolio), naftenici pesanti 'hydrotreating'; Olio base-non specificato	649-465-00-7
Distillati (petrolio), crackizzati a vapore, frazione C8-12; Cherosene da cracking	649-411-00-2
Distillati (petrolio), paraffinici leggeri deparaffinati con solvente, trattati con argilla; Olio base-non specificato	649-489-00-8
Distillati (petrolio), alchilato; Cherosene-non specificato	649-419-00-6
Distillati (petrolio), paraffinici pesanti 'hydrotreating'; Olio base-non specificato	649-467-00-8
Distillati (petrolio), pesanti idrotrattati raffinati con solvente, idrogenati; Olio base-non specificato	649-504-00-8

Nome	Numero indice
Distillati (petrolio), paraffinici leggeri deparaffinati con solvente; idrotrattati; Olio base-non specificato	649-490-00-3
Distillati (petrolio), frazione leggera idrocrackizzata raffinata con solvente; Olio base-non specificato	649-512-00-1
Distillati (petrolio), idrodesolforati intermedi da "coker"; Gasolio da cracking	649-451-00-0
Distillati (petrolio), residuo della colonna di frazionamento di un impianto di reforming catalitico, bassobollenti; Gasolio-non specificato	649-230-00-9
Distillati (petrolio), paraffinici pesanti deparaffinati, idrotrattati; Olio base-non specificato	649-493-00-X
Distillati (petrolio), leggeri da cracking catalitico di catrame pesante; Cherosene da cracking	649-416-00-X
Distillati (petrolio), frazione leggera idrocrackizzata raffinata con solvente; Olio base-non specificato	649-505-00-3
Distillati (petrolio), frazione pesante idrogenata raffinata con solvente; Olio base-non specificato	649-513-00-7
Distillati (petrolio), paraffinici intermedi, trattati con argilla; Gasolio-non specificato	649-241-00-9
Distillati (petrolio), naftenici leggeri raffinati con solvente, idrotrattati; Olio base-non specificato	649-496-00-6
Distillati (petrolio), frazione paraffinica leggera raffinata con solvente; Olio base-non specificato	649-455-00-2
Distillati (petrolio), paraffinici leggeri deparaffinati, idrotrattati; Olio base-non specificato	649-494-00-5
Distillati (petrolio), frazione paraffinica leggera trattata con argilla; Olio base-non specificato	649-461-00-3
Distillati (petrolio), frazione leggera neutralizzata chimicamente; Cherosene-non specificato	649-421-00-7
Distillati (petrolio), naftenici leggeri 'hydrotreating'; Olio base-non specificato	649-466-00-2
Distillati (petrolio), da reforming catalitico, concentrato di aromatici pesanti; Gasolio-non specificato	649-232-00-X
Distillati (petrolio), frazioni di testa dallo stabilizzatore del frazionamento benzina leggera di prima distillazione; Nafta con basso punto di ebollizione	649-272-00-8
Distillati (petrolio), frazioni leggere di cracking termico; Gasolio da cracking	649-438-00-X
Distillati (petrolio), frazioni pesanti di idrocracking; Olio base-non specificato	649-453-00-1
Distillati (petrolio), frazione naftenica leggera raffinata con solvente; Olio base-non specificato	649-458-00-9
Distillati (petrolio), frazione naftenica leggera trattata con argilla; Olio base-non specificato	649-464-00-1
Distillati (petrolio), paraffinici leggeri di 'hydrotreating'; Olio di base-non specificato	649-468-00-3

Estratti (petrolio), frazione naftenica leggera distillata con solvente	649-001-00-3
Estratti (petrolio), frazione paraffinica pesante distillata con solvente	649-002-00-9
Estratti (petrolio), distillati naftenici pesanti con solvente	649-004-00-X
Estratti (petrolio), estrazione acida a freddo, C4-6: Nafta con basso punto di ebollizione-non specificata	649-362-00-7
Estratti (petrolio), distillati paraffinici pesanti, deasfaltati con solvente;	
Estratto aromatico distillato (trattato)	649-533-00-6
Estratti (petrolio), solvente distillato naftenico pesante, idrotrattato;	
Estratto aromatico distillato (trattato)	649-534-00-1
Estratti (petrolio), solvente nafta pesante, trattata con argilla: Nafta con basso punto di ebollizione-non specificata	649 391-00-5
Estratti (petrolio), con solvente, da distillato naftenico pesante, concentrato in aromatici; Estratto aromatico distillato (trattato)	649-531-00-5
Estratti (petrolio), con solvente, da distillato paraffinico pesante raffinato con solvente; Estratto aromatico distillato (trattato)	649-532-00-0
Estratti (petrolio), nafta solvente leggera da reforming catalitico: Nafta con basso punto di ebollizione-non specificata	649-382-00-6
Estratti (petrolio), nafta solvente pesante: Cherosene-non specificato	649-420-00-1
Estratti (petrolio), solvente distillato paraffinico pesante, idrotrattati;	
Estratto aromatico distillato (trattato)	649-535-00-7
Estratti (petrolio), solvente distillato paraffinico leggero, idrotrattati;	
Estratto aromatico distillato (trattato)	649-536-00-2
Estratti (petrolio), solvente distillato paraffinico leggero idrotrattato ;	
Estratto aromatico distillato (trattato)	649-537-00-8
Estratti (petrolio), solvente distillato paraffinico leggero, trattati con acido; Estratto aromatico distillato (trattato)	649-539-00-9
Estratti (petrolio), distillato paraffinico leggero, idrodesolforati;	
Estratto aromatico distillato (trattato)	649-540-00-4
Estratti (petrolio), solvente gasolio leggero sotto vuoto, idrotrattati;	
Estratto aromatico distillato (trattato)	649-541-00-X
Estratti (petrolio), gasolio leggero sotto vuoto solvente, trattato con argilla; Estratto aromatico distillato (trattato)	649-548-00-8

Nome	Numero indice
Estratti (petrolio), distillato solvente paraffinico pesante, trattati con argilla; Estratto aromatico distillato (trattato)	649-542-00-5
Estratti (petrolio), solvente distillato paraffinico pesante decerato con solvente, idrodesolfato; Estratto aromatico distillato (trattato)	649-544-00-6
Estratti (petrolio), solvente distillato paraffinico leggero, trattato con argilla; Estratto aromatico distillato (trattato)	649-546-00-7
Estratti (petrolio), leggeri sotto vuoto, gasolio solvente, trattati con carbone; Estratto aromatico distillato (trattato)	649-547-00-2
Estratti (petrolio), solvente distillato naftenico pesante, idrodesolfato; Estratto aromatico distillato (trattato)	649-543-00-0
Estratti (petrolio), distillato paraffinico leggero solvente, trattato con carbone; Estratto aromatico distillato (trattato)	649-545-00-1
Estratti (petrolio), solvente di distillato naftenico leggero, idrodesolfato; Estratto aromatico distillato (trattato)	649-538-00-3
Estratti residui (carbone), catrame di carbone alcalino a bassa temperatura	648-110-00-3
Estratti, olio di catrame di carbone, alcalini; Estratto alcalino	648-113-00-X

Gas (petrolio), dallo stabilizzatore di platforming, frazionamento componenti leggeri: Gas di raffineria	649-161-00-4
Gas (petrolio), di raffineria: Gas di raffineria	649-153-00-0
Gas (petrolio), distillazione riassorbitore concentrazione gas: Gas di raffineria	649-130-00-5
Gas (petrolio), distillazione da cracking termico	649-139-00-4
Gas (petrolio), effluente da idrodesulfurazione di gasolio: Gas di raffineria	649-170-00-3
Gas (petrolio), frazione di testa stabilizzatore nafta polimerizzata cataliticamente, ricchi di C2-4: Gas di petrolio	649-065-00-2
Gas (petrolio), frazioni di testa della colonna del deisobutanizzatore: Gas di petrolio	649-070-00-X
Gas (petrolio), frazioni di testa depropanizzatore impianto recupero gas: Gas di petrolio	649-073-00-6
Gas (petrolio), frazioni di testa del depropanizzatore: Gas di petrolio	649-072-00-0
Gas (petrolio), frazioni di testa di splitter di cracking catalitico fluidizzato: Gas di petrolio	649-105-00-9
Gas (petrolio), frazioni di testa del depentanizzatore di idrotrattamento dell'unita' benzene: Gas di raffineria	649-149-00-9
Gas (petrolio), frazioni di testa del deetanizzatore: Gas di petrolio	649-069-00-4
Gas (petrolio), frazioni di testa dello splitter del butano: Gas di petrolio	649-206-00-8
Gas (petrolio), frazionati di benzina pesante isomerizzata, arricchiti in C4, esenti da idrogeno solforato: Gas di petrolio	649-075-00-7
Gas (petrolio), frazioni di testa crackizzate cataliticamente: Gas di petrolio	649-191-00-8
Gas (petrolio), hydrocracking, dal separatore a bassa pressione: Gas di raffineria	649-152-00-5
Gas (petrolio), idrotrattamento, reforming: Gas di raffineria	649-136-00-8
Gas (petrolio), idrotrattamento-reforming, ricchi di idrogeno-metano: Gas di raffineria	649-137-00-3
Gas (petrolio), impianto di reforming catalitico, ricchi di C1-4: Gas di petrolio	649-066-00-8

Nome	Numero indice
Gas (petrolio), miscela di raffineria: Gas di petrolio	649-097-00-7
Gas (petrolio), nafta dal reforming catalitico, teste dello stripper Gas di raffineria	649-124-00-2
Gas (petrolio), nafta crackizzata cataliticamente, frazioni di fondo del debutanizzatore: ricchi di C3-5: Gas di petrolio	649-209-00-4
Gas (petrolio), nafta crackizzata cataliticamente, frazioni di testa del depropanizzatore, ricchi di C3 privi di acido: Gas di petrolio	649-062-00-6
Gas (petrolio), nafta di prima distillazione, frazione di testa stabilizzatore reforming catalitico: Gas di petrolio	649-112-00-7
Gas (petrolio), residui di cracking con vapore ad alta pressione di nafta: Gas di raffineria	649-173-00-X
Gas (petrolio), residuo 'visbreaking': Gas di raffineria	649-174-00-5
Gas (petrolio), ricchi di C4: Gas di petrolio	649-068-00-9
Gas (petrolio), ricchi di idrogeno: Gas di raffineria	649-132-00-6
Gas (petrolio), riciclo dall'impianto benzene, ricchi di idrogeno Gas di raffineria	649-122-00-1
Gas (petrolio), riciclo olio di miscela idrotrattato, ricchi di idrogeno-azoto: Gas di raffineria	649-133-00-1
Gas (petrolio), riciclo reformer catalitico di C6-8, arricchiti di idrogeno: Refinery gas	649-127-00-9
Gas (petrolio), riciclo, ricchi di idrogeno: Gas di raffineria	649-134-00-7
Gas (petrolio), scarico da flash drum di effluente dell'idrogenatore Gas di raffineria	649-172-00-4
Gas (petrolio), scarico di scrubber di gasolio a dietanolamina Gas di raffineria	649-169-00-8
Gas (petrolio), secchi dal depropanizzatore, ricchi di propilene Gas di petrolio	649-071-00-5
Gas (petrolio), secchi leggermente acidi, dall'impianto di concentrazione gas Gas di raffineria	649-129-00-X
Gas (petrolio), spurgo dell'idrodesolforazione del gasolio Gas di raffineria	649-171-00-9
Gas (petrolio), tagli di testa nafta di prima distillazione sottoposta a reforming catalitico Gas di raffineria	649-145-00-7
Gas (petrolio), dal depropanizzatore di idrocracking, ricchi di idrocarburi, Gas di petrolio	649-085-00-1
Gas combustibili, distillati di petrolio grezzo, Gas di petrolio	649-198-00-6
Gas combustibili, Gas di petrolio	649-197-00-0
Gas di coda (petrolio), da torre di riflusso frazionamento olio purificato di cracking catalitico e residuo sotto vuoto di cracking termico, Gas di petrolio	649-076-00-2
Gas di coda (petrolio), assorbitore di stabilizzazione nafta crackizzata cataliticamente, Gas di petrolio	649-077-00-8
Gas di coda (petrolio), dai processi di cracking e reforming catalitico e dal frazionatore combinato con l'idrodesolforatore, Gas di petrolio	649-078-00-3
Gas di coda (petrolio), dalla stabilizzazione per frazionamento di nafta riformata cataliticamente, Gas di petrolio	649-079-00-9

Nome	Numero indice
Gas di coda (petrolio), idrodesolforato dall'impianto di stripping del gasolio, privi di idrogeno solforato; Gas di petrolio	649-187-00-6
Gas di coda (petrolio), nafta di prima distillazione dallo stabilizzatore, privi di idrogeno solforato; Gas di petrolio	649-188-00-1
Gas di coda (petrolio), nafta isomerizzata dallo stabilizzatore di frazionamento; Gas di petrolio	649-210-00-X
Gas di coda (petrolio), separatore nafta riformata cataliticamente; Gas di raffineria	649-141-00-5
Gas di coda (petrolio), alchilazione propano-propilene, preparazione carica deetanizzatore; Gas di petrolio	649-189-00-7
Gas di coda (petrolio), gasolio sotto vuoto dall'idrodesolforatore, privi di idrogeno solforato; Gas di petrolio	649-190-00-2
Gas di coda (petrolio), da stabilizzazione per frazionamento di idrocarburi crackizzati termicamente, coking del petrolio; Gas di petrolio	649-110-00-6
Gas di coda (petrolio), impianto di recupero di gas saturo, ricco di C1 2; Gas di petrolio	649-081-00-X
Gas di coda (petrolio), da stabilizzatore di nafta e distillato crackizzati cataliticamente; Gas di petrolio	649-108-00-5
Gas di coda (petrolio), cracking catalitico di gasolio, torre di assorbimento; Gas di petrolio	649-183-00-4
Gas di coda (petrolio), separatore nafta di prima distillazione idrodesolforata; Gas di raffineria	649-144-00-1
Gas di coda (petrolio), impianto di recupero gas; Gas di petrolio	649-184-00-X
Gas di coda (petrolio), da idrodesolforatore di nafta di prima distillazione; Gas di raffineria	649-166-00-1
Gas di coda (petrolio), impianto di recupero gas, deetanizzatore; Gas di petrolio	649-185-00-5
Gas di coda (petrolio), nafta di polimerizzazione catalitica, stabilizzante di frazionamento; Gas di petrolio	649-179-00-2
Gas di coda (petrolio), distillato di prima distillazione dell'idrodesolforatore, privo di idrogeno solforato; Gas di petrolio	649-182-00-9
Gas di coda (petrolio), distillato idrodesolforato e nafta idrodesolforata dal frazionatore, privi di acidi; Gas di petrolio	649-186-00-0
Gas di coda (petrolio), da separatore di nafta idrodesolforata cataliticamente; Gas di raffineria	649-165-00-6
Gas di coda (petrolio), distillato crackizzato cataliticamente e nafta crackizzata cataliticamente, colonna di frazionamento ad assorbimento; Gas di petrolio	649-178-00-7
Gas di coda (petrolio), nafta riformata cataliticamente, stabilizzante di frazionamento, privi di idrogeno solforato; Gas di petrolio	649-180-00-8
Gas di coda (petrolio), distillato crackizzato, stripper di "hydrotreating"; Gas di petrolio	649-181-00-3
Gas di coda (petrolio), corrente mista impianto di gas saturo, ricco di C4; Gas di petrolio	649-080-00-4
Gas di coda (petrolio), dall'impianto di cracking termico di residui sotto vuoto; Gas di petrolio	649-082-00-5

Nome	Numero indice
Gas di coda (petrolio), da assorbitore di nafta, gasolio e distillato crackizzati termicamente; Gas di petrolio	649-109-00-0
Gas di coda (petrolio), dall'assorbitore di rifrazionamento dell'apparecchiatura di cracking catalitico; Gas di raffineria	649-140-00-X
Gas di coda (petrolio), stabilizzatore nafta riformata cataliticamente; Gas di raffineria	649-142-00-0
Gas di coda (petrolio), separatore di idrotrattamento del distillato crackizzato; Gas di raffineria	649-143-00-6
Gas di petrolio, liquefatti, addolciti, frazione C4; Gas di petrolio	649-117-00-4
Gas di petrolio, liquefatti; Gas di petrolio	649-202-00-6
Gas di petrolio, liquefatti, addolciti; Gas di petrolio	649-203-00-1
Gas naturale (petrolio), miscela liquida grezza; Nafta con basso punto di ebollizione - non specificata	649-347-00-5
Gas naturale, condensati (petrolio); Nafta con basso punto di ebollizione, non specificata	649-346-00-X
Gas naturale, condensati; Nafta con basso punto di ebollizione-non specificata	649-375-00-8
Gasoli (petrolio), crackizzati con vapore d'acqua: Gasolio da cracking	649-442-00-1
Gasoli (petrolio), da hydrotreating sotto vuoto: Olio combustibile denso	649-015-00-X
Gasoli (petrolio), frazioni pesanti sotto vuoto: Olio combustibile denso	649-009-00-7
Gasoli (petrolio), idrodesolforati: Gasolio-non specificato	649-222-00-5
Gasoli (petrolio), leggeri sotto vuoto, idrodesolforati crackizzati termicamente	649-450-00-5
Gasoli (petrolio), neutralizzati chimicamente: Gasolio-non specificato	649-218-00-3
Gasoli (petrolio), pesanti sotto vuoto da coker idrodesolforati: Olio combustibile denso	649-039-00-0
Gasoli (petrolio), pesanti idrodesolforati sotto vuoto: Olio combustibile denso	649-017-00-0
Gasoli (petrolio), pesanti, distillazione atmosferica: Olio combustibile denso	649-032-00-2
Gasoli (petrolio), raffinati con solvente: Gasolio-non specificato	649-213-00-6
Gasoli (petrolio), trattati con acido: Gasolio-non specificato	649-215-00-7
Gasoli, idrotrattati: Gasolio-non specificato	649-238-00-2
Gasoli, paraffinici: Gasolio-non specificato	649-233-00-5
Giallo di piombo solfocromato	082-009-00-X
Glicerina trinitrato	603-034-00-X
Glicidile acrilato	607-117-00-1
Glicidile metacrilato	607-123-00-4
Glicidolo	603-063-00-8
Glicol etilenico	603-027-00-1
Glifosina	015-125-00-6

Idrazina, sali	007-014-00-6
Idrazobenzene	007-021-00-4
Idrocarburi, arricchiti in C5	649-402-00-3
Idrocarburi aromatici, C9-12, distillazione del benzene: Olio leggero ridistillato, frazione altobollente	648-013-00-6
Idrocarburi aromatici, C ₉ =10 da cracking con vapore, idrotrattati: Cherosene da cracking	649-413-00-3
Idrocarburi aromatici, C8-9, sottoprodotto della polimerizzazione di resine idrocarburiche: olio leggero ridistillato, frazione altobollente	648-012-00-0
Idrocarburi aromatici, C20-28, policiclici, derivati da pirolisi mista pece di catrame di carbone-polietilene: Prodotti di pirolisi	648-074-00-9
Idrocarburi aromatici, C20-28, policiclici, derivati da pirolisi mista pece di catrame di carbone-polistirene: Prodotti di pirolisi	648-075-00-4
Idrocarburi aromatici, C6-10, ricchi di C8: olio leggero ridistillato frazione bassobollente	648-005-00-2
Idrocarburi aromatici, C7-12, ricchi di C8: Nafta di reforming catalitico con basso punto di ebollizione	649-311-00-9
Idrocarburi aromatici, C8, derivati da reforming catalitico: Nafta di reforming catalitico con basso punto di ebollizione	649-310-00-3
Idrocarburi aromatici, C8; Olio leggero ridistillato, frazione altobollente	648-010-00-X
Idrocarburi aromatici, C20-28, policiclici, derivati da pirolisi mista pece di catrame di carbone-polietilene-polipropilene: Prodotti di pirolisi	648-073-00-3
Idrocarburi aromatici, C6-8, derivati da pirolisi di raffinato e nafta: Nafta di cracking termico con basso punto di ebollizione	649-321-00-3
Idrocarburi aromatici, C6-10, trattati con acido, neutralizzati: Nafta con basso punto di ebollizione-non specificata	649-357-00-X
Idrocarburi aromatici, C8-10; Nafta con basso punto di ebollizione-non specificata	649-403-00-9
Idrocarburi aromatici, C7-8, prodotti di dealchilazione, residui di distillazione: Nafta con basso punto di ebollizione-non specificata	649-379-00-X
Idrocarburi C1-3; Gas di petrolio	649-090-00-9
Idrocarburi C1-4, frazione debutanizzatore; Gas di petrolio	649-091-00-4
Idrocarburi C1-4; Gas di petrolio	649-088-00-8

Nome	Numero indice
Idrocarburi C16-20, residuo della distillazione di paraffine da idrocracking decerati con solvente	649-449-00-X
Idrocarburi C26-55, ricchi di aromatici	649-006-00-0
Idrocarburi C3-6, ricchi di C5, nafta crackizzata con vapore; Nafta con basso punto di ebollizione-non specificata	649-398-00-3
Idrocarburi C4-6, leggeri da depentanizzatore, hydrotreating aromatico; Nafta con basso punto di ebollizione-non specificata	649-380-00-5
Idrocarburi, C \geq 5, arricchiti in C5-6	649-401-00-8
Idrocarburi, C1-4, addolciti; Gas di petrolio	649-089-00-3
Idrocarburi, C11-17, naftenici leggeri estratti con solvente; Gasolio-non specificato	649-237-00-7
Idrocarburi, C12-20, paraffinici idrotrattati, frazioni leggere della distillazione; Gasolio-non specificato	649-236-00-1
Idrocarburi, C13-17, naftenici leggeri estratti con solvente; Olio base-non specificato	649-517-00-9
Idrocarburi, C13-30, ricchi di aromatici, distillato naftenico estratto con solvente; olio base-non specificato	649-508-00-X
Idrocarburi, C14-29, naftenici leggeri estratti con solvente; Olio base-non specificato	649-518-00-4
Idrocarburi, C16-20 idrotrattati distillato intermedio, frazioni leggere della distillazione; Gasolio-non specificato	649-235-00-6
Idrocarburi, C16-32, ricchi di aromatici, distillato naftenico estratto con solvente; Olio base-non specificato	649-509-00-5
Idrocarburi, C17-30, distillati idrotrattati, frazioni leggere della distillazione; Olio base-non specificato	649-520-00-5
Idrocarburi, C17-30, residuo della distillazione atmosferica deasfaltato con solvente idrotrattato, frazioni leggere della distillazione; Olio base-non specificato	649-515-00-8
Idrocarburi, C17-40, residuo della distillazione idrotrattato deasfaltato con solvente, frazioni leggere della distillazione sotto vuoto; Olio base-non specificato	649-516-00-3
Idrocarburi, C2-4, arricchiti in C3; Gas di petrolio	649-201-00-0
Idrocarburi, C2-4; Gas di petrolio	649-093-00-5
Idrocarburi, C2-6, C6-8, da reforming catalitico di C6-8; Nafta di reforming catalitico con basso punto di ebollizione	649-302-00-X
Idrocarburi, C20-50, distillato sotto vuoto dell'idrogenazione dell'olio residuo; Olio base-non specificato	649-503-00-2
Idrocarburi, C20-50, paraffinici pesanti deparaffinati con solvente, idrotrattati; Olio base-non specificato	649-488-00-2
Idrocarburi, C20-58, idrotrattati; Olio base-non specificato	649-523-00-1
Idrocarburi, C27-42, dearomatizzati; Olio base-non specificato	649-519-00-X
Idrocarburi, C27-42, naftenici; Olio base-non specificato	649-524-00-7
Idrocarburi, C27-45, distillazione naftenica sotto vuoto; Olio base-non specificato	649-521-00-0
Idrocarburi, C27-45, dearomatizzati; Olio base-non specificato	649-522-00-6
Idrocarburi, C3; Gas di petrolio	649-094-00-0

Nome	Numero indice
Idrocarburi, C3-11, distillati di cracking catalitico; Nafta di cracking catalitico con basso punto di ebollizione	649-291-00-1
Idrocarburi, C3-4; Gas di petrolio	649-199-00-1
Idrocarburi, C37-65, residui della distillazione sotto vuoto idrotrattati deasfaltati: Olio base-non specificato	649-511-00-6
Idrocarburi, C37-68, residui della distillazione sotto vuoto decerati deasfaltati idrotrattati: Olio base-non specificato	649-510-00-0
Idrocarburi, C4, distillato da cracker a vapore; Gas di petrolio	649-116-00-9
Idrocarburi, C4, Gas di petrolio	649-113-00-2
Idrocarburi, C4, privi di 1,3-butadiene e isobutene; Gas di petrolio	649-118-00-X
Idrocarburi, C4-11, cracking di nafta, privi di aromatici; Nafta con basso punto di ebollizione-non specificata	649-386-00-8
Idrocarburi, C4-12, cracking della nafta, idrotrattati; Nafta di "hydrotreating con basso punto di ebollizione	649-340-00-7
Idrocarburi, C4-5; Gas di petrolio	649-200-00-5
Idrocarburi, C5-11, ricchi di non aromatici, frazione leggera da reforming; Nafta di reforming catalitico con basso punto di ebollizione	649-314-00-5
Idrocarburi, C6-11, idrotrattati, dearomatizzati: Nafta di "hydrotreating" con basso punto di ebollizione	649-343-00-3
Idrocarburi, C6-7, cracking di nafta, raffinati con solvente, Nafta modificata con basso punto di ebollizione	649-287-00-X
Idrocarburi, C6-8, idrogenati dearomatizzati per assorbimento, raffinazione del toluene: Nafta con basso punto di ebollizione-non specificata	649-395-00-7
Idrocarburi, C7-12, ricchi di aromatici C>9, frazione pesante da reforming; Nafta di reforming catalitico con basso punto di ebollizione	649-313-00-X
Idrocarburi, C8-12, da cracking catalitico, neutralizzati chimicamente:	
Nafta di cracking catalitico con basso punto di ebollizione	649-296-00-9
Idrocarburi, C8-12, distillati da cracking catalitico: Nafta di cracking catalitico con basso punto di ebollizione	649-297-00-4
Idrocarburi, C8-12, da cracking catalitico, neutralizzati chimicamente, addolciti: Nafta di cracking catalitico con basso punto di ebollizione	649-298-00-X
Idrocarburi, C9-12, idrotrattati, dearomatizzati: Nafta di "hydrotreating" con basso punto di ebollizione	649-344-00-9
Idrocarburi, C9-16, idrotrattati, dearomatizzati, Cherosene, non specificato	649-429-00-0
Idrocarburi, distillati leggeri di nafta idrotrattati, raffinati con solvente; Nafta modificata con basso punto di ebollizione	649-285-00-9
Idrocarburi, residui paraffinici idrocrackizzati della distillazione, decerati con solvente: Olio base-non specificato	649-502-00-7
Idrocarburi, ricchi di C3-4, distillato di petrolio, Gas di petrolio	649-083-00-0
Idrocarburi, ricchi di C6, distillati leggeri di nafta idrotrattati, raffinati con solventi: Nafta modificata con basso punto di ebollizione	649-288-00-5

Nafta (petrolio), C4-12 butan-alchilato, ricca di isottano: Nafta modificata con basso punto di ebollizione	649-284-00-3
Nafta (petrolio), contenente aromatici: Nafta con basso punto di ebollizione-non specificata	649-372-00-1
Nafta (petrolio), crackizzata a vapore, idrotrattata, ricchi di aromatici C9-10: Cherosene da cracking	649-414-00-9
Nafta (petrolio), da reforming catalitico: Nafta di reforming catalitico con basso punto di ebollizione	649-308-00-2
Nafta (petrolio), da cracking leggero con vapore, trattata termicamente: Nafta con basso punto di ebollizione - non specificata	649-393-00-6
Nafta (petrolio), decerata cataliticamente: Nafta con basso punto di ebollizione-non specificata	649-354-00-3
Nafta (petrolio), distillazione primaria dell'intera gamma: Nafta con basso punto di ebollizione	649-265-00-X
Nafta (petrolio), distillato leggero di cracking catalitico: Nafta di cracking catalitico con basso punto di ebollizione	649-292-00-7

Nome	Numero indice
Nafta (petrolio), frazioni pesanti di distillazione primaria: Nafta con basso punto di ebollizione	649-264-00-4
Nafta (petrolio), frazioni pesanti di alchilazione: Nafta modificata con basso punto di ebollizione	649-275-00-4
Nafta (petrolio), frazioni leggere di alchilazione: Nafta modificata con basso punto di ebollizione	649-276-00-X
Nafta (petrolio), frazione leggera raffinata con solventi: Nafta modificata con basso punto di ebollizione	649-278-00-0
Nafta (petrolio), frazione pesante raffinata con solvente: Nafta modificata con basso punto di ebollizione	649-279-00-6
Nafta (petrolio), frazione leggera neutralizzata chimicamente: Nafta con basso punto di ebollizione-non specificata	649-353-00-8
Nafta (petrolio), frazione leggera crackizzata con vapore d'acqua, priva di benzene: Nafta con basso punto di ebollizione-non specificata	649-371-00-6
Nafta (petrolio), frazioni leggere di cracking catalitico: Nafta di cracking catalitico con basso punto di ebollizione	649-290-00-6
Nafta (petrolio), frazione leggera, addolcita: Nafta con basso punto di ebollizione-non specificata	649-374-00-2
Nafta (petrolio), frazioni leggere di idrocracking: Nafta con basso punto di ebollizione-Non specificata	649-348-00-0
Nafta (petrolio), frazioni leggere, distillazione primaria: Nafta con basso punto di ebollizione	649-266-00-5
Nafta (petrolio), frazioni leggere di cracking termico: Nafta di cracking termico con basso punto di ebollizione	649-317-00-1
Nafta (petrolio), frazione leggera di "hydrotreating": Nafta di "hydrotreating" con basso punto di ebollizione	649-328-00-1
Nafta (petrolio), frazioni leggere di cracking termico: Nafta di cracking termico con basso punto di ebollizione	649-316-00-6
Nafta (petrolio), frazioni pesanti da idrocracking: Nafta con basso punto di ebollizione-non specificata	649-349-00-6
Nafta (petrolio), frazione pesante neutralizzata chimicamente: Nafta con basso punto di ebollizione-non specificata	649-352-00-2
Nafta (petrolio), frazioni pesanti di cracking catalitico: Nafta di cracking catalitico con basso punto di ebollizione	649-289-00-0
Nafta (petrolio), frazioni leggere di reforming catalitico: Nafta di reforming catalitico con basso punto di ebollizione	649-299-00-5
Nafta (petrolio), frazioni pesanti di reforming catalitico: Nafta di reforming catalitico con basso punto di ebollizione	649-300-00-9
Nafta (petrolio), frazione pesante di "hydrotreating": Nafta di hydrotreating con basso punto di ebollizione	649-327-00-6
Nafta (petrolio), gamma completa idrodesolforata: Nafta di "hydrotreating" con basso punto di ebollizione	649-338-00-6
Nafta (petrolio), gamma completa di tagli da apparecchio di cokizzazione: Nafta con basso punto di ebollizione-non specificata	649-366-00-9
Nafta (petrolio), gamma completa frazioni di alchilato, contenente butano: Nafta modificata con basso punto di ebollizione	649-282-00-2

Nome	Numero indice
Nafta (petrolio), idrodesolforata taglio intero da "coker": Nafta con basso punto di ebollizione-non specificata	649-396-00-2
Nafta (petrolio), isomerizzazione: Nafta modificata con basso punto di ebollizione	649-277-00-5
Nafta (petrolio), isomerizzazione, frazione C6: Nafta modificata con basso punto di ebollizione	649-286-00-4
Nafta (petrolio), leggera crackizzata cataliticamente addolcita: Nafta di cracking catalitico con basso punto di ebollizione	649-295-00-3
Nafta (petrolio), leggera crackizzata termicamente, addolcita: Nafta di cracking termico con basso punto di ebollizione	649-326-00-0
Nafta (petrolio), leggera idrodesolforata: Nafta di "hydrotreating" con basso punto di ebollizione	649-329-00-7
Nafta (petrolio), leggera idrotrattata crackizzata a vapore: Nafta di "hydrotreating" con basso punto di ebollizione	649-339-00-1
Nafta (petrolio), leggera da cracking con vapore, idrogenata: Nafta di "hydrotreating" con basso punto di ebollizione	649-342-00-8
Nafta (petrolio), leggera crackizzata con vapore acqueo: Nafta con basso punto di ebollizione-non specificata	649-355-00-9
Nafta (petrolio), leggera idrodesolforata, dearomatizzata: Nafta con basso punto di ebollizione-non specificata	649-383-00-1
Nafta (petrolio), leggera, ricca di C5, addolcita: Nafta con basso punto di ebollizione-non specificata	649-384-00-7
Nafta (petrolio), leggera idrotrattata, contenente cicloalcani: Nafta di "hydrotreating" con basso punto di ebollizione	649-336-00-5
Nafta (petrolio), leggera addolcita: Nafta con basso punto di ebollizione-non specificata	649-397-00-8
Nafta (petrolio), leggera da bagno di calore ("heat-soaked"), da cracking con vapore: Nafta con basso punto di ebollizione-non specificata	649-387-00-3
Nafta (petrolio), leggera crackizzata termicamente idrodesolforata: Nafta di "hydrotreating" con basso punto di ebollizione	649-335-00-X
Nafta (petrolio), non addolcita: Nafta con basso punto di ebollizione	649-271-00-2
Nafta (petrolio), pesante crackizzata cataliticamente, addolcita: Nafta di cracking catalitico con basso punto di ebollizione	649-294-00-8
Nafta (petrolio), pesante crackizzata con vapore, idrogenata: Nafta di "hydrotreating" con basso punto di ebollizione	649-337-00-0
Nafta (petrolio), pesante idrodesolforata da reforming catalitico, frazione aromatica; Cherosene-non specificato	649-426-00-4
Nafta (petrolio), pesante di prima distillazione, contenente aromatici; Nafta con basso punto di ebollizione	649-273-00-3
Nafta (petrolio), pesante idrodesolforata: Nafta di "hydrotreating" con basso punto di ebollizione	649-330-00-2
Nafta (petrolio), prima distillazione, gamma completa di frazioni trattata con argilla; Nafta con basso punto di ebollizione-non specificata	649-368-00-X
Nafta (petrolio), prima distillazione, frazione leggera trattata con argilla; Nafta con basso punto di ebollizione-non specificata	649-369-00-5

Nome	Numero indice
Nafta (petrolio), raffinata con solvente idrodesolforata pesante; Gasolio-non specificato	649-234-00-0
Nafta (petrolio), taglio leggero di reforming catalitico, privi di composti aromatici; Nafta di reforming catalitico con basso punto di ebollizione	649-304-00-0
Nafta (petrolio), tagli aromatici medi crackizzati con vapore; Nafta con basso punto di ebollizione-non specificata	649-367-00-4
Nafta (petrolio), trattata con acido; Nafta con basso punto di ebollizione-non specificata	649-351-00-7
Nafta (petrolio), frazione di alchilazione dell'intera gamma: Nafta modificata con basso punto di ebollizione	649-274-00-9
Nafta (petrolio), frazione aromatica leggera crackizzata con vapore d'acqua: Nafta con basso punto di ebollizione-non specificata	649-370-00-0
Nafta solvente (carbone), contenente cumarone-indene; olio leggero ridistillato, frazione intermedia	648-008-00-9
Nafta solvente (carbone), taglio xilene-stirene; Olio leggero ridistillato, frazione intermedia	648-007-00-3
Nafta solvente (petrolio), alifatica leggera; Nafta con basso punto di ebollizione	649-267-00-0
Nafta solvente (petrolio), frazione aromatica leggera, idrotrattata; Nafta di "hydrotreating" con basso punto di ebollizione	649-334-00-4
Nafta solvente (petrolio), naftenica leggera idrotrattata; Nafta di "hydrotreating" con basso punto di ebollizione	649-341-00-2
Nafta solvente (petrolio), aromatica leggera; Nafta con basso punto di ebollizione-non specificata	649-356-00-4
Nafta solvente (petrolio), alifatica intermedia: Cherosene di prima distillazione	649-405-00-X
Nafta solvente (petrolio), alifatica pesante: Cherosene di prima distillazione	649-406-00-5
Nafta solvente (petrolio), idrocrackizzata pesante aromatica: Cherosene da cracking	649-417-00-5
Nafta solvente (petrolio), aromatica pesante: Cherosene non specificato	649-424-00-3
Nafta solvente (petrolio), aromatica pesante idrodesolforata: Cherosene non specificato	649-432-00-7
Nafta solvente (petrolio), idrodesolforata intermedia: Cherosene-non specificato	649-433-00-2
Nafta solvente,(carbone), leggera: olio leggero ridistillato, frazione basso bollente	648-006-00-8

ALLEGATO III

Elenco delle frasi di rischio

- R 1 Esplosivo allo stato secco.
- R 2 Rischio di esplosione per urto, sfregamento, fuoco o altre sorgenti d'ignizione.
- R 3 Elevato rischio di esplosione per urto, sfregamento, fuoco o altre sorgenti d'ignizione.
- R 4 Forma composti metallici esplosivi molto sensibili.
- R 5 Pericolo di esplosione per riscaldamento.
- R 6 Esplosivo a contatto o senza contatto con l'aria.
- R 7 Può provocare un incendio.
- R 8 Può provocare l'accensione di materie combustibili.
- R 9 Esplosivo in miscela con materie combustibili.
- R 10 Infiammabile.
- R 11 Facilmente infiammabile.
- R 12 Estremamente infiammabile.
- R 14 Reagisce violentemente con l'acqua.
- R 15 A contatto con l'acqua libera gas estremamente infiammabili.
- R 16 Pericolo di esplosione se mescolato con sostanze comburenti.
- R 17 Spontaneamente infiammabile all'aria.
- R 18 Durante l'uso può formare con aria miscele esplosive/infiammabili.
- R 19 Può formare perossidi esplosivi.
- R 20 Nocivo per inalazione.
- R 21 Nocivo a contatto con la pelle.
- R 22 Nocivo per ingestione.
- R 23 Tossico per inalazione.
- R 24 Tossico a contatto con la pelle.
- R 25 Tossico per ingestione.
- R 26 Molto tossico per inalazione.
- R 27 Molto tossico a contatto con la pelle.
- R 28 Molto tossico per ingestione.
- R 29 A contatto con l'acqua libera gas tossici.
- R 30 Può divenire facilmente infiammabile durante l'uso.
- R 31 A contatto con acidi libera gas tossico.
- R 32 A contatto con acidi libera gas altamente tossico.
- R 33 Pericolo di effetti cumulativi.
- R 34 Provoca ustioni.
- R 35 Provoca gravi ustioni.
- R 36 Irritante per gli occhi.
- R 37 Irritante per le vie respiratorie.
- R 38 Irritante per la pelle.
- R 39 Pericolo di effetti irreversibili molto gravi.
- R 40 Possibilità di effetti irreversibili.
- R 41 Rischio di gravi lesioni oculari.
- R 42 Può provocare sensibilizzazione per inalazione.
- R 43 Può provocare sensibilizzazione per contatto con la pelle.
- R 44 Rischio di esplosione per riscaldamento in ambiente confinato.
- R 45 Può provocare il cancro.

- R 46 Può provocare alterazioni genetiche ereditarie.
R 48 Pericolo di gravi danni per la salute in caso di esposizione prolungata.
R 49 Può provocare il cancro per inalazione.
R 50 Altamente tossico per gli organismi acquatici.
R 51 Tossico per gli organismi acquatici.
R 52 Nocivo per gli organismi acquatici.
R 53 Può provocare a lungo termine effetti negativi per l'ambiente acquatico.
R 54 Tossico per la flora.
R 55 Tossico per la fauna.
R 56 Tossico per gli organismi del terreno.
R 57 Tossico per le api
R 58 Può provocare a lungo termine effetti negativi per l'ambiente
R 59 Pericoloso per lo strato di ozono.
R 60 Può ridurre la fertilità
R 61 Può danneggiare i bambini non ancora nati.
R 62 Possibile rischio di ridotta fertilità.
R 63 Possibile rischio di danni ai bambini non ancora nati.
R 64 Possibile rischio per i bambini allattati al seno.
R 65 Può causare danni polmonari se ingerito

Combinazioni delle frasi R

- R 14/15 Reagisce violentemente con l'acqua liberando gas estremamente infiammabili.
R 15/21 A contatto con acqua libera gas tossici estremamente infiammabili.
R 20121 Nocivo per inalazione e contatto con la pelle.
R 20/22 Nocivo per inalazione e ingestione
R 20/21/22 Nocivo per inalazione, contatto con la pelle e per ingestione.
R 21/22 Nocivo a contatto con la pelle e per ingestione.
R 23/24 Tossico per inalazione e contatto con la pelle
R 23/25 Tossico per inalazione e ingestione.
R 23/24/25 Tossico per inalazione, contatto con la pelle e per ingestione
R 24/25 Tossico a contatto con la pelle e per ingestione.
R 26/27 Molto tossico per inalazione e contatto con la pelle
R 26/28 Molto tossico per inalazione e per ingestione.
R 26/27/28 Molto tossico per inalazione, contatto con la pelle e per ingestione.
R 27/28 Molto tossico a contatto con la pelle e per ingestione.
R 36/37 Irritante per gli occhi e le vie respiratorie.
R 36/38 Irritante per gli occhi e la pelle.
R 36/37/38 Irritante per gli occhi, le vie respiratorie e la pelle.
R 37/38 Irritante per le vie respiratorie e la pelle.
R 39/23 Tossico: pericolo di effetti irreversibili molto gravi per inalazione.
R 39/24 Tossico: pericolo di effetti irreversibili molto gravi a contatto con la pelle.
R 39/25 Tossico: pericolo di effetti irreversibili molto gravi per ingestione.
R 39/23/24 Tossico: pericolo di effetti irreversibili molto gravi per inalazione e a contatto con la pelle.
R 39/23/25 Tossico: pericolo di effetti irreversibili molto gravi per inalazione ed ingestione.

R 39/24/25	Tossico pericolo di effetti irreversibili molto gravi a contatto con la pelle e per ingestione.
R 39/23/24/25	Tossico pericolo di effetti irreversibili molto gravi per inalazione, a contatto con la pelle e per ingestione
R 39/26	Molto tossico: pericolo di effetti irreversibili molto gravi per inalazione.
R 39/27	Molto tossico pericolo di effetti irreversibili molto gravi a contatto con la pelle.
R 39/28	Molto tossico pericolo di effetti irreversibili molto gravi per ingestione.
R 39/26/27	Molto tossico pericolo di effetti irreversibili molto gravi per inalazione e a contatto con la pelle.
R 39/26/28	Molto tossico pericolo di effetti irreversibili molto gravi per inalazione ed ingestione.
R 39/27/28	Molto tossico pericolo di effetti irreversibili molto gravi a contatto con la pelle e per inalazione.
R 39/26/27/28	Molto tossico pericolo di effetti irreversibili molto gravi per inalazione, contatto con la pelle e per ingestione.
R 40/20	Nocivo: possibilità di effetti irreversibili per inalazione.
R 40/21	Nocivo: possibilità di effetti irreversibili a contatto con la pelle,
R 40/22	Nocivo: possibilità di effetti irreversibili per ingestione.
R 40/20/21	Nocivo: possibilità di effetti irreversibili inalazione e a contatto con la pelle.
R 40/20/22	Nocivo: possibilità di effetti irreversibili per inalazione ed ingestione.
R 40/21/22	Nocivo: possibilità di effetti irreversibili a contatto con la pelle e per ingestione.
R 40/20/21/22	Nocivo: possibilità di effetti irreversibili per inalazione, a contatto con la pelle e per ingestione.
R 42/43	Può provocare sensibilizzazione per inalazione e contatto con la pelle.
R 48/20	Nocivo: pericolo di gravi danni per la salute in caso di esposizione prolungata per inalazione.
R 48/21	Nocivo: pericolo di gravi danni alla salute in caso di esposizione prolungata a contatto con la pelle.
R 48/22	Nocivo: pericolo di gravi danni alla salute in caso di esposizione prolungata per ingestione.
R 48/20/21	Nocivo: pericolo di gravi danni alla salute in caso di esposizione prolungata per inalazione e a contatto con la pelle
R 48/20/22	Nocivo: pericolo di gravi danni alla salute in caso di esposizione prolungata per inalazione e ingestione.
R 48/21/22	Nocivo: pericolo di gravi danni alla salute in caso di esposizione prolungata a contatto con la pelle e per ingestione.
R 48/20/21/22	Nocivo: pericolo di gravi danni alla salute in caso di esposizione prolungata per inalazione, a contatto con la pelle e per ingestione.
R 48/23	Tossico: pericolo di gravi danni alla salute in caso di esposizione prolungata per inalazione.
R 48/24	Tossico: pericolo di gravi danni alla salute in caso di esposizione prolungata a contatto con la pelle.
R 48/25	Tossico: pericolo di gravi danni alla salute in caso di esposizione prolungata per ingestione.
R 48/23/24	Tossico: pericolo di gravi danni alla salute in caso di esposizione prolungata per inalazione e a contatto con la pelle.

- R 48/23/25** Tossico: pericolo di gravi danni alla salute in caso di esposizione prolungata per inalazione ed ingestione.
- R 48/24/25** Tossico: pericolo di gravi danni alla salute in caso di esposizione prolungata a contatto con la pelle e per ingestione.
- R 48/23/24/25** Tossico: pericolo di gravi danni alla salute in caso di esposizione prolungata per inalazione, a contatto con la pelle e per ingestione.
- R 50/53** Altamente tossico per gli organismi acquatici, può provocare a lungo termine effetti negativi per l'ambiente acquatico.
- R 51/53** Tossico per gli organismi acquatici, può provocare a lungo termine effetti negativi per l'ambiente acquatico.
- R 52/53** Nocivo per gli organismi acquatici, può provocare a lungo termine effetti negativi per l'ambiente acquatico.

ALLEGATO IV

Elenco dei consigli di prudenza

- S 1 Conservare sotto chiave
- S 2 Conservare fuori della portata dei bambini
- S 3 Conservare in luogo fresco
- S 4 Conservare lontano da locali di abitazione
- S 5 Conservare sotto (liquido appropriato da indicarsi da parte del fabbricante)
- S 8 Conservare sotto (gas inerte da indicarsi da parte del fabbricante)
- S 7 Conservare il recipiente ben chiuso
- S 8 Conservare al riparo dall'umidità
- S 9 Conservare il recipiente in luogo ben ventilato
- S 12 Non chiudere ermeticamente il recipiente
- S 13 Conservare lontano da alimenti o mangimi e da bevande
- S 14 Conservare lontano da (sostanze incompatibili da precisare da parte del produttore)
- S 15 Conservare lontano dal calore
- S 18 Conservare lontano da fiamme e scintille-Non fumare
- S 17 Tenere lontano da sostanze combustibili
- S 18 Manipolare ed aprire il recipiente con cautela
- S 20 Non mangiare né bere durante l'impiego
- S 21 Non fumare durante l'impiego
- S 22 Non respirare le polveri
- S 23 Non respirare i gas/fumi/vapori/aerosoli/[termine(i) appropriato(i) da precisare da parte del produttore]
- S 24 Evitare il contatto con la pelle
- S 25 Evitare il contatto con gli occhi
- S 26 In caso di contatto con gli occhi, lavare immediatamente e abbondantemente con acqua e consultare un medico
- S 27 Togliersi di dosso immediatamente gli indumenti contaminati
- S 28 In caso di contatto con la pelle lavarsi immediatamente ed abbondantemente con (prodotti idonei da indicarsi da parte del fabbricante)
- S 29 Non gettare i residui nelle fognature
- S 30 Non versare acqua sul prodotto
- S 33 Evitare l'accumulo di cariche elettrostatiche
- S 35 Non disfarsi del prodotto e del recipiente se non con le dovute precauzioni
- S 36 Usare indumenti protettivi adatti
- S 37 Usare guanti adatti.
- S 38 In caso di ventilazione insufficiente, usare un apparecchio respiratorio adatto.
- S 39 Proteggersi gli occhi/la faccia.
- S 40 Per pulire il pavimento e gli oggetti contaminati da questo prodotto, usare.....(da precisare da parte del produttore).
- S 41 In caso di incendio e/o esplosione non respirare i fumi.
- S 42 Durante le fumigazioni/polimerizzazioni usare un apparecchio respiratorio adatto [termine(i) appropriato(i) da precisare da parte del produttore].
- S 43 In caso di incendio usare ..(mezzi estinguenti idonei da indicarsi da parte del fabbricante. Se l'acqua aumenta il rischio precisare "Non usare acqua".

- S 44 In caso di incidente o di malessere consultare immediatamente il medico (se possibile mostrargli etichetta).
- S 46 In caso d'ingestione consultare immediatamente il medico e mostrargli il contenitore o l'etichetta.
- S 47 Conservare a temperatura non superiore a °C (da precisare da parte del fabbricante).
- S 48 Mantenere umido con (mezzo appropriato da precisare da parte del fabbricante).
- S 49 Conservare soltanto nel recipiente originale.
- S 50 Non mescolare con..... (da specificare da parte del fabbricante).
- S 51 Usare soltanto in luogo ben ventilato.
- S 52 Non utilizzare su grandi superfici in locali abitati.
- S 53 Evitare l'esposizione-procurarsi speciali istruzioni prima dell'uso.
- S 56 Smaltire questo materiale e relativi contenitori in un punto di raccolta rifiuti pericolosi o speciali autorizzato.
- S 57 Usare contenitori adeguati per evitare l'inquinamento ambientale.
- S 59 Richiedere informazioni al produttore/fornitore per il recupero/riciclaggio.
- S 60 Questo materiale e il suo contenitore devono essere smaltiti come rifiuti pericolosi.
- S 61 Non disperdere nell'ambiente. Riferirsi alle istruzioni speciali schede informative in materia di sicurezza.
- S 62 Non provocare il vomito: consultare immediatamente il medico e mostrargli il contenitore o l'etichetta.

Combinazioni delle frasi S

- S 1/2 Conservare sotto chiave e fuori della portata dei bambini.
- S 3/7 Tenere il recipiente ben chiuso in luogo fresco.
- S 3/9/14 Conservare in luogo fresco e ben ventilato lontano da ... (materiali incompatibili da precisare da parte del fabbricante).
- S 3/9/14/49 Conservare soltanto nel contenitore originale in luogo fresco e ben ventilato lontano da ... (materiali incompatibili da precisare da parte del fabbricante).
- S 3/9/49 Conservare soltanto nel contenitore originale in luogo fresco e ben ventilato.
- S 3/14 Conservare in luogo fresco lontano da ... (materiali incompatibili da precisare da parte del fabbricante).
- S 7/8 Conservare il recipiente ben chiuso e al riparo dall'umidità.
- S 7/9 Tenere il recipiente ben chiuso e in luogo ben ventilato.
- S 7/47 Tenere il recipiente ben chiuso e a temperatura non superiore a ... °C (da precisare da parte del fabbricante).
- S 20/21 Non mangiare, né bere, né fumare durante l'impiego.
- S 24/25 Evitare il contatto con gli occhi e con la pelle.
- S 29/56 Non gettare i residui nelle fognature.
- S 36/37 Usare indumenti protettivi e guanti adatti.
- S 36/37/39 Usare indumenti protettivi e guanti adatti e proteggersi gli occhi/la faccia.
- S 36/39 Usare indumenti protettivi adatti e proteggersi gli occhi/la faccia.
- S 37/39 Usare guanti adatti e proteggersi gli occhi/la faccia.
- S 47/49 Conservare soltanto nel contenitore originale a temperatura non superiore ada parte del fabbricante)

ALLEGATO V

CONTENUTO

INTRODUZIONE

PARTE A METODI PER LA DETERMINAZIONE DELLE PROPRIETA' FISICO-CHIMICHE

- A 1 Temperatura di fusione/congelamento
- A 2 Temperatura di ebollizione
- A 3 Densità relativa
- A 4 Tensione di vapore
- A 5 Tensione superficiale
- A 6 Idrosolubilità
- A 8 Coefficiente di ripartizione
- A 9 Punto d'infiammabilità
- A 10 Infiammabilità (solidi)
- A 11 Infiammabilità (gas)
- A 12 Infiammabilità (contatto con l'acqua)
- A 13 Proprietà pirolitiche di solidi e liquidi
- A 14 Proprietà esplosive
- A 15 Temperatura di autoaccensione (liquidi e gas)
- A 16 Temperatura di autoaccensione relativa dei solidi
- A 17 Proprietà ossidanti (solidi)

PARTE B METODI PER LA DETERMINAZIONE DELLA TOSSICITA'

Introduzione generale

- B 1 Tossicità acuta per via orale
- B 1 bis Tossicità acuta (per via orale) metodo a dose fissa
- B 1 ins Tossicità acuta per via orale Metodo della classe di tossicità acuta
- B 2 Tossicità acuta per inalazione
- B 3 Tossicità acuta per via cutanea
- B 4 Tossicità acuta (irritazione cutanea)
- B 5 Tossicità acuta (irritazione oculare)
- B 6 Sensibilizzazione cutanea
- B 7 Tossicità a dose ripetuta (28 giorni) per via orale
- B 8 Tossicità a dose ripetuta (28 giorni) per inalazione
- B 9 Tossicità a dose ripetuta (28 giorni) per via cutanea
- B 10 Mutagenicità (mammiferi saggio citogenetico in vitro)
- B 11 Mutagenicità (mammiferi midollo osseo saggio citogenetico *in vivo* analisi cromosomica)
- B 12 Mutagenicità (saggio del micronucleo)
- B 13 Mutagenicità (batteri *Escherichia coli* - saggio di reversione)
- B 14 Mutagenicità (*Salmonella typhimurium* - saggio di reversione)

- B. 15. Mutazione genica: *Saccharomyces cerevisiae*
- B. 16. Ricombinazione mitotica: *Saccharomyces cerevisiae*
- B. 17. Cellule di mammiferi in vitro: saggio di mutazione genica
- B. 18. Danno e riparazione del DNA: sintesi non programmata del DNA e cellule di mammifero in vitro
- B. 19. Saggio degli scambi tra cromatidi fratelli in vitro
- B. 20. Saggio dei letali recessivi legati al sesso: *Drosophila melanogaster*
- B. 21. Saggio in vitro di trasformazione di cellulose di mammifero in vitro
- B. 22. Saggio dei letali dominanti nei roditori
- B. 23. Analisi citogenetica delle cellule germinali: mammiferi
- B. 24. Saggio delle macchie (spot test): topi
- B. 25. Traslocazioni ereditabili: topo
- B. 26. Saggio di tossicità orale subcronica: saggio di somministrazione orale ripetuta di dosi per 90 giorni usando specie di roditori
- B. 27. Saggio di tossicità orale subcronica: saggio di somministrazione orale ripetuta di dosi per 90 giorni usando specie di non roditori
- B. 28. Saggio di tossicità cutanea subcronica: saggio di somministrazione cutanea ripetuta di dosi per 90 giorni usando specie non di roditori
- B. 29. Saggio di tossicità subcronica inalatoria: saggio di somministrazione inalatoria ripetuta di dosi per 90 giorni usando specie di non roditori
- B. 30. Saggio di tossicità cronica
- B. 31. Saggio di teratogenesi: roditori e non roditori
- B. 32. Saggio di cancerogenesi
- B. 33. Saggio combinato di tossicità cronica/ cancerogenesi
- B. 34. Saggio di tossicità sulla riproduzione: una generazione
- B. 35. Saggio di tossicità sulla riproduzione: due generazioni
- B. 36. Tossicocinetica
- B. 37. Neurotossicità ritardata di sostanze organofosforiche dopo esposizione acuta
- B. 38. Neurotossicità ritardata di sostanze organofosforiche con somministrazione ripetuta per 28 giorni

PARTE C: Metodi per la determinazione della ecotossicità

Introduzione generale: parte C

- C. 1. Tossicità acuta per i pesci
- C. 2. Tossicità acuta per le *Daphnia*
- C. 3. Saggio di inibizione della crescita delle alghe
- C. 4. Degradazione biologica: determinazione della <pronta> biodegradabilità
 - C. 4-A Carbonio organico disciolto (DOC) spazzione lenta
 - C. 4-B Saggio di Screening OCSE modificato
 - C. 4-C Sviluppo di biossido di carbonio (CO₂)
 - C. 4-D Respirimetria manometrica
 - C. 4-E Bottiglia chiusa
 - C. 4-F MITI (Ministero del Commercio Internazionale e dell'Industria - Giappone)
- C. 5. Degradazione: domanda biochimica di ossigeno (BOD)
- C. 6. Degradazione: domanda chimica di ossigeno (COD)
- C. 7. Degradazione: degradazione abiotica idrolisi in funzione del pH
- C. 8. Tossicità per lombrichi: saggio su terreno artificiale

-
- | | |

| C 10 | Biodegradazione saggio di simulazione con fanghi attivi |
| C 11 | Biodegradazione fanghi attivi saggio di inibizione della respirazione |
| C 12 | Biodegradazione saggio SCAS modificato |

INTRODUZIONE

L'allegato presenta dei metodi di prova per la determinazione delle proprietà chimico-fisiche, tossicologiche e ecotossicologiche elencate negli allegati VII e VIII —————. I metodi sono basati su quelli riconosciuti e raccomandati da organismi internazionali competenti (in particolare l'OCSE).

Nei casi in cui non sono disponibili tali metodi, sono stati adottati norme nazionali o metodi che godono di consenso a livello scientifico. In generale le prove devono essere eseguite con la sostanza come definito dalla direttiva. Si deve porre attenzione alla possibile influenza di impurezze sui risultati delle prove.

Nel caso in cui i metodi di questo allegato siano inappropriati per lo studio di una certa proprietà, il notificante deve giustificare il metodo alternativo utilizzato.

Prove e studi su animali saranno condotti secondo i regolamenti nazionali e dovranno tener conto di principi umani e sviluppi internazionali nel campo del benessere degli animali.

Tra metodi di prova equivalenti, si sceglie il metodo che utilizza il numero minimo di animali.

PARTE A: METODI PER LA DETERMINAZIONE DELLE PROPRIETÀ FISICO-CHIMICHE

A.1. TEMPERATURA DI FUSIONE/CONGELAMENTO

1. METODO

La maggior parte dei metodi descritti si basano sulle linee direttrici OCSE (1). I principi fondamentali sono riportati nei riferimenti (2) e (3).

1.1. INTRODUZIONE

I metodi e le apparecchiature qui illustrati si applicano alla determinazione della temperatura di fusione di sostanze senza alcuna limitazione rispetto al loro grado di purezza.

La scelta del metodo più idoneo dipende dalla natura delle sostanze in esame. Di conseguenza, il fattore limitante sarà inerente al fatto che la sostanza sia facilmente, difficilmente o per nulla polverizzabile.

Per alcune sostanze, la determinazione della temperatura di congelamento o di solidificazione risulta più appropriata e pertanto in questo metodo sono state incluse anche le norme per queste determinazioni.

Dove, a motivo delle particolari proprietà della sostanza, non sia possibile misurare in modo adatto alcuni dei parametri suddetti, può essere appropriato un punto di scorrimento.

1.2. DEFINIZIONI E UNITÀ

La temperatura di fusione è definita come la temperatura alla quale si verifica la transizione di fase dallo stato solido allo stato liquido a pressione atmosferica, e questa temperatura nel caso ideale corrisponde alla temperatura di congelamento.

Poiché per molte sostanze la transizione di fase si verifica in un intervallo di temperatura ampio, questo viene spesso descritto come intervallo di fusione.

Conversione delle unità (da K a °C):

$$t = T - 273,15$$

t: temperatura Celsius, gradi Celsius (°C)

T: temperatura termodinamica, kelvin (K)

1.3. SOSTANZE DI RIFERIMENTO

Non è necessario utilizzare sostanze di riferimento ogni volta che si esamina una nuova sostanza. Esse devono principalmente venire impiegate per controllare periodicamente i risultati ottenuti col metodo e per permettere confronti con i risultati ottenuti con altri metodi.

Alcune sostanze di riferimento sono elencate nel riferimento bibliografico (4).

1.4. PRINCIPIO DEL METODO

Si determina la temperatura (o l'intervallo di temperatura) della transizione di fase dallo stato solido allo stato liquido o dallo stato liquido allo stato solido. In pratica si determina la temperatura di fusione/congelamento incipiente e di fusione/congelamento finale durante il riscaldamento/raffreddamento di un campione della sostanza in esame a pressione atmosferica. Sono descritti 5 metodi, e precisamente il metodo del capillare, il metodo degli elementi riscaldanti, la determinazione del punto di congelamento, i metodi di analisi termica e la determinazione del punto di scorrimento (come è stata sviluppata per gli olii di origine petrolifera).

In alcuni casi, può essere conveniente misurare la temperatura di congelamento invece della temperatura di fusione.

1.4.1. Metodo del capillare

1.4.1.1. Apparecchi per la determinazione del punto di fusione tramite bagno liquido

Una piccola quantità della sostanza finemente macinata viene introdotta in un tubo capillare e compattata fortemente. Il tubo viene riscaldato, insieme ad un termometro, e l'aumento di temperatura viene regolato in modo che sia inferiore a circa 1 K/min durante la fusione propriamente detta. Si determinano quindi le temperature iniziale e finale di fusione.

1.4.1.2. Apparecchi per la determinazione del punto di fusione a blocco metallico

Si procede come indicato al punto 1.4.1.1, salvo il fatto che il tubo capillare ed il termometro sono collocati in un blocco di metallo riscaldante, attraverso alcuni fori del quale è possibile la loro osservazione.

1.4.1.3. Determinazione tramite fotocellula

Il campione contenuto nel tubo capillare viene riscaldato automaticamente in un cilindro metallico. Attraverso un foro praticato nel cilindro un raggio luminoso viene convogliato sulla sostanza e raggiunge poi una fotocellula accuratamente tarata. Per la maggior parte delle sostanze le proprietà ottiche si modificano durante la fusione, passando dall'opacità alla trasparenza. L'intensità della luce che raggiunge la fotocellula aumenta fino ad inviare un segnale di arresto all'indicatore numerico di un termometro a resistenza di platino collocato nella camera di riscaldamento. Questo metodo non è adatto per alcune sostanze fortemente colorate.

1.4.2. Elementi riscaldanti

1.4.2.1. Banco riscaldante di Kofler

Il banco riscaldante di Kofler fa uso di due corpi metallici di diversa conducibilità termica, riscaldati elettricamente; la sbarra è progettata in modo tale che per tutta la sua lunghezza il gradiente di temperatura è virtualmente costante. La temperatura dell'elemento riscaldante può variare da 283 K a 573 K; essa viene letta su un apposito strumento costituito da un cursore provvisto di indice e di linguetta specificamente realizzati per ogni banco. Per determinare una temperatura di fusione, la sostanza viene distribuita in uno strato sottile direttamente sulla superficie dell'elemento riscaldante. In pochi secondi appare una linea di separazione netta tra la fase solida e quella liquida. La temperatura corrispondente a questa linea di separazione viene letta facendovi coincidere l'indice dello strumento.

1.4.2.2. Microscopio di fusione

Numerosi sono gli elementi riscaldanti forniti di microscopio utilizzati per la determinazione del punto di fusione con quantità molto piccole di materiale. Nella maggioranza di questi strumenti, la temperatura viene determinata mediante una termocoppia sensibile, ma talvolta si usano anche termometri a mercurio. La versione tipica di un apparecchio per la determinazione del punto di fusione ad elemento riscaldante con microscopio è dotata di una camera di riscaldamento contenente una piastra metallica sopra la quale si pone il campione, distribuito su un vetrino. Al centro della piastra metallica si trova un foro che permette il passaggio della luce proveniente dallo specchio di illuminazione del microscopio. Durante la misura la camera viene chiusa da una piastra di vetro in modo da escludere l'aria dalla zona del campione.

Il riscaldamento del campione è regolato da un reostato. Per misure di grande precisione e nel caso di sostanze otticamente anisotrope, si può utilizzare luce polarizzata.

1.4.2.3. Metodo del menisco

Questo metodo è specifico per le poliammidi.

Si determina visivamente la temperatura alla quale si verifica lo spostamento di un menisco di olio silconico compreso tra un elemento riscaldante e un copri-oggetti sostenuto dal campione di poliammide in esame.

1.4.3. Metodo per determinare la temperatura di congelamento

Il campione viene posto in una provetta speciale e inserito in un apparecchio per la determinazione della temperatura di congelamento. Il campione viene agitato con delicatezza e continuità durante il raffreddamento.

e la temperatura viene misurata ad intervalli adatti. Non appena la temperatura si mantiene costante per qualche lettura, si registra tale temperatura (corretta per l'errore termometrico) come temperatura di congelamento.

Si deve evitare un sovraraffreddamento mantenendo l'equilibrio tra le fasi solida e liquida.

1.4.4. Analisi termica

1.4.4.1. Analisi termica differenziale (ATD)

Questa tecnica registra la differenza di temperatura tra la sostanza e un materiale di riferimento in funzione della temperatura stessa mentre la sostanza e il materiale di riferimento sono sottoposti allo stesso programma controllato di temperatura. Quando il campione subisce una transizione che implica una variazione di entalpia, tale variazione è indicata da una deviazione endotermica (fusione) o esotermica (congelamento) dalla linea di base del tracciato della temperatura.

1.4.4.2. Calorimetria differenziale a scansione (CDS)

Questa tecnica registra la differenza tra l'energia introdotta in una sostanza e quella introdotta in un materiale di riferimento, in funzione della temperatura, mentre la sostanza e il materiale di riferimento sono sottoposti allo stesso programma controllato di temperatura. Questa energia è l'energia necessaria per mantenere nulla la differenza di temperatura tra la sostanza e il materiale di riferimento. Quando il campione subisce una transizione che implica una variazione di entalpia, tale variazione è indicata da una deviazione endotermica (fusione) o esotermica (congelamento) dalla linea di base del tracciato del flusso termico.

1.4.5. Punto di scorrimento

Questo metodo è stato sviluppato per l'uso con gli oli di origine petrolifera ed è adatto per l'uso con sostanze oleose aventi una bassa temperatura di fusione.

Dopo un riscaldamento preliminare, il campione viene raffreddato ad una velocità specifica mentre, ad intervalli di 3 K, se ne esaminano le caratteristiche di scorrimento. La temperatura più bassa alla quale si osserva un movimento della sostanza viene registrata come punto di scorrimento.

1.5. CRITERI DI QUALITÀ

L'applicabilità e l'accuratezza dei vari metodi impiegati per la determinazione della temperatura di fusione/intervallo di fusione sono indicate nella seguente tabella.

TABELLA: APPLICABILITÀ DEI METODI

A. Metodi con impiego di capillare

Metodo di misura	Sostanze polverizzabili	Sostanze difficilmente polverizzabili	Intervallo di temperatura	Accuratezza stimata ⁽¹⁾	Norme esistenti
Apparecchi per il punto di fusione a bagno liquido	Si	Soltanto per alcune	Da 273 a 573 K	± 0,3 K	JIS K 0064
Apparecchi per il punto di fusione con blocco metallico	Si	Soltanto per alcune	Da 293 a > 573 K	± 0,5 K	ISO 1218 (E)
Determinazione con fotocellula	Si	Svariate, con uso di accessori	Da 253 a 573 K	± 0,5 K

1.6 DESCRIZIONE DEI METODI

Le procedure relative a quasi tutti i metodi di determinazione sono state descritte in varie norme internazionali e nazionali (vedi appendice 1)

1.6.1 Metodi con tubo capillare

Quando vengono sottoposte ad un lento aumento di temperatura, sostanze finemente polverizzate mostrano solitamente gli stadi di fusione mostrati in figura 1

Figura 1

- Stadio A** (inizio della fusione): minuscole goccioline aderiscono uniformemente alla parete interna del capillare;
- Stadio B:** in seguito alla contrazione del fuso, va evidenziandosi uno spazio libero tra il campione e la parete interna;
- Stadio C:** dopo essersi contratto, il campione inizia a scivolare in basso ed a liquefarsi;
- Stadio D:** si ha la formazione di un menisco completo alla superficie, ma una quantità apprezzabile del campione rimane solida;
- Stadio E** (stadio finale della fusione): non restano più particelle solide.

Durante la determinazione della temperatura di fusione viene registrata la temperatura all'inizio della fusione e nello stadio finale.

1.6.1.1. Apparecchi per il punto di fusione a bagno liquido

La figura 2 presenta un tipo di apparecchio normalizzato, realizzato in vetro, per la temperatura di fusione (JIS K0064): tutte le quote sono date in mm.

Figura 2

- A: Recipiente di misura
 B: Tappo di sughero
 C: Sfogo
 D: Termometro
 E: Termometro ausiliario
 F: Bagno liquido
 G: Tubo capillare in vetro: lunghezza da 80 a 100 mm ; diametro interno $1 \pm 0,2$ mm ; spessore da 0,2 a 0,3 mm
 H: Tubo laterale

Bagno liquido:

Si deve scegliere un liquido adatto. La scelta del liquido dipende dalla temperatura di fusione da determinare, per esempio paraffina liquida per temperature di fusione non superiori a 473 K, olio di silicone per temperature di fusione non maggiori di 573 K.

Per temperature di fusione superiori a 523 K, si può usare una miscela costituita da 3 parti di acido solforico e 2 parti di solfato di potassio (rapporto in peso). Se si usa una miscela di questo tipo occorre prendere opportune precauzioni.

Termometro:

Vanno impiegati soltanto termometri che soddisfano le prescrizioni delle norme ASTM E 1-71, DIN 12770, JIS K 8001, o di norme equivalenti.

ASTM E 1671, DIN 12770, JIS K 8001.

Modalità operative:

La sostanza secca va polverizzata finemente in un mortaio e posta in un tubo capillare, chiuso per fusione ad una estremità, in modo che, dopo assestamento nella maniera più compatta possibile, l'altezza del riempimento sia di 3 mm circa. Per ottenere un assestamento uniforme del campione, il tubo capillare deve essere lasciato cadere attraverso una canna di vetro su un vetro da orologio da un'altezza di circa 700 mm.

Il capillare riempito viene posto nel bagno in modo tale che la parte centrale del bulbo del termometro a mercurio sia in contatto con il tubo capillare nella zona dove è collocato il campione. Il tubo capillare viene di solito introdotto nell'apparecchio a temperatura inferiore di circa 10 K a quella della temperatura di fusione.

Il bagno liquido viene riscaldato in modo che l'aumento di temperatura corrisponda a circa 3 K/min. Il liquido va mantenuto sotto agitazione. A circa 10 K al di sotto della temperatura prevista di fusione, la velocità di incremento della temperatura va regolata ad un massimo di 1 K/min.

Calcolo:

La temperatura fusione si calcola con la formula seguente:

$$T = T_D + 0,00016 (T_D - T_E)n$$

dove:

T = temperatura di fusione corretta, in K,

T_D = temperatura letta sul termometro D, in K,

T_E = temperatura letta sul termometro E, in K,

n = numero di graduazioni della colonnina di mercurio sul termometro D sulla parte di stelo emergente.

1.6.1.2. Apparecchi per la temperatura di fusione con blocco metallico*Apparecchiatura:*

La strumentazione consiste in:

- un blocco cilindrico di metallo, la cui parte superiore è cava e forma una camera (vedi figura 3);
- un tappo metallico provvisto di due o più fori per permettere l'inserimento dei tubi capillari nel blocco metallico;
- un sistema di riscaldamento per il blocco metallico realizzato, per esempio, tramite una resistenza elettrica incorporata nel blocco;
- un reostato per la regolazione della potenza applicata, se si fa uso del riscaldamento elettrico;
- quattro finestre di vetro resistente al calore sulle pareti laterali della camera, disposte diametralmente ad angolo retto l'una rispetto all'altra. Di fronte ad una di esse è montato un oculare per l'osservazione del capillare. Le altre tre finestre vengono usate per illuminare l'interno per mezzo di lampade;
- un capillare di vetro resistente al calore chiuso ad una estremità (vedi punto 1.6.1.1).

Termometro

Vedi norme citate al punto 1.6.1.1. Possono utilizzarsi anche strumenti di misura termoelettrici di analoga accuratezza

Figura 3

**1.6.1.3. Determinazione tramite fotocellula****Apparecchiatura e modalità operative**

La strumentazione consiste in una camera metallica con un sistema automatico di riscaldamento. Si riempiono tre capillari secondo le indicazioni del punto 1.6.1.1 e si pongono nella camera

Per la taratura dell'apparecchio sono disponibili diverse velocità di incremento lineare della temperatura e l'aumento di temperatura opportuno viene regolato elettricamente su una velocità costante e lineare preselezionata. La temperatura effettiva nel forno e la temperatura della sostanza nei tubi capillari sono indicate da registratori.

1.6.2 Elementi riscaldanti**1 6 2 1 Banco riscaldante di Kofler**

Vedi appendice.

1 6.2.2. Microscopio di fusione

Vedi appendice.

1.6.2.3 Metodo del menisco (per poliammidi)

Vedi appendice.

La velocità di riscaldamento nella zona di passaggio attraverso la temperatura di fusione deve essere inferiore a 1 K/min.

1.6.3. Metodi per la determinazione della temperatura di congelamento

Vedi appendice

1.6 4 Analisi termica**1.6 4.1 Analisi termica differenziale**

Vedi appendice.

1 6 4.2. Calorimetria differenziale a scansione

Vedi appendice

1.6.5. Determinazione del punto di scorrimento

Vedi appendice

2 DATI

In alcuni casi si rende necessaria una correzione della lettura termometrica

3 RELAZIONE

La relazione sulla prova deve, se possibile, includere le seguenti informazioni:

- metodo utilizzato;
- descrizione precisa della sostanza (identità e impurezze) ed eventuale stadio preliminare di purificazione,
- stima dell'accuratezza.

Come temperatura di fusione viene riportata la media di almeno due misure che cadano nel campo di accuratezza stimata (vedi tabelle)

Se la differenza tra la temperatura all'inizio e allo stadio finale della fusione ricade nei limiti di accuratezza del metodo, si prende come punto di fusione la temperatura dello stadio finale della fusione, altrimenti vengono riportate ambedue le temperature

Se la sostanza si decompone o sublima prima del raggiungimento della temperatura di fusione, si riporterà la temperatura alla quale si osserva l'effetto

Devono essere riportate tutte le informazioni e osservazioni utili per l'interpretazione dei risultati, in particolare per quanto riguarda le impurezze e lo stato fisico della sostanza

A.2. TEMPERATURA DI EBOLLIZIONE

1 METODO

La maggior parte dei metodi descritti sono basati sulle linee direttrici OCSE (1). I principi fondamentali sono riportati nei riferimenti (2) e (3).

1.1 INTRODUZIONE

I metodi e le apparecchiature qui illustrati possono essere applicati a sostanze liquide e a bassa temperatura di fusione, purché queste non siano soggette a reazioni chimiche al di sotto della temperatura di ebollizione (per esempio, autoossidazione, trasposizione, degradazione, ecc.). I metodi possono essere applicati a sostanze liquide sia pure che impure.

Si dà particolare risalto ai metodi che utilizzano la determinazione tramite fotocellula e l'analisi termica perché questi metodi permettono la determinazione sia della temperatura di fusione che della temperatura di ebollizione. Inoltre, le misure possono essere eseguite in automatico.

Il «metodo dinamico» ha il vantaggio di poter essere applicato anche alla determinazione della tensione di vapore e di non richiedere la correzione della temperatura di ebollizione per riferirla alla pressione normale (101,325 kPa) dal momento che la pressione normale può essere regolata durante la misura mediante un manostato.

Osservazioni

L'influenza delle impurezze sulla determinazione della temperatura di ebollizione dipende in notevole misura dalla natura delle impurezze. Quando il campione contiene impurezze volatili che possono alterare i risultati, la sostanza può venire purificata.

1.2 DEFINIZIONI E UNITÀ

La temperatura di ebollizione normale è definita come la temperatura alla quale la tensione di vapore di un liquido è di 101,325 kPa.

Se la temperatura di ebollizione non viene misurata alla pressione atmosferica normale, la dipendenza della tensione di vapore dalla temperatura può essere descritta mediante l'equazione di Clausius Clapeyron

$$\log p = \frac{\Delta H_v}{2,3 RT} + \text{cost}$$

dove

p = tensione di vapore della sostanza in Pascal,

ΔH_v = calore di evaporazione in J mol^{-1} ,

R = costante universale dei gas = $8,314 \text{ J mol}^{-1} \text{ K}^{-1}$

T = temperatura termodinamica in K.

La temperatura di ebollizione è riferita alla pressione ambiente al momento della misura.

Fattori di conversione

Pressione (unità: kPa)

100 kPa = 1 bar = 0,1 MPa
(«bar» è ancora ammissibile, ma non raccomandato)

133 Pa = 1 mm Hg = 1 Torr
(le unità «mm Hg» e «Torr» non sono permesse)

1 atm = atmosfera standard = 101,325 Pa
(l'unità «atm» non è permessa)

Temperatura (unità K)

$$t = T - 273,15$$

t temperatura Celsius, gradi Celsius (°C)

T temperatura termodinamica, Kelvin (K)

1.3 SOSTANZE DI RIFERIMENTO

Non è necessario utilizzare sostanze di riferimento in tutti i casi in cui si esamina una nuova sostanza. Esse servono principalmente per controllare periodicamente l'accuratezza del metodo e per permettere un confronto coi risultati ottenuti con altri metodi.

Alcune sostanze di riferimento sono elencate nei metodi riportati in appendice

1.4 PRINCIPIO DEI METODI

Cinque metodi per la determinazione della temperatura di ebollizione (intervallo di ebollizione) sono basati sulla misura della temperatura di ebollizione, altri due sono basati sull'analisi termica

1.4.1 Determinazione tramite ebulliometro

Gli ebulliometri sono stati originariamente concepiti per la determinazione del peso molecolare tramite l'innalzamento della temperatura di ebollizione, ma si prestano anche per accurate misure della temperatura di ebollizione. Una apparecchiatura molto semplice è descritta nella norma ASTM D 1120-72 (vedi appendice). Con questo strumento il liquido viene riscaldato fino all'ebollizione in condizioni di equilibrio a pressione atmosferica.

1.4.2 Metodo dinamico

Questo metodo implica la misura della temperatura di ricondensazione del vapore mediante un appropriato termometro nella zona di riflusso durante l'ebollizione. Questo metodo permette di variare la pressione.

1.4.3 Metodo della distillazione per la temperatura di ebollizione

Il metodo si basa sulla distillazione del liquido e sulla misura della temperatura di ricondensazione del vapore con determinazione della quantità di distillato.

1.4.4 Metodo di Siwoloboff

Il campione viene riscaldato in una provetta immersa a sua volta nel liquido di un bagno riscaldante. Nella provetta contenente il campione viene introdotto un capillare, chiuso per fusione ad un estremo e contenente una bollicina d'aria nella parte inferiore.

1.4.5 Determinazione tramite fotocellula

Si impiega il metodo Siwoloboff, applicando tuttavia la misura fotoelettrica della fase di emissione delle bollicine.

1.4.6 Analisi termica differenziale

Questa tecnica registra la differenza di temperatura tra la sostanza e un materiale di riferimento, in funzione della temperatura, mentre la sostanza e il materiale di riferimento sono sottoposti allo stesso programma controllato di variazione della temperatura. Quando il campione subisce una transizione che implica una variazione di entalpia, tale variazione è indicata da un allontanamento endotermico (ebollizione) dalla linea di base nella registrazione della temperatura.

1 4 7. Calorimetria differenziale a scansione

Questa tecnica registra la differenza di energia introdotta in una sostanza e in un materiale di riferimento in funzione della temperatura mentre la sostanza e il materiale di riferimento vengono sottoposti allo stesso programma controllato di variazione della temperatura. Questa energia è l'energia necessaria per mantenere a zero la differenza di temperatura tra la sostanza e il materiale di riferimento. Quando il campione subisce una transizione che implica una variazione di entalpia, tale variazione è indicata da un allontanamento endotermico (ebollizione) dalla linea di base della registrazione del flusso di calore.

1 5 CRITERI DI QUALITÀ

La tabella 1 riporta l'applicabilità e l'accuratezza dei vari metodi utilizzati per la determinazione della temperatura di ebollizione/intervallo di ebollizione.

TABELLA 1: CONFRONTO DEI METODI

Metodo di misura	Accuratezza stimata	Norme esistenti
Ebullimetro	$\pm 1,4$ K (fino a 373 K) ⁽¹⁾⁽²⁾ $\pm 2,5$ K (fino a 600 K) ⁽¹⁾⁽²⁾	ASTM D 1120-72 ⁽¹⁾
Metodo dinamico	$\pm 0,5$ K (fino a 600 K) ⁽²⁾	
Processo di distillazione (intervallo di ebollizione)	$\pm 0,5$ K (fino a 600 K)	ISO/R 918, DIN 53171 BS 4591/71
Metodo di Siwoloboff	± 2 K (fino a 600 K) ⁽²⁾	
Rivelazione mediante fotocellula	$\pm 0,3$ K (a 373 K) ⁽²⁾	
Analisi termica differenziale	$\pm 0,5$ K (fino a 600 K) $\pm 2,0$ K (fino a 1 273 K)	ASTM E 537-76
Calorimetria differenziale a scansione	$\pm 0,5$ K (fino a 600 K) $\pm 2,0$ K (fino a 1 273 K)	ASTM E 537-76
⁽¹⁾ Questo livello di accuratezza è valido soltanto nel caso di una strumentazione semplice, come ad esempio quella descritta nella norma ASTM D 1120-72, esso può essere migliorato con ebulliometri più perfezionati. ⁽²⁾ Valida solo per sostanze pure. L'uso in altre circostanze deve essere giustificato.		

1 6 DESCRIZIONE DEI METODI

I procedimenti relativi ad alcuni dei metodi citati sono descritti in varie norme internazionali e nazionali (vedi appendice).

1 6 1 Ebullimetro

Vedi appendice

1 6 2 Metodo dinamico

Vedi metodo A 4 per la determinazione della tensione di vapore.

Si assume come temperatura di ebollizione quella misurata in corrispondenza di una pressione di 101,325 kPa.

1 6 3 Metodo della distillazione (intervallo di ebollizione)

Vedi appendice

1 6 4

Metodo di Siwoloboff

Il campione viene riscaldato in una apparecchiatura per il punto di fusione in una provetta di diametro approssimato di 5 mm (figura 1)

La figura 1 presenta un tipo di apparecchiatura standardizzata per la determinazione della temperatura di fusione e di ebollizione (JIS K 0064) (realizzata in vetro, tutte le quote sono in mm)

Figura 1

- A Recipiente di misura
- B Tappo
- C Sfogo
- D Termometro
- E Termometro ausiliario
- F Bagno liquido
- G Provetta contenente il campione diametro esterno massimo 5 mm, contenente un tubo capillare di lunghezza di 100 mm circa, diametro interno di 1 mm circa e con spessore della parete da 0,2 a 0,3 mm
- H Tubo laterale

Nella provetta viene posto un tubo capillare (capillare di ebollizione) fuso a circa 1 cm dall'estremità inferiore. Il livello di riempimento della sostanza in esame deve essere tale che la parte fusa del capillare si trovi al di sotto della superficie del liquido. La provetta contenente il capillare di ebollizione può essere assicurata al termometro con un elastico oppure fissata tramite un sostegno laterale (vedi figura 2)

Figura 2

Principio secondo Siwoloboff

Figura 3

Principio modificato

Il liquido per il bagno va scelto in funzione della temperatura di ebollizione. Per temperature fino a 573 K si può impiegare olio di silicone. La paraffina liquida può essere impiegata solo fino a 473 K. Il riscaldamento del bagno liquido deve essere regolato in modo che l'incremento di temperatura sia inizialmente di circa 3 K/min. Il liquido del bagno va tenuto in agitazione. A circa 10 K al di sotto della temperatura di ebollizione prevista, il riscaldamento va diminuito in maniera da ridurre la velocità di aumento della temperatura a meno di 1 K/min. In prossimità della temperatura di ebollizione, dal capillare in ebollizione incominciano a emergere rapidamente delle bollicine.

La temperatura di ebollizione è la temperatura alla quale, per raffreddamento temporaneo, la serie di bollicine si arresta e il fluido inizia improvvisamente a risalire nel capillare. La corrispondente lettura termometrica rappresenta la temperatura di ebollizione della sostanza.

Secondo il principio modificato (vedi figura 3) la temperatura di ebollizione viene determinata in un capillare per la temperatura di fusione. Questo viene sfilato per circa 2 cm (a) e con esso si aspira una piccola quantità del campione. L'estremità aperta della parte sfilata viene chiusa alla fiamma in modo da far restare una bollicina d'aria in vicinanza della punta. Durante il riscaldamento nell'apparecchio per la temperatura di fusione (b) la bolla d'aria si dilata. La temperatura di ebollizione corrisponde alla temperatura alla quale il menisco superiore della sostanza raggiunge il livello della superficie del bagno liquido (c).

1.6.5 Determinazione tramite fotocellula

Il campione viene riscaldato in un tubicino capillare all'interno di un blocco metallico riscaldante.

Tramite opportune aperture sul blocco, un raggio di luce viene fatto passare attraverso la sostanza e colpisce una fotocellula accuratamente tarata.

Durante l'aumento della temperatura del campione, dal capillare di ebollizione emergono bollicine d'aria isolate. Quando viene raggiunta la temperatura di ebollizione, il numero di bollicine aumenta enormemente. Ciò fa variare l'intensità della luce misurata dalla fotocellula, inviando un segnale di arresto all'indice di un termometro a resistenza di platino collocato nel blocco.

Questo metodo risulta particolarmente vantaggioso poiché permette determinazioni al di sotto della temperatura ambiente fino a 253,15 K (-20 °C) senza modifiche dell'apparecchiatura. È semplicemente necessario porre lo strumento in un bagno di raffreddamento.

2 DATI

Per piccole deviazioni dalla pressione normale ($p_{\text{atm}} \pm 5 \text{ kPa}$), le temperature di ebollizione vengono normalizzate a T_n mediante la seguente equazione numerica di Sidney Young:

$$T_n = T + (t_1 \times \Delta p)$$

dove

$\Delta p = (101,325 - p)$ [notare il segno],

p = valore misurato della pressione, in kPa,

t_1 = coefficiente di correzione della temperatura di ebollizione con la pressione, in K/kPa,

T = valore misurato della temperatura, in K,

T_n = temperatura di ebollizione corretta a pressione normale, in K.

Per molte sostanze i coefficienti di correzione della temperatura f_T e le equazioni per il calcolo approssimativo sono indicati nelle norme internazionali e nazionali prima citate

A titolo di esempio, il metodo DIN 53171 cita i seguenti coefficienti approssimativi per i solventi contenuti nelle vernici

TABELLA 2: COEFFICIENTI DI CORREZIONE DELLA TEMPERATURA f_T

Temperatura T in K	Coefficiente di correzione f_T (K/kPa)
323,15	0,26
348,15	0,28
373,15	0,31
398,15	0,33
423,15	0,35
448,15	0,37
473,15	0,39
498,15	0,41
523,15	0,44
548,15	0,45
573,15	0,47

3 RELAZIONE

La relazione sulla prova deve, se possibile, includere le seguenti informazioni:

- metodo usato,
- descrizione precisa della sostanza (identità e impurezze) e dell'eventuale stadio preliminare di purificazione,
- una stima dell'accuratezza

Come temperatura di ebollizione viene riportata la media di almeno due misure che ricadano nel campo dell'accuratezza stimata (vedi tabella 1)

Devono essere riportate le temperature di ebollizione misurate e la loro media, e le pressioni alle quali sono state effettuate le misure devono essere riportate in kPa. La pressione deve preferibilmente essere prossima alla normale pressione atmosferica

Vanno fornite tutte le informazioni e osservazioni utili per l'interpretazione dei risultati, in particolare per quanto riguarda le impurezze e lo stato fisico della sostanza

A 3 DENSITÀ RELATIVA

1	METODO
	I metodi descritti si basano sulle linee direttrici (OCSE) (1). I principi fondamentali sono riportati nel riferimento (2).
1.1	INTRODUZIONI
	I metodi qui illustrati si applicano alle sostanze solide e liquide senza alcuna limitazione rispetto al loro grado di purezza.
	I vari metodi da utilizzare sono elencati nella tabella 1.
1.2	DEFINIZIONI ED UNITÀ
	La densità relativa, D_4^{20} , di solidi o liquidi è il rapporto tra la massa di un determinato volume della sostanza in esame, misurata a 20 °C, e la massa di un ugual volume di acqua, misurata a 4 °C. La densità relativa è una grandezza adimensionale.
	La densità, ρ , di una sostanza è il rapporto tra una determinata massa m e il volume corrispondente v .
	In unità SI la densità, ρ , viene espressa in kg/m^3 .
1.3	SOSTANZE DI RIFERIMENTO (1) (3)
	Non è necessario utilizzare sostanze di riferimento in tutti i casi in cui si esamina una nuova sostanza. Esse servono principalmente per controllare periodicamente l'accuratezza del metodo e per permettere un confronto con risultati ottenuti con altri metodi.
1.4	PRINCIPIO DEI METODI
	Si utilizzano quattro classi di metodi:

1 4 1 Metodi per galleggiamento

1 4 1 1 Idrometro (per sostanze liquide)

Determinazioni rapide e sufficientemente accurate della densità possono essere eseguite per mezzo di idrometri galleggianti, che permettono di dedurre la densità di un liquido dal grado di immersione desunto da una scala graduata

1 4 1 2 Bilancia idrostatica (per sostanze solide e liquide)

La differenza tra il peso di un campione in aria e quello in un liquido adatto (per esempio acqua) può essere utilizzata per determinare la densità

Nel caso dei solidi, la densità così misurata va considerata valida solo per il particolare campione in esame. Per la determinazione della densità dei liquidi, un corpo di volume V noto viene pesato prima in aria e poi nel liquido stesso

1 4 1 3 Metodo ad immersione di sfera (per sostanze liquide) (4)

In questo metodo la densità di un liquido viene determinata in base alla differenza tra i valori ottenuti pesando il liquido prima e dopo l'immersione di una sfera di volume noto nel liquido stesso

1 4 2 Metodi picnometrici

Per solidi o liquidi possono impiegarsi picnometri di varia forma e di volume noto. La densità si calcola in base alla differenza di peso tra il picnometro pieno e quello vuoto ed in base al suo volume noto

1 4 3 Picnometro di comparazione ad aria (per solidi)

La densità di un solido di forma qualsiasi può essere determinata a temperatura ambiente con il picnometro di comparazione a gas. Il volume di una sostanza viene misurato in aria o in un gas inerte all'interno di un cilindro tarato di volume variabile. Per il calcolo della densità va effettuata una misura di massa successivamente a quella di volume

1 4 4 Densimetro oscillante (5) (6) (7)

La densità di un liquido può essere determinata per mezzo di un densimetro oscillante. Un oscillatore meccanico costruito a forma di un tubo a U viene fatto vibrare alla frequenza di risonanza dell'oscillatore, che dipende dalla sua massa. L'introduzione di un campione modifica la frequenza di risonanza dell'oscillatore. L'apparecchio deve essere calibrato mediante due sostanze liquide di densità nota. Tali sostanze vanno preferibilmente selezionate in modo da coprire l'intervallo di densità in cui si effettuano le misure

1 5 CRITERI DI QUALITÀ

L'applicabilità dei vari metodi impiegati per la determinazione della densità relativa è indicata nella tabella

1 6 DESCRIZIONE DEI METODI

Nell'appendice sono riportate a titolo di esempio alcune delle norme da consultare per ulteriori dettagli tecnici

Le prove vanno eseguite a 20 °C effettuando almeno due misure

2 DATI

Vedi norme

3 RELAZIONE

La relazione sulla prova deve, se possibile, includere le seguenti informazioni:

- metodo usato,
- descrizione precisa della sostanza (identità e impurezze) e dell'eventuale stadio preliminare di purificazione,

La densità relativa D_4^{20} deve essere indicata secondo quanto prescritto al punto 1.2, insieme allo stato fisico della sostanza esaminata.

Vanno fornite tutte le informazioni ed osservazioni utili per l'interpretazione dei risultati, in modo particolare per quel che riguarda le impurezze e lo stato fisico della sostanza.

A.4. TENSIONE DI VAPORE

1 METODO

La maggior parte dei metodi descritti sono basati sulle linee direttrici OCSE (1). I principi fondamentali sono presentati nei riferimenti (2) e (3).

1.1 INTRODUZIONE

Per eseguire questa prova è utile avere informazioni preliminari sulla struttura, la temperatura di fusione e la temperatura di ebollizione della sostanza.

Non esiste un procedimento unico che sia applicabile a tutto l'intervallo dei valori di tensione di vapore. Si raccomanda pertanto di usare più di un metodo per la misura di tensione di vapore da $<10^{-4}$ Pa a 10^5 Pa.

Le impurezze influiscono normalmente sulla tensione di vapore, e in una misura che dipende ampiamente dal tipo di impurezza.

Nel caso in cui nel campione siano presenti impurezze volatili che potrebbero influire sul risultato, la sostanza può venire purificata. Può anche essere opportuno indicare la tensione di vapore del materiale tecnico.

Alcuni dei metodi qui descritti utilizzano apparecchiature con parti metalliche, di ciò si deve tenere conto quando si analizzano sostanze corrosive.

1.2 DEFINIZIONI ED UNITÀ

La tensione di vapore di una sostanza è definita come la pressione di saturazione al di sopra di un solido o di un liquido. All'equilibrio termodinamico, la tensione di vapore di una sostanza pura è funzione della sola temperatura.

L'unità SI di pressione da utilizzare è il Pascal (Pa).

Altre unità impiegate in passato sono elencate qui di seguito con i relativi fattori di conversione.

1 Torr (= 1 mm Hg) = $1,333 \times 10^2$ Pa

1 atmosfera = $1,013 \times 10^5$ Pa

1 bar = 10^5 Pa

L'unità SI di temperatura è il grado Kelvin (K).

La costante universale dei gas R è $8,314 \text{ J mol}^{-1} \text{ K}^{-1}$.

La dipendenza della tensione di vapore dalla temperatura è descritta dalla equazione di Clausius-Clapeyron

$$\log p = \frac{\Delta H_v}{2,3 RT} + \text{cost}$$

dove

p = tensione di vapore della sostanza in Pascal

ΔH_v = calore di evaporazione in J mol^{-1}

R = costante universale dei gas = $8,314 \text{ J mol}^{-1} \text{ K}^{-1}$

T = temperatura termodinamica in K

1.3 SOSTANZE DI RIFERIMENTO

Non è necessario utilizzare sostanze di riferimento in tutti i casi in cui si esamina una nuova sostanza. Esse servono principalmente per controllare periodicamente l'accuratezza del metodo e per permettere un confronto con i risultati ottenuti con altri metodi.

1.4 PRINCIPIO DEL METODO

Per la determinazione della tensione di vapore si propongono sette metodi, che possono essere applicati a diversi intervalli della tensione di vapore. Per ciascun metodo, la tensione di vapore viene determinata a varie temperature. In un intervallo di temperatura limitato, il logaritmo della tensione di vapore di una sostanza pura è funzione lineare del reciproco della temperatura.

1.4.1 Metodo dinamico

Il metodo dinamico prevede la misura della temperatura di ebollizione corrispondente ad una determinata pressione.

Intervallo di valori raccomandato

da 10^3 a 10^5 Pa

Questo metodo è stato raccomandato anche per la determinazione della temperatura di ebollizione normale, ed a questo fine esso è utilizzabile fino a 600 K.

1.4.2 Metodo statico

Tramite il processo statico si determina la tensione di vapore che si stabilisce ad una determinata temperatura in un sistema chiuso in equilibrio termodinamico.

Questo metodo si presta per sostanze solide e liquide ad una o più fasi.

Intervallo di valori raccomandato

da 10 Pa fino a 10^5 Pa

Questo metodo può venire utilizzato anche nel campo di 1×10^{-3} Pa purché si proceda con attenzione.

1.4.3 Isoteniscopeo

Questo metodo standardizzato è a sua volta un procedimento statico, ma non è generalmente utilizzabile per sistemi a più componenti. Ulteriori dettagli sono reperibili nel metodo ASTM D-2879-86.

Intervallo di valori raccomandato

da 100 Pa a 10^5 Pa

1.4.4 Metodo di effusione - bilancia a tensione di vapore

Si determina la quantità di sostanza che, nell'unità di tempo, abbandona una cella attraverso un'apertura di dimensioni note e sotto condizioni di vuoto in modo che il ritorno della sostanza nella cella sia trascurabile (per esempio, tramite determinazione dell'impulso trasmesso ad una bilancia sensibile da un getto di vapore, oppure misurando la perdita di peso).

Intervallo di valori raccomandato

da 10^{-3} Pa a 1 Pa

1 4 5 Metodo di effusione: per perdita di peso o per cattura del vaporizzato

Il metodo è basato sulla stima della massa della sostanza in esame che esce nell'unità di tempo da una cella di Knudsen (4) in forma di vapore, attraverso un micro-orificio, in condizioni di vuoto spinto. La massa di vapore effusa può essere ottenuta o determinando la perdita di massa della cella o condensando il vapore a bassa temperatura e determinando la quantità di sostanza volatilizzata mediante l'uso dell'analisi cromatografica. La tensione di vapore viene calcolata applicando la relazione di Hertz-Knudsen.

Intervallo di valori raccomandato.

da 10^{-3} a 1 Pa

1 4.6. Metodo di saturazione del gas

Una corrente di gas di trasporto inerte viene fatta passare sopra alla sostanza in modo tale che detto gas si saturi del vapore della sostanza stessa. La quantità di materiale trasportata da una quantità nota di gas di trasporto può essere misurata o mediante raccolta in una trappola adatta o mediante una tecnica analitica a flusso continuo. Questo valore viene poi usato per calcolare la tensione di vapore ad una data temperatura.

Intervallo di valori raccomandato

da 10^{-4} a 1 Pa

Questo metodo può venire usato anche nel campo da 1 a 10 Pa purché si proceda con attenzione.

1 4 7 Rotore

Nel manometro a rotore, l'elemento di misura effettivo è una pallina d'acciaio sospesa in un campo magnetico, che ruota ad alta velocità. La pressione del gas viene ricavata dal rallentamento della pallina d'acciaio, che dipende dalla pressione.

Intervallo di valori raccomandato

10^{-4} a 0,5 Pa

1 5 CRITERI DI QUALITÀ

Si confrontano i vari metodi per la determinazione della tensione di vapore per quanto riguarda la loro applicabilità, ripetibilità, riproducibilità, intervallo di misura e standard esistenti. Il confronto è riportato nella seguente tabella.

TABELLA: CRITERI DI QUALITÀ

Metodo di misura	Sostanze		Ripetibilità stimata (1)	Riproducibilità stimata (1)	Intervallo raccomandato	Norme esistenti
	solide	liquide				
1 4 1 Metodo dinamico	basso-fondenti	sì	fino al 25 %	fino al 25 %	da 10^3 Pa a 2×10^3 Pa	—
			1-5 %	1-5 %	da 2×10^3 Pa a 10^5 Pa	—
1 4 2 Metodo statico	sì	sì	5-10 %	5-10 %	da 10 Pa a 10^5 Pa (2)	NFT 20-048 (5)
1 4 3 Isoteniscopio	sì	sì	5-10 %	5-10 %	da 10^2 Pa a 10^5 Pa	ASTM-D 2879-86
1.4 4 Metodo di effusione bilancia a tensione di vapore	sì	sì	5-20 %	fino al 50 %	da 10^{-3} Pa a 1 Pa	NFT 20-047 (6)
1 4 5 Metodo di effusione perdita di peso	sì	sì	10-30 %	—	da 10^{-3} Pa a 1 Pa	—
1 4 6 Metodo di saturazione del gas	sì	sì	10-30 %	fino al 50 %	da 10^{-4} Pa a 1 Pa (2)	—
1 4 7 Metodo del rotore	sì	sì	10-20 %	—	da 10^{-4} Pa a 0,5 Pa	—

(1) Dipendente dal grado di purezza.

(2) Questi metodi possono essere usati anche nel campo da 1 a 10 Pa a condizione di operare con attenzione.

1 6 DESCRIZIONE DEI METODI

1 6 1 Misura dinamica

1 6 1 1 Apparecchiatura

L'apparecchio di misura consiste generalmente in un recipiente per l'ebollizione provvisto di un refrigerante in vetro o metallo (vedi figura 1), strumenti per misurare la temperatura e apparecchi per regolare e misurare la pressione. Un tipico apparecchio di misura è realizzato, come mostra la figura, in vetro resistente al calore ed è composto di 5 parti.

Il tubo grande, parzialmente a doppia parete, consiste in un giunto smerigliato a camicia, un recipiente di raffreddamento ed un ingresso.

Il cilindro di vetro, provvisto di pompa Cottrell, è montato sulla sezione di ebollizione del tubo ed è fornito di una superficie scabra di frammenti di vetro per evitare la formazione di grosse bolle durante il processo di ebollizione.

La temperatura viene misurata con un adatto sensore di temperatura (per esempio un termometro a resistenza, una termocoppia incamiciata) immerso nell'apparecchiatura fino al punto di misurazione (figura 1, numero 5) attraverso un passaggio adatto (per esempio un giunto smerigliato maschio).

Devono essere realizzati i necessari collegamenti con l'apparecchiatura di regolazione e misura della flessione.

Il bulbo, che agisce da polmone, è collegato allo strumento di misura mediante un tubo capillare.

Il recipiente di ebollizione è riscaldato mediante un elemento riscaldante (per esempio un riscaldatore a cartuccia) inserito dal basso nell'apparecchiatura di vetro. La corrente di riscaldamento richiesta viene fissata e regolata tramite una termocoppia.

Il vuoto necessario tra 10^2 Pa e approssimativamente 10^5 Pa viene prodotto mediante una pompa a vuoto.

Per dosare l'aria o l'azoto per la regolazione della pressione (campo di misura approssimativamente $10^2 - 10^5$ Pa) e per la ventilazione si usa una valvola adatta.

La pressione viene misurata con un manometro.

1 6 1 2 Procedimento di misura

La tensione di vapore viene misurata determinando la temperatura di ebollizione del campione a varie pressioni prestabilite approssimativamente tra 10^3 e 10^5 Pa. Una temperatura costante a pressione costante indica che è stata raggiunta la temperatura di ebollizione. Questo metodo non è adatto per la determinazione nel caso di sostanze che fanno schiuma.

La sostanza viene posta in un porta campioni pulito ed asciutto. Con solidi non in forma di polvere si possono incontrare dei problemi, ma questi possono talvolta essere risolti riscaldando la camicia di raffreddamento. Dopo che il recipiente è stato riempito, l'apparecchiatura viene sigillata in corrispondenza della flangia e la sostanza viene degassata. Viene poi impostata la pressione minima desiderata e si accende il riscaldamento. Nello stesso tempo, il sensore di temperatura è collegato ad un registratore.

L'equilibrio è raggiunto quando viene registrata una temperatura di ebollizione costante a pressione costante. Bisogna porre una particolare cura per evitare una formazione di grosse bolle durante l'ebollizione. Inoltre, sul refrigerante deve avvenire una condensazione completa. Quando si determina la tensione di vapore di solidi basso-fondenti, bisogna porre attenzione ad evitare il bloccaggio del condensatore.

Dopo aver registrato il punto di equilibrio così raggiunto, si regola la pressione su un valore più elevato. Questa procedura va ripetuta fino a raggiungere una pressione di 10^5 Pa (per un totale da 5 a 10 punti di misura). A titolo di controllo, la determinazione dei punti di equilibrio deve essere ripetuta a pressioni decrescenti.

1 6 2 Misura statica

1 6 2 1 Apparecchiatura

L'apparecchiatura comprende un contenitore per il campione, un sistema di riscaldamento e raffreddamento per regolare la temperatura del campione e per misurare la temperatura. L'apparecchio comprende anche strumenti per impostare e misurare la pressione. Le figure 2a e 2b illustrano i principi fondamentali implicati.

La camera del campione (figura 2a) è collegata da una parte con un'adatta valvola per alto vuoto e dall'altra con un tubo ad U contenente un opportuno fluido manometrico. Una estremità del tubo ad U è collegata con la pompa da vuoto, la bombola dell'azoto o la valvola di ventilazione, ed un manometro.

Al posto del tubo ad U si può usare un manometro con indicatore di pressione (figura 2b).

Allo scopo di regolare la temperatura del campione, il recipiente del campione, insieme con la valvola e il tubo ad U o il manometro, viene posto in un bagno mantenuto ad una temperatura costante $\pm 0,2$ K. Le misure di temperatura vengono effettuate sulla parete esterna del recipiente contenente il campione o nel recipiente stesso.

Per evacuare l'apparecchio si utilizza una pompa da vuoto a monte della quale vi è una trappola refrigerante.

Nel metodo 2a, la tensione di vapore della sostanza viene misurata indirettamente utilizzando un indicatore di zero. Questo tiene conto del fatto che la densità del fluido nel tubo ad U risulta alterata se la temperatura cambia in maniera consistente.

Come indicatori di zero per il tubo ad U, sono adatti secondo il campo di pressioni e il comportamento chimico della sostanza in esame, i seguenti fluidi: fluidi silconici, ftalati. La sostanza in esame non deve sciogliersi in maniera apprezzabile o reagire con il fluido del tubo ad U.

Per il manometro può venire usato il mercurio nel campo dalla normale pressione atmosferica fino a 10^2 Pa, mentre per l'uso tra 10^2 Pa e 10 Pa sono adatti i fluidi silconici e gli ftalati. I manometri capacitivi a membrana riscaldabile possono essere usati anche al di sotto di 10^{-1} Pa. Esistono anche altri manometri che possono essere usati al di sotto di 10^2 Pa.

1 6 2.2 Procedimento di misura

Prima della misura, tutti i componenti dell'apparecchio mostrato in figura 2 devono essere puliti e asciugati accuratamente.

Per il metodo 2a, riempire il tubo ad U con il liquido scelto, che deve essere degassato a temperatura elevata prima di procedere alla lettura.

La sostanza in esame viene posta nell'apparecchio, che viene poi chiuso, e la temperatura viene ridotta in modo sufficiente per il degassaggio. La temperatura deve essere sufficientemente bassa per assicurare che l'aria sia aspirata fuori ma — nel caso di sistema a componenti multipli — non deve alterare la composizione del materiale. Se richiesto, l'equilibrio può essere raggiunto più rapidamente mediante agitazione.

Il campione può essere sovraraffreddato, per esempio con azoto liquido (attenzione: condensazione dell'aria, fluido di pompaggio) o con una miscela di etanolo e ghiaccio secco. Per misure a bassa temperatura, usare un bagno con regolazione della temperatura collegato ad un ultracriostato.

Con la valvola sopra al recipiente del campione aperta, si applica il vuoto per qualche minuto per rimuovere l'aria. La valvola viene poi chiusa e la temperatura del campione viene ridotta al livello minimo desiderato. Se necessario, l'operazione di degassaggio deve essere ripetuta più volte.

Quando il campione viene riscaldato, la tensione di vapore aumenta. Ciò altera l'equilibrio del fluido nel tubo ad U. Per compensare questo effetto, lasciare entrare azoto o aria nell'apparecchio attraverso una valvola fino a che il fluido indicatore di pressione è nuovamente a zero. La pressione richiesta a questo scopo può essere letta da un manometro di precisione a temperatura ambiente. Questa pressione corrisponde alla tensione di vapore della sostanza a quella particolare temperatura di misura.

Il metodo 2b è simile, ma la tensione di vapore viene letta direttamente.

La dipendenza dalla temperatura della tensione di vapore viene determinata ad intervalli adeguatamente piccoli (approssimativamente da 5 a 10 punti di misura in totale) fino al valore massimo desiderato. Le letture a bassa temperatura devono essere ripetute per verifica.

Se i valori ottenuti dalla ripetizione delle letture non coincidono con la curva ottenuta per la temperatura crescente, la ragione può essere una delle seguenti:

- 1 Il campione contiene ancora aria (per esempio materiali ad elevata viscosità) o sostanze basso-bollenti, che vengono liberate durante il riscaldamento e possono essere rimosse mediante applicazione di vuoto dopo ulteriore sovraraffreddamento.
 - 2 La temperatura di raffreddamento non è sufficientemente bassa. In questo caso si usa come agente refrigerante azoto liquido.
- Se vale il caso 1 o 2, le misure devono essere ripetute.
- 3 La sostanza subisce una reazione chimica nel campo di temperature studiato (per esempio decomposizione, polimerizzazione).

1 6 3 Isoteniscope

Una descrizione completa del metodo è reperibile in letteratura (7). Il principio dell'apparecchio di misura è illustrato nella figura 3. Analogamente al metodo statico descritto al punto 1 6 2, l'isoteniscope si presta all'esame di solidi e liquidi.

Nel caso dei liquidi, la sostanza in esame serve essa stessa da fluido nel manometro ausiliario. Una quantità di liquido sufficiente per riempire il bulbo e il gambo corto della sezione del manometro viene introdotta nell'isoteniscope. L'isoteniscope viene poi collegato ad un sistema di vuoto, l'isoteniscope viene evacuato e poi riempito con azoto. L'evacuazione e la bonifica del sistema vengono ripetute due volte per rimuovere l'ossigeno residuo. L'isoteniscope riempito viene posto in posizione orizzontale in modo che il campione si sparga in uno strato sottile nel bulbo del campione e nella sezione manometrica (parte ad U). La pressione del sistema viene ridotta a 133 Pa e il campione viene riscaldato delicatamente fino a quando incomincia a bollire (rimozione dei gas fissi disciolti). L'isoteniscope viene poi sistemato in modo che il campione ritorni nel bulbo e nel gambo corto del manometro, di modo che siano ambedue completamente riempiti di liquido. La pressione viene mantenuta allo stesso livello usato per il degassaggio; la punta stirata del bulbo porta campione viene riscaldata con una fiamma piccola fino a che i vapori del campione liberati si espandono in modo sufficiente per spostare parte del campione dalla parte superiore del bulbo e del braccio manometrico nella sezione manometrica dell'isoteniscope, creando uno spazio riempito di vapore ed esente da azoto.

L'isoteniscope viene posto in un bagno a temperatura costante e la pressione dell'azoto viene regolata fino a quando coincide con la pressione del campione. L'equilibrio della pressione è indicato dalla sezione manometrica dell'isoteniscope. All'equilibrio, la tensione di vapore dell'azoto è uguale alla tensione di vapore della sostanza. Nel caso di solidi, si usano i liquidi manometrici elencati in 1 6 2.1, secondo il campo di pressioni e di temperature. Il liquido manometrico degassato viene introdotto in una boccia sul braccio lungo dell'isoteniscope. Il solido in esame viene poi posto nel bulbo e degassato a temperatura elevata. Dopo di ciò si inclina l'isoteniscope in modo che il fluido manometrico possa defluire nel tubo ad U. La misura della tensione di vapore in funzione della temperatura viene effettuata come indicato al punto 1 6 2.

1 6 4 Metodo di effusione: bilancia a tensione di vapore

1 6 4.1 Apparecchiatura

In letteratura (1) sono descritte varie versioni dell'apparecchiatura. L'apparecchiatura qui descritta illustra il principio generale implicato (figura 4). La figura 4 mostra i componenti principali dell'apparecchiatura, che comprendono un contenitore d'acciaio inossidabile o vetro per alto vuoto, strumenti per produrre e misurare il vuoto e componenti incorporati per misurare la tensione di vapore su una bilancia. Nell'apparecchio sono incorporati i seguenti componenti:

- Un forno evaporatore provvisto di flangia e ingresso rotativo. Il forno evaporatore è un recipiente cilindrico, fatto per esempio di rame o di lega chimicamente resistente con buona conducibilità termica. Può essere usato anche un recipiente di vetro con parete di rame. Il forno ha un diametro approssimativo di 3-5 cm e un'altezza di 2-5 cm e presenta da 1 a 3 aperture di differenti dimensioni per la corrente di vapore.

Il forno è riscaldato o mediante una piastra riscaldante sottostante o mediante una spirale riscaldante avvolta intorno. Per impedire la dissipazione di calore verso la piastra di base, il riscaldatore è attaccato alla piastra di base mediante un metallo di bassa conducibilità termica (nichel argento o acciaio al cromo nichel), per esempio un tubo di nichel argento collegato ad un ingresso rotativo se si usa un forno con più aperture. Questa disposizione ha il vantaggio di permettere l'introduzione di una barra di rame. Ciò permette di effettuare il raffreddamento dall'esterno utilizzando un bagno di raffreddamento.

- Se il coperchio del forno di rame presenta tre aperture di differenti diametri, a 90° una rispetto all'altra, è possibile coprire vari intervalli di tensione di vapore all'interno dell'intervallo di misura globale (diametri delle aperture compresi approssimativamente tra 0,30 e 4,50 mm). Le aperture più grandi vengono usate per le basse tensioni di vapore, e viceversa. Ruotando il forno, si può selezionare l'apertura desiderata o una posizione intermedia per la corrente di vapore (apertura del forno — schermo — piatto della bilancia) liberando la corrente molecolare o deviandola, attraverso l'apertura del forno, sul piatto della bilancia. Allo scopo di misurare la temperatura della sostanza, in un punto opportuno si posiziona una termocoppia o un termometro a resistenza.
- Al di sopra dello schermo vi è il piatto di una microbilancia di alta sensibilità (vedi avanti). Il piatto della bilancia ha un diametro approssimativo di 30 mm. Un materiale adatto è alluminio placcato d'oro.
- Il piatto della bilancia è circondato da una cassetta di refrigerazione cilindrica di ottone o rame. Secondo il tipo di bilancia, essa presenta aperture per il giogo della bilancia e un'apertura nello schermo per la corrente molecolare, e deve garantire una condensazione completa del vapore sul piatto della bilancia. La dissipazione del calore verso l'esterno è assicurata, per esempio, mediante una barra di rame collegata alla cassetta di refrigerazione. La barra passa attraverso la piastra di base ed è isolata termicamente da essa, per esempio, con un tubo di acciaio al cromo-nichel. La barra è immersa in una bottiglia di Dewar contenente azoto liquido posta sotto la piastra di base, oppure azoto liquido viene fatto circolare attraverso la barra. La cassetta di refrigerazione viene così mantenuta a circa -120 °C. Il piatto della bilancia è raffreddato esclusivamente per irraggiamento ed è soddisfacente per il campo di pressioni in esame (raffreddare approssimativamente per 1 ora prima dell'inizio della misura).
- La bilancia viene posizionata sopra alla cassetta di refrigerazione. Bilance adatte sono, per esempio, una microbilancia elettronica a 2 bracci di alta sensibilità (8) o uno strumento a spirale mobile di elevata sensibilità (vedi linee direttrici OCSE 104, edizione 12-5-1981).
- La piastra di base contiene anche connessioni elettriche per termocoppie (o termometri a resistenza) e serpentine di riscaldamento.
- Nel recipiente viene prodotto il vuoto usando una pompa per vuoto parziale o una pompa per alto vuoto (vuoto richiesto: circa da $1 \text{ a } 2 \cdot 10^{-3} \text{ Pa}$, ottenuto dopo 2 ore di pompaggio). La pressione viene regolata con un adatto manometro a ionizzazione.

1.6.4.2 Procedimento di misura

Il recipiente viene riempito con la sostanza in esame e il coperchio viene chiuso. Lo schermo e la cassetta di refrigerazione vengono portati sopra al forno. L'apparecchiatura viene chiusa e le pompe a vuoto vengono accese. La pressione finale prima di iniziare le misure deve essere di circa 10^{-4} Pa . Il raffreddamento della cassetta di refrigerazione parte da 10^{-2} Pa .

Dopo aver raggiunto il vuoto richiesto, partire con la serie di taratura alla temperatura più bassa richiesta. Si seleziona l'apertura corrispondente del coperchio, e la corrente di vapore passa attraverso lo schermo direttamente sopra all'apertura e colpisce il piatto della bilancia raffreddato. Il piatto della bilancia deve essere sufficientemente grande per assicurare che l'intera corrente guidata dallo schermo lo colpisca. La quantità di moto della corrente di vapore agisce da forza contro il piatto della bilancia e le molecole condensano sulla sua superficie raffreddata.

La quantità di moto e la condensazione simultanea producono un segnale sul registratore. La valutazione dei segnali fornisce due elementi di informazione.

1. Nell'apparecchiatura qui descritta la tensione di vapore è determinata direttamente dalla quantità di moto sul piatto della bilancia (a questo scopo non è necessario conoscere il peso molecolare). (2) Nella valutazione delle letture, bisogna tenere conto dei fattori geometrici, come l'apertura del forno e l'angolo della corrente molecolare.
2. Contemporaneamente si può misurare la massa del condensato e calcolare da ciò la velocità di evaporazione. La tensione di vapore può essere calcolata anche dalla velocità di evaporazione e dal peso molecolare utilizzando l'equazione di Hertz (2).

$$p = c \cdot \sqrt{\frac{2 \pi R T}{M}} \times 10^4$$

dove

G = velocità di evaporazione ($\text{kg s}^{-1} \text{m}^{-2}$)

M = massa molare (g mol^{-1})

T = temperatura (K)

R = costante universale dei gas ($\text{J mol}^{-1} \text{K}^{-1}$)

p = tensione di vapore (Pa)

Dopo aver raggiunto il vuoto necessario, si inizia la serie delle misure alla temperatura di misurazione minima desiderata

Per ulteriori misure, la temperatura viene aumentata per piccoli incrementi fino a che si raggiunge il massimo valore desiderato della temperatura. Il campione viene poi nuovamente raffreddato e si può registrare una seconda curva della tensione di vapore. Se la seconda prova non conferma i risultati della prima prova, può darsi che la sostanza si decomponga nell'intervallo di temperature oggetto delle misure.

1.6.5 Metodo di effusione per perdita di peso

1.6.5.1 Apparecchiatura

L'apparecchiatura di effusione è costituita dai seguenti componenti fondamentali:

- un serbatoio che può essere termostato ed evacuato e nel quale sono posizionate le celle di effusione,
- una pompa per alto vuoto (per esempio una pompa a diffusione o una pompa turbomolecolare) con vacuometro,
- una trappola, in cui si usa azoto liquefatto o ghiaccio secco.

In figura 5 è mostrato un esempio di un recipiente da vuoto in alluminio, riscaldato elettricamente, con 4 celle di effusione in acciaio inossidabile. Il foglio d'acciaio inossidabile dello spessore di circa 0,3 mm presenta un orificio di effusione da 0,2 mm a 1,0 mm di diametro ed è collegato alla cella di effusione mediante un coperchio a vite.

1.6.5.2 Procedimento di misura

La sostanza di riferimento e la sostanza in esame sono introdotte nella cella di effusione, il diaframma metallico con l'orificio viene fissato mediante il coperchio a vite e la cella viene pesata con un'approssimazione di 0,1 mg. La cella viene poi posta nell'apparecchio termostato, che viene poi evacuato a meno di 1/10 della tensione prevista. Ad intervalli di tempo definiti, che variano da 5 a 30 ore, si introduce aria nell'apparecchio e si determina la perdita di massa della cella di effusione ripesandola.

Allo scopo di assicurare che i risultati non siano influenzati da impurezze volatili, la cella viene ripesata ad intervalli di tempo definiti per controllare che la velocità di evaporazione sia costante su almeno due intervalli di tempo.

La tensione di vapore p nella cella di effusione è data da:

$$p = \frac{m}{KA\tau} \sqrt{\frac{2\pi RT}{M}}$$

dove

p = tensione di vapore (Pa)

m = massa della sostanza che lascia la cella nel tempo τ (kg)

τ = tempo (s)

A = area del foro (m^2)

K = fattore di correzione

R = costante universale dei gas ($\text{J mol}^{-1} \text{K}^{-1}$)

T = temperatura (K)

M = massa molecolare (kg mol^{-1})

Il fattore di correzione K dipende dal rapporto tra la lunghezza e il raggio dell'orificio cilindrico

rapporto	0,1	0,2	0,6	1,0	2,0
K	0,952	0,909	0,771	0,672	0,514

L'equazione vista sopra può essere scritta nella forma

$$p = E \sqrt{\frac{I}{M}}$$

dove $E = \frac{1}{KA} \sqrt{2\pi R}$ è la costante di effusione della cella

Questa costante di effusione della cella E può essere determinata mediante sostanze di riferimento (2,9), usando la seguente equazione

$$I = \frac{p(r)}{M(r)} \sqrt{\frac{M(r)}{r}}$$

dove

$p(r)$ = tensione di vapore della sostanza di riferimento (Pa)

$M(r)$ = massa molecolare della sostanza di riferimento (kg mol^{-1})

1.6.6 Metodo della saturazione del gas

1.6.6.1 Apparecchiatura

Un apparecchio tipico usato per eseguire questa prova comprende un certo numero di componenti presentati in figura 6a e descritti nel seguito (1)

Gas inerte

Il gas di trasporto non deve reagire chimicamente con la sostanza in esame. A tale scopo è in genere sufficiente l'azoto, ma talvolta possono essere necessari altri gas (10). Il gas impiegato deve essere secco (vedi figura 6a, riferimento 4 - sensore dell'umidità relativa)

Controllo del flusso

Per assicurare un flusso costante e regolabile del gas attraverso la colonna del saturatore va impiegato un adatto sistema di controllo

Condensatori di raccolta del vapore

I condensatori da impiegare dipendono dalle caratteristiche del particolare campione e dal metodo di analisi prescelto. Il vapore deve essere condensato quantitativamente ed in una forma che ne consenta la successiva analisi. Per talune sostanze saranno adatti condensatori contenenti liquidi, quali l'esano od il glicol etilenico. Per altre sostanze possono essere impiegati assorbenti solidi.

In alternativa alla condensazione dei vapori e successiva analisi, si possono usare tecniche analitiche a flusso continuo, come la cromatografia, per determinare quantitativamente la quantità di materiale trasportato da una quantità nota di gas di trasporto. Inoltre, si può misurare la perdita di massa del campione.

Scambiatore di calore

Per misure a temperature diverse, può essere necessario includere nell'apparecchiatura uno scambiatore di calore.

Colonna di saturazione

La sostanza in esame, sotto forma di soluzione, viene depositata su di un adatto supporto inerte. Il supporto così ricoperto viene introdotto nella colonna di saturazione, le cui dimensioni così come la velocità di flusso del gas di trasporto devono essere tali da assicurare una completa saturazione di quest'ultimo. La colonna di saturazione va termostata. Per misure al di sopra di temperatura ambiente, la zona compresa tra la colonna del saturatore ed i dispositivi di condensazione del vapore deve essere riscaldata in modo di evitare la condensazione della sostanza in esame.

Al fine di ridurre il trasporto di massa per diffusione, a valle della colonna di saturazione si può disporre un capillare (figura 6b)

1 6 6 2 Procedimento di misura

Preparazione della colonna di saturazione

Una soluzione della sostanza in esame in un solvente altamente volatile viene aggiunta ad un'adeguata quantità di supporto. Si deve impiegare una sufficiente quantità di sostanza per mantenere la saturazione per tutta la durata della prova. Si evapora completamente il solvente, in aria o mediante un evaporatore rotante, e si introduce nella colonna di saturazione il materiale ben miscelato. Dopo aver regolato il termostato, si fa passare azoto secco attraverso l'apparecchio.

Misura

I condensatori o i rivelatori a flusso continuo sono collegati alla linea di efflusso della colonna e si registra il tempo. La portata viene controllata all'inizio e ad intervalli regolari durante l'esperimento usando un misuratore a bolle (o in continuo con un flussimetro di massa).

Si deve misurare la pressione all'uscita verso il saturatore. Ciò può essere fatto:

- includendo un manometro tra il saturatore e i condensatori (questa soluzione può non essere soddisfacente in quanto aumenta lo spazio morto e la superficie di adsorbimento),
- determinando la caduta di pressione attraverso il particolare sistema di condensazione impiegato in funzione della velocità di flusso, eseguendo una determinazione a parte (questo metodo può essere non molto soddisfacente per i condensatori a liquido).

Il tempo richiesto per raccogliere la quantità di sostanza in esame necessaria per i differenti metodi d'analisi viene determinato in prove preliminari o stimato per calcolo. In alternativa alla raccolta della sostanza per l'ulteriore analisi, si può usare una tecnica analitica quantitativa a flusso continuo (per esempio la cromatografia). Prima di calcolare la tensione di vapore ad una data temperatura, vanno eseguite prove preliminari per stabilire la velocità di flusso massima ancora capace di saturare completamente il gas di trasporto con il vapore della sostanza. Ciò viene assicurato se il gas di trasporto passa attraverso la colonna di saturazione tanto lentamente che una velocità ancora minore non conduce alla misura di una tensione di vapore superiore.

Il metodo analitico specifico (per esempio gascromatografia o gravimetria) verrà scelto in funzione della sostanza in esame.

Si determina la quantità di sostanza trasportata da un volume noto di gas di trasporto.

1 6 6 3 Calcolo della tensione di vapore

La tensione di vapore è calcolata in base alla densità di vapore, (W/V), mediante l'equazione

$$p = \frac{W}{V} \times \frac{RT}{M}$$

dove

p = tensione di vapore (Pa)

W = massa di sostanza in esame evaporata (g)

V = volume di gas saturato (m^3)

R = costante universale molare dei gas ($J \text{ mol}^{-1} K^{-1}$)

T = temperatura (K)

M = massa molare della sostanza in esame ($g \text{ mol}^{-1}$)

I volumi misurati vanno corretti per tenere conto delle differenze di temperatura e di pressione tra il flussimetro e la colonna di saturazione termostata. Se il flussimetro si trova a valle del condensatore del vapore, possono essere necessarie correzioni che tengano conto degli eventuali prodotti di evaporazione provenienti da esso (1).

1 6 7 Rotore (8, 11, 13)

1 6 7 1 *Apparecchiatura*

La tecnica del rotore può venire messa in atto usando un viscosimetro a rotore come mostrato in figura 8. Un disegno schematico della disposizione sperimentale è mostrato in figura 7.

L'apparecchio di misura è costituito tipicamente da una testa di misurazione a rotore posta in un recipiente termostato (regolato con l'approssimazione di 0,1 °C). Il contenitore del campione viene posto in un recipiente termostato (regolato con un'approssimazione di 0,01 °C), e tutte le parti dell'apparecchiatura vengono tenute ad una temperatura più elevata del contenitore del campione per impedire la condensazione. Un dispositivo di pompa ad alto vuoto viene collegato al sistema mediante valvole per alto vuoto.

La testina di misurazione a rotore è costituita da una pallina d'acciaio (diametro da 4 a 5 mm) disposta in un tubo. La pallina è sospesa e stabilizzata in un campo magnetico, generalmente con l'uso di una combinazione di magneti permanenti e bobine di controllo.

La palla viene fatta ruotare da campi rotanti prodotti dalle bobine. Bobine di trasduzione, che misurano la leggera magnetizzazione laterale sempre presente della pallina, permettono di misurare la sua velocità di rotazione.

1 6 7 2 *Procedimento di misura*

Quando la pallina ha raggiunto una determinata velocità di rotazione $v(o)$ (di solito circa 400 giri al secondo) si interrompe la fornitura di energia ed avviene una decelerazione dovuta all'attrito col gas.

La riduzione della velocità di rotazione viene misurata in funzione del tempo. Poiché l'attrito provocato dalla sospensione magnetica è trascurabile in confronto con l'attrito gassoso, la pressione del gas p è data da:

$$p = \frac{\pi \bar{c} r \rho}{\sigma 10 t} \times \ln \frac{v(t)}{v(o)}$$

dove

\bar{c} = velocità media delle molecole del gas

r = raggio della pallina

ρ = densità di massa della pallina

σ = coefficiente di trasferimento tangenziale della quantità di moto ($\sigma = 1$ per una superficie sferica ideale della pallina)

t = tempo

$v(t)$ = velocità di rotazione dopo il tempo t

$v(o)$ = velocità di rotazione iniziale

Questa equazione può anche essere scritta nella forma

$$p = \frac{\pi \bar{c} r \rho}{10 \sigma} \times \frac{t_n - t_{n-1}}{t_n \times t_{n-1}}$$

dove t_n, t_{n-1} sono i tempi occorrenti per un determinato numero N di rotazioni. Questi intervalli di tempo t_n e t_{n-1} si succedono uno all'altro, e si ha $t_n > t_{n-1}$.

La velocità media delle molecole di gas \bar{c} è data da

$$\bar{c} = \left(\frac{8 RT}{\pi M} \right)^{\frac{1}{2}}$$

dove

T = temperatura (K)

R = costante molare universale dei gas

M = massa molare

2 DATI

La tensione di vapore misurata mediante uno qualunque dei metodi precedenti deve essere determinata per almeno due temperature. Tre o più temperature diverse nell'intervallo da 0 a 50 °C sarebbero preferibili per verificare la linearità della curva di tensione di vapore.

3 RELAZIONE

La relazione sulla prova deve, se possibile, includere le seguenti informazioni:

- metodo usato,
- descrizione precisa della sostanza (identità e impurezze) ed eventuale stadio preliminare di purificazione,
- almeno due valori di tensione di vapore e di temperatura, preferibilmente nel campo da 0 a 50 °C,
- tutti i dati grezzi,
- una curva di $\log p$ contro $1/T$,
- una stima della tensione di vapore a 20 o 25 °C.

Qualora si osservi una transizione (cambiamento di stato, decomposizione), saranno fornite le informazioni seguenti:

- la natura del cambiamento,
- la temperatura a cui il cambiamento si verifica sotto la pressione atmosferica,
- la tensione di vapore a 10 °C e a 20 °C al di sotto della temperatura di transizione, nonché a 10 °C e a 20 °C al di sopra di tale temperatura (a meno che la transizione non consista in un passaggio dallo stato solido allo stato gassoso).

Devono essere riportate tutte le informazioni e osservazioni significative per l'interpretazione dei risultati, in particolare per quanto riguarda le impurezze e lo stato fisico della sostanza.

Appendice 1

Metodo di stima

INTRODUZIONE

I valori calcolati della tensione di vapore possono essere utilizzati

- per decidere quale dei metodi sperimentali sia appropriato,
- per fornire un valore di stima o un valore limite nei casi in cui il metodo sperimentale non possa essere applicato per ragioni tecniche (incluso il caso in cui la tensione di vapore sia molto bassa),
- per aiutare ad identificare i casi nei quali è giustificato omettere la misura sperimentale perché la tensione di vapore è probabile che sia $< 10^{-5}$ Pa a temperatura ambiente

METODO DI STIMA

La tensione di vapore dei liquidi e solidi può essere stimata mediante l'uso della correlazione di Watson modificata (a). L'unico dato sperimentale richiesto è il punto di ebollizione normale. Questo metodo è applicato sull'intervallo di pressioni da 10^5 Pa a 10^{-5} Pa.

Informazioni più precise sul metodo sono fornite nello «Handbook of Chemical Property Estimation Methods» (b).

PROCEDURA DI CALCOLO

Secondo (b), la tensione di vapore viene calcolata come segue

$$\ln P_{vp} \approx \frac{\Delta H_{vb}}{\Delta Z_b R T_b} \left[1 - \left(3 - 2 \frac{T}{T_b} \right)^m - 2 m \left(3 - 2 \frac{T}{T_b} \right)^{m-1} \ln \frac{T}{T_b} \right]$$

dove

T = temperatura di interesse

T_b = punto di ebollizione normale

P_{vp} = tensione di vapore alla temperatura T

ΔH_{vb} = calore di vaporizzazione

ΔZ_b = fattore di compressibilità (stimato in 0,97)

m = fattore empirico che dipende dallo stato fisico alla temperatura di interesse

inoltre

$$\frac{\Delta H_{vb}}{T_b} = K_f (8,75 + R \ln T_b)$$

dove K_f è un fattore empirico che tiene conto della polarità della sostanza. Per diversi tipi di composti i fattori K_f sono elencati nel riferimento (b).

Molto spesso, sono disponibili dei dati nei quali è fornito un punto di ebollizione a pressione ridotta. In tale caso, secondo (b), la tensione di vapore si calcola come segue

$$\ln P_{vp} \approx \ln P_1 + \frac{\Delta H_{v1}}{\Delta Z_b R T_1} \left[1 - \left(3 - 2 \frac{T}{T_1} \right)^m \frac{T_1}{T} - 2 m \left(3 - 2 \frac{T}{T_1} \right)^{m-1} \ln \frac{T}{T_1} \right]$$

dove T_1 è il punto di ebollizione alla pressione ridotta P_1

RELAZIONE

Quando si usa il metodo della stima, la relazione deve includere una documentazione completa del calcolo.

A.5. TENSIONE SUPERFICIALE

I METODO

I metodi descritti si basano sulle linee direttrici OCSE (1). I principi fondamentali sono presentati nel riferimento (2).

1.1 INTRODUZIONE

I metodi qui illustrati si applicano alla misura della tensione superficiale di soluzioni acquose.

Prima di effettuare le prove, è utile disporre di dati preliminari su alcune caratteristiche della sostanza in esame quali la solubilità in acqua, la struttura, il comportamento all'idrolisi e la concentrazione critica per la formazione di micelle.

I metodi qui illustrati si applicano alla maggior parte delle sostanze chimiche senza alcuna limitazione rispetto al loro grado di purezza.

La misura della tensione superficiale col metodo del tensiometro ad anello può essere effettuata soltanto su soluzioni acquose con viscosità dinamica inferiore a 200 mPa s circa.

1.2 DEFINIZIONI ED UNITÀ

Per tensione superficiale si intende l'entalpia libera superficiale per unità di area.

La tensione superficiale si misura in:

N/m (unità SI) oppure in

mN/m (sottomultipli della unità SI);

1 N/m = 10^3 dine/cm,

1 mN/m = 1 dine/cm nel vecchio sistema cgs.

1.3. SOSTANZE DI RIFERIMENTO

Non è necessario utilizzare sostanze di riferimento ogni volta che si esamina una nuova sostanza. Esse servono principalmente per controllare periodicamente l'attendibilità del metodo e per permettere il confronto dei risultati ottenuti con altri metodi.

Nei riferimenti bibliografici (1) e (3) sono citate varie sostanze di riferimento in grado di coprire un ampio campo di valori della tensione superficiale.

1.4. PRINCIPIO DEI METODI

I metodi si basano sulla misura della massima forza che è necessario esercitare in senso verticale ad una staffa o ad un anello a contatto con la superficie del liquido in esame posto in un recipiente di misura affinché detto liquido si distacchi dalla superficie stessa, ovvero ad una lamina che abbia un bordo a contatto con la superficie suddetta per sollevare la pellicola che si è formata.

Le sostanze che sono solubili in acqua ad una concentrazione di almeno 1 mg/l sono esaminate in soluzione acquosa ad un'unica concentrazione.

1.5. CRITERI DI QUALITÀ

I metodi descritti permettono misure più precise di quanto possa essere necessario per valutazioni ¹° ordine ambientale.

1.6. DESCRIZIONE DEI METODI

Si prepara una soluzione della sostanza in acqua distillata. La concentrazione di questa soluzione dovrebbe essere il 90 % del valore corrispondente alla concentrazione di saturazione della sostanza in acqua; quando questa concentrazione supera 1 g/l, si usa per la prova una concentrazione di 1 g/l. Non è necessario eseguire il saggio su sostanze con una solubilità in acqua minore di 1 mg/l.

1.6.1. Metodo della lamina

Vedi ISO 304 e NF T 73-060 (Tensioattivi — Determinazione della tensione superficiale attraverso il sollevamento di pellicole liquide).

1.6.2. Metodo della staffa

Vedi ISO 304 e NF T 73-060 (Tensioattivi — Determinazione della tensione superficiale attraverso il sollevamento di pellicole liquide).

1.6.3. Metodo dell'anello

Vedi ISO 304 e NF T 73-060 (Tensioattivi — Determinazione della tensione superficiale attraverso il sollevamento di pellicole liquide).

1.6.4. Metodo armonizzato dell'anello secondo l'OCSE

1.6.4.1. Apparecchiatura

I tensiometri reperibili in commercio risultano adeguati a questo tipo di misura. Essi consistono delle parti seguenti:

- tavolo mobile per il campione,
- sistema di misurazione della forza,

- elemento di misura (anello),
- recipienti di misura.

1.6.4.1.1 Tavolo mobile per il campione

Il tavolo mobile per il campione viene usato come piano d'appoggio per il recipiente di misura termostato contenente la soluzione in esame. Detto tavolo è montato su di un sostegno assieme al sistema di misurazione della forza.

1.6.4.1.2. Sistema di misurazione della forza

Il sistema di misurazione della forza (vedi la figura) è collocato al di sopra del tavolo che sostiene il campione. L'errore nella misura della forza non deve essere maggiore di $\pm 10^{-6} \text{ N}$, corrispondente ad un limite d'errore di $\pm 0,1 \text{ mg}$ in unità di massa. Nella maggioranza dei casi, la scala di misura dei tensiometri reperibili in commercio è tarata in mN/m , in modo che la tensione superficiale possa essere direttamente letta in mN/m con una incertezza di $0,1 \text{ mN/m}$.

1.6.4.1.3. Elemento di misura (anello)

L'anello è generalmente costituito da un filo di platino-iridio di circa $0,4 \text{ mm}$ di spessore ed avente una circonferenza media di 60 mm . L'anello è sospeso orizzontalmente ad uno stelo metallico e ad una forcilla di supporto in filo metallico che costituiscono il collegamento con il sistema di misurazione della forza (vedi la figura).

Figura

Elemento di misura

(Tutte le quote sono in mm)

1.6.4.1.4. Recipiente di misura

Il recipiente di misura contenente la soluzione in esame deve essere in vetro e permettere la termostatazione. Esso deve essere progettato in modo che, durante la misura, la temperatura della soluzione liquida in esame e della fase gassosa sovrastante la sua superficie rimanga costante e che il campione non possa evaporare. Sono accettabili recipienti cilindrici in vetro di diametro interno non inferiore a 45 mm.

1.6.4.2. Preparazione dell'apparecchiatura

1.6.4.2.1. Pulizia

I recipienti di vetro devono essere accuratamente puliti. Se necessario, essi vanno lavati con miscela solfo-cromica bollente, poi con acido fosforico sciropposo (dall'83 al 98 % in peso di H_3PO_4), abbondantemente risciacquati con acqua di rubinetto, lavati con acqua bidistillata fino a reazione neutra ed infine asciugati o risciacquati con parte del campione liquido in esame.

L'anello deve essere innanzitutto abbondantemente risciacquato con acqua per eliminare ogni sostanza idrosolubile, poi immerso per breve tempo nella miscela solfo-cromica, lavato con acqua bidistillata fino a reazione neutra ed infine riscaldato brevemente su una fiamma a metanolo.

Nota:

Eventuali sostanze contaminanti che non possano essere disciolte o distrutte dalla miscela solfo-cromica o dall'acido fosforico, come ad esempio siliconi, vanno eliminate mediante un opportuno solvente organico.

1.6.4.2.2. Taratura dell'apparecchio

La convalida dell'apparecchiatura consiste nel controllo del punto di zero e nella regolazione dello strumento in modo che esso permetta determinazioni attendibili in mN/m.

Montaggio:

La base dell'apparecchio deve essere posta perfettamente in piano, per esempio utilizzando una livella a bolla d'aria e regolando le apposite viti di livellamento.

Azzeramento dell'apparecchio:

Dopo aver montato l'anello sull'apparecchio e prima di immergerlo nel liquido, il tensiometro deve essere azzerato, controllando inoltre il parallelismo dell'anello con la superficie della soluzione. A tale scopo la superficie della soluzione può essere usata come uno specchio.

Taratura:

La taratura può essere effettuata tramite uno dei due procedimenti seguenti:

- a) per mezzo di una massa: il procedimento si basa sull'impiego di cavalieri di massa nota compresa tra 0,1 e 1,0 g, da collocare sull'anello. Il fattore di calibrazione Φ_A , per il quale tutte le letture dell'apparecchio devono essere moltiplicate, va determinato con la seguente equazione (1):

$$\Phi_A = \frac{\sigma_r}{\sigma_A} \quad (1)$$

dove:

$$\sigma_r = \frac{mg}{2b} \text{ (mN/m)}$$

m = massa del cavaliere (in g),

g = accelerazione di gravità (981 cm.s^{-2} al livello del mare),

b = circonferenza dell'anello (in cm),

σ_A = lettura al tensiometro dopo collocamento del cavaliere sull'anello (in mN/m).

- b) per mezzo dell'acqua: il procedimento si basa sull'impiego di acqua pura, la cui tensione superficiale è nota; per esempio, a 23 °C essa è di 72,3 mN/m. Questo metodo è più rapido della taratura con pesi, ma comporta sempre il rischio che la tensione superficiale dell'acqua risulti alterata a causa della contaminazione con tensioattivi in traccia.

Il fattore di taratura Φ_b , per il quale tutte le letture dell'apparecchio devono essere moltiplicate, va determinato con la seguente equazione (2):

$$\Phi_b = \frac{\sigma_o}{\sigma_g} \quad (2)$$

dove:

σ_o = valore riportato in letteratura per la tensione superficiale dell'acqua (in mN/m),

σ_g = valore misurato della tensione superficiale dell'acqua (in mN/m) entrambi riferiti alla stessa temperatura.

1.6.4.3. Preparazione dei campioni

Vanno preparate soluzioni acquose delle sostanze da esaminare alle concentrazioni richieste ed in assenza di alcun corpo di fondo.

La soluzione deve essere mantenuta a temperatura costante ($\pm 0,5$ °C). Poiché la tensione superficiale di una soluzione nel recipiente di misura varia con il tempo, devono essere effettuate più misure a distanza l'una dall'altra, in modo da poter tracciare un grafico rappresentante le variazioni della tensione superficiale in funzione del tempo. Lo stato di equilibrio si considera raggiunto quando non si riscontrano più variazioni.

La polvere e la contaminazione gassosa ad opera di altre sostanze interferiscono con le misure. Queste devono pertanto essere effettuate sotto una copertura di protezione.

1.6.5. Condizioni sperimentali

Le misure vanno eseguite a 20 °C circa con variazioni non superiori a $\pm 0,5$ °C.

1.6.6. Esecuzione della prova

Le soluzioni da sottoporre a misura devono essere trasferite nel recipiente di misura accuratamente pulito, avendo cura di evitare la formazione di schiuma, e successivamente il recipiente di misura va collocato sul tavolo dell'apparecchio di prova. Il piano del tavolo va alzato insieme al recipiente fino ad immergere l'anello sotto la superficie della soluzione in esame. Il piano del tavolo va poi abbassato gradualmente ed uniformemente (ad una velocità di circa 0,5 cm/min), in modo da staccare l'anello dalla superficie, fino a raggiungere il massimo della forza. Lo strato liquido attaccato all'anello non deve separarsi da esso. Al termine della misura, l'anello va nuovamente immerso sotto la superficie della soluzione ed il procedimento ripetuto finché si ottenga un valore costante della tensione superficiale. In ciascuna determinazione va registrato il tempo trascorso dal trasferimento della soluzione nel recipiente di misura. Le letture devono essere effettuate in corrispondenza dello sforzo massimo necessario per distaccare l'anello dalla superficie del liquido.

2. DATI

Per calcolare la tensione superficiale, il valore in mN/m letto sull'apparecchio va innanzitutto moltiplicato per il fattore di calibrazione Φ_a o Φ_b (secondo il procedimento di taratura adottato). Si otterrà così un valore approssimativo, che deve essere a sua volta opportunamente corretto.

Harkins e Jordan (4) hanno determinato alcuni fattori di correzione empirici per i valori della tensione superficiale misurata col metodo dell'anello, i quali dipendono dalle dimensioni dell'anello, dalla densità del liquido e dalla sua tensione superficiale.

Poiché la determinazione del fattore di correzione con le tabelle di Harkins e Jordan per ciascuna singola misura di tensione superficiale risulta troppo laboriosa, per le soluzioni acquose può applicarsi un metodo semplificato, consistente nel desumere la tensione superficiale corretta direttamente dalla tabella qui di seguito riportata (per valori compresi tra quelli tabulati si può ricorrere all'interpolazione)

TABELLA: CORREZIONE DEI VALORI SPERIMENTALI DELLA TENSIONE SUPERFICIALE

Valida soltanto per soluzioni acquose con $\rho \approx 1 \text{ g/cm}^3$

$R = 9,55 \text{ mm}$ (raggio medio dell'anello)

$r = 0,185 \text{ mm}$ (spessore medio del filo metallico)

Valore sperimentale (mN/m)	Valore corretto (mN/m)	
	Taratura con pesi (vedi punto 1 6 4 2 2, lettera a)	Taratura con acqua (vedi punto 1 6 4 2 2, lettera b)
20	16,9	18,1
22	18,7	20,1
24	20,6	22,1
26	22,4	24,1
28	24,3	26,1
30	26,2	28,1
32	28,1	30,1
34	29,9	32,1
36	31,8	34,1
38	33,7	36,1
40	35,6	38,2
42	37,6	40,3
44	39,5	42,3
46	41,4	44,4
48	43,4	46,5
50	45,3	48,6
52	47,3	50,7
54	49,3	52,8
56	51,2	54,9
58	53,2	57,0
60	55,2	59,1
62	57,2	61,3
64	59,2	63,4
66	61,2	65,5
68	63,2	67,7
70	65,2	69,9
72	67,2	72,0
74	69,2	—
76	71,2	—
78	73,2	—

Questa tabella è stata compilata sulla base della correzione secondo Harkins e Jordan, in modo analogo alla norma DIN 53914 per l'acqua e le soluzioni acquose (densità $\rho = 1 \text{ g/cm}^3$) e per anelli reperibili in commercio aventi dimensioni di $R = 9,55 \text{ mm}$ (raggio medio dell'anello) e $r = 0,185 \text{ mm}$ (spessore del filo metallico). La tabella fornisce i valori corretti per le misure di tensione superficiale effettuate dopo taratura con pesi o con acqua.

In alternativa, la tensione superficiale può essere calcolata senza taratura preliminare ricorrendo alla formula seguente

$$\sigma = \frac{f \times F}{4 \pi R}$$

dove

F = forza misurata al dinamometro al punto di rottura della pellicola,

R = raggio dell'anello,

f = fattore di correzione (1)

3 RELAZIONE

3.1 RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- metodo usato;
- tipo d'acqua o soluzione impiegata;
- descrizione precisa della sostanza (identità e impurezze);
- risultati delle misure: tensione superficiale (lettura), indicando sia le singole letture e la loro media che la media corretta (tenendo conto del fattore specifico dell'apparecchio e della tabella di correzione);
- concentrazione della soluzione;
- temperatura di esecuzione delle prove;
- età della soluzione impiegata; in particolare il tempo trascorso tra la preparazione della soluzione e le misure;
- descrizione della variazione della tensione superficiale col tempo dopo il trasferimento della soluzione nel recipiente di misura;
- tutte le informazioni e osservazioni utili per l'interpretazione dei risultati, in particolare per quanto riguarda le impurezze e lo stato fisico della sostanza.

3.2 INTERPRETAZIONE DEI RISULTATI

Considerando che l'acqua distillata ha una tensione superficiale di 72,75 mN/m a 20 °C, le sostanze che presentano una tensione superficiale minore di 60 mN/m nelle condizioni di misura previste da questo metodo devono essere considerate come materiali tensioattivi.

A.6. IDROSOLUBILITÀ

1. METODO

I metodi descritti sono basati sulle linee direttrici OCSE (1).

1.1. INTRODUZIONE

Per l'esecuzione della prova in oggetto è utile disporre di informazioni preliminari sulla formula di struttura, la tensione di vapore, la costante di dissociazione e l'idrolisi (in funzione del pH) della sostanza in esame.

Non esiste un procedimento unico che sia applicabile a tutto l'intervallo delle possibili solubilità in acqua.

I due metodi di prova descritti nel seguito coprono l'intera gamma della solubilità, ma non sono applicabili a sostanze volatili:

- il primo si applica a sostanze essenzialmente pure, scarsamente solubili ($< 10^{-2}$ g/l) e stabili in acqua, e viene definito «metodo della eluizione su colonna»;
- il secondo si applica a sostanze essenzialmente pure con solubilità più elevata ($> 10^{-2}$ g/l) e stabili in acqua, e viene definito «metodo del matraccio».

La solubilità in acqua della sostanza esaminata può essere considerevolmente alterata dalla presenza di impurezze.

1.2. DEFINIZIONI ED UNITÀ

La solubilità in acqua di una sostanza è definita come la concentrazione di saturazione della sostanza in acqua ad una determinata temperatura. La solubilità in acqua è espressa in unità di massa per volume di soluzione. L'unità SI è il kg/m³ (si può anche far uso del g/l).

1.3. SOSTANZE DI RIFERIMENTO

Non è necessario utilizzare sostanze di riferimento ogni volta che si esamina una nuova sostanza. Esse servono principalmente per controllare periodicamente l'attendibilità del metodo e per permettere il confronto con risultati ottenuti mediante altri metodi.

1.4. PRINCIPIO DEL METODO

Tramite una semplice prova preliminare si stabilisce la quantità approssimativa del campione ed il tempo necessario per raggiungere la concentrazione di saturazione.

1.4.1. Metodo dell'eluizione su colonna

Questo metodo si basa sull'eluizione con acqua della sostanza in esame da una microcolonna riempita con materiale di supporto inerte, come perline di vetro o sabbia, con un eccesso della sostanza stessa. La solubilità in acqua viene valutata quando la concentrazione della sostanza nell'eluato è costante. Ciò si deduce dal fatto che la concentrazione in funzione del tempo raggiunge un valore costante.

1.4.2. Metodo del matraccio

In questo metodo la sostanza (polverizzata, se solida) è disciolta in acqua ad una temperatura leggermente superiore a quella del saggio. Quando si raggiunge la saturazione, la miscela viene raffreddata e mantenuta alla temperatura della determinazione, agitando per tutto il tempo necessario a raggiungere l'equilibrio. In alternativa, la misura può essere eseguita direttamente alla temperatura di prova se, mediante un appropriato campionamento, si può essere sicuri di avere raggiunto l'equilibrio di saturazione. Successivamente, si determina mediante un opportuno metodo analitico la concentrazione della massa della sostanza nella soluzione acquosa, quest'ultima non deve contenere particelle indissolte.

1.5 CRITERI DI QUALITÀ

1.5.1 Ripetibilità

Per il metodo dell'eluizione su colonna, si può ottenere una ripetibilità inferiore al 30 %, per il metodo del matraccio essa dovrebbe essere inferiore al 15 %.

1.5.2 Rivelabilità

La rivelabilità dipende dal metodo d'analisi, si possono comunque effettuare determinazioni della concentrazione di massa fino a 10^{-6} g/l.

1.6 DESCRIZIONE DEL METODO

1.6.1 Condizioni di determinazione

La prova deve essere eseguita preferibilmente a $20\text{ °C} \pm 0,5\text{ °C}$. Se si presume che ci sia una dipendenza della solubilità anche dalla temperatura ($> 3\%$ per $^{\circ}\text{C}$), la prova deve essere eseguita ad altre due temperature di almeno 10 °C al di sopra e al di sotto di quella scelta inizialmente. In questo caso il controllo della temperatura deve rientrare in $\pm 0,1\text{ °C}$. La temperatura prescelta deve essere mantenuta costante in tutti i componenti importanti della strumentazione.

1.6.2 Prova preliminare

In un cilindro graduato da 10 ml, chiuso con tappo di vetro e contenente all'incirca 0,1 g del campione (le sostanze solide devono essere polverizzate), vengono versati volumi crescenti di acqua distillata a temperatura ambiente, secondo le indicazioni riportate nella seguente tabella.

0,1 g solubili in «x» ml di acqua	0,1	0,5	1	2	10	100	>100
Solubilità approssimativa (g/l)	> 1.000	1.000-200	200-100	100-50	50-10	10-1	< 1

Dopo ciascuna aggiunta delle quantità d'acqua indicate, la miscela viene vigorosamente agitata per 10 minuti e controllata visualmente per accertare la presenza di particelle non disciolte del campione. Se, dopo l'aggiunta di 10 ml d'acqua, il campione, o parte di esso, rimane indisciolto, l'esperimento deve essere ripetuto in un cilindro graduato da 100 ml con volumi d'acqua maggiori. Per solubilità inferiori, il tempo necessario per sciogliere la sostanza può essere considerevolmente più lungo (si devono prevedere almeno 24 ore). La solubilità approssimativa è indicata nella tabella in corrispondenza del volume d'acqua aggiunto per ottenere la dissoluzione completa del campione. Se la sostanza è ancora manifestamente insolubile, occorre attendere più di 24 ore (fino ad un massimo di 96 ore), oppure si deve effettuare un'ulteriore diluizione per accertarsi se debba essere usato il metodo dell'eluizione su colonna o il metodo del matraccio.

1.6.3 Metodo dell'eluizione su colonna

1.6.3.1 Materiale di supporto, solvente ed eluente

Il materiale di supporto per il metodo dell'eluizione su colonna deve essere inerte. Possibili materiali adatti allo scopo sono perline di vetro e sabbia. Per distribuire la sostanza in esame sul materiale di supporto, va utilizzato un opportuno solvente volatile di purezza analitica. Come eluente va utilizzato acqua bidistillata ottenuta tramite apparecchi in vetro od in quarzo.

Nota

Non deve utilizzarsi acqua proveniente direttamente da scambiatore di ioni di natura organica.

1.6.3.2. *Caricamento del supporto*

Si pesano circa 600 mg del materiale di supporto, che si trasferiscono poi in un pallone a base tonda da 50 ml.

Si scioglie nel solvente prescelto una quantità pesata opportuna della sostanza da esaminare. Una quantità appropriata di questa soluzione viene aggiunta al materiale di supporto. Il solvente deve essere completamente evaporato, per esempio in un evaporatore rotante. In caso contrario non si raggiunge la saturazione con acqua del supporto a causa degli effetti di ripartizione sulla superficie del materiale di supporto.

Il caricamento del materiale di supporto può causare problemi (risultati erranei) se la sostanza di prova si deposita sotto forma di olio o di una differente fase cristallina. Il problema deve essere esaminato sperimentalmente e i dettagli riportati nella relazione.

Il materiale di supporto così caricato viene lasciato a bagno approssimativamente per 2 ore in circa 5 ml di acqua, e quindi la sospensione viene introdotta nella microcolonna. In alternativa, si può versare il materiale di supporto già ricoperto della sostanza ed essiccato nella microcolonna previamente riempita d'acqua e quindi lasciare il tutto ad equilibrarsi per circa 2 ore.

Procedimento di determinazione:

L'eluizione della sostanza dal materiale di supporto può essere eseguita in due modi diversi:

- con una pompa di circolazione (si veda la figura 1),
- con un recipiente di livellamento (si veda la figura 4).

1.6.3.3. *Metodo dell'eluizione su colonna con pompa di circolazione*

Apparecchiatura:

La rappresentazione schematica di un sistema convenzionale è riportata nella figura 1. La figura 2 presenta una microcolonna di adatte caratteristiche, che peraltro può avere altre misure, purché vengano rispettati i criteri di riproducibilità e sensibilità. La colonna deve comprendere uno spazio di testa pari ad almeno cinque volte il volume del letto d'acqua ed essere in grado di contenere un minimo di cinque campioni. In alternativa, le dimensioni possono anche essere ridotte qualora si impieghi un solvente di riempimento per sostituire i primi cinque volumi del letto d'acqua, scartati perché contenenti impurezze.

La colonna deve essere collegata ad una pompa di circolazione capace di assicurare una portata di circa 25 ml/h. La pompa è collegata mediante giunti in politetrafluoroetilene (PTFE) e/o in vetro. La colonna e la pompa, dopo il montaggio, devono permettere il campionamento dell'effluente e l'equilibratura dello spazio di testa a pressione atmosferica. Il materiale della colonna è sostenuto da un batuffolo di lana di vetro (5 mm), che serve anche da filtro per le particelle. La pompa di circolazione può essere per esempio una pompa peristaltica od una pompa a membrana (si deve fare attenzione affinché non ci sia contaminazione e/o adsorbimento da parte del materiale del tubo).

Procedimento di misura:

Si avvia il flusso attraverso la colonna. Si raccomanda di usare una portata di approssimativamente 25 ml/h (che corrisponde a 10 volumi del letto per ora per la colonna descritta). Si devono scartare almeno i primi cinque volumi per allontanare le impurezze solubili in acqua. Successivamente si lascia funzionare la pompa di circolazione fino al raggiungimento dell'equilibrio; ciò viene accertato sulla base di cinque campioni successivi, le concentrazioni dei quali non differiscono più del $\pm 30\%$ con distribuzione casuale. Questi campioni devono essere distanziati l'uno dall'altro da intervalli di tempo corrispondenti al passaggio di almeno dieci volte il volume del letto di eluente.

1.6.3.4. *Metodo dell'eluizione su colonna con recipiente di livellamento*

Apparecchiatura (si vedano le figure 3 e 4):

Recipiente di livellamento: il collegamento con il recipiente di livellamento si realizza tramite un giunto di vetro smerigliato, connesso con un tubo in teflon. Si raccomanda una velocità di flusso di circa 25 ml/h. Frazioni eluite consecutivamente vanno prelevate ed analizzate con il metodo prescelto.

Procedimento di misura:

Per determinare la solubilità in acqua si utilizzano le frazioni eluite nella fase centrale, dove le concentrazioni devono risultare costanti ($\pm 30\%$) in almeno cinque frazioni consecutive.

In ambedue i casi (sia che si usi una pompa di circolazione sia che si usi un vaso di livellamento), si deve eseguire una seconda prova con una velocità di flusso uguale alla metà di quella della prima prova. Se i risultati delle due prove concordano, la determinazione è soddisfacente. Se si misura una solubilità manifestamente superiore alla portata minore, il dimezzamento della velocità di flusso va proseguito finché due prove successive non forniscano lo stesso valore della solubilità.

In entrambi i casi (utilizzando una pompa di circolazione od un recipiente di livellamento), l'eventuale presenza di materia colloidale va controllata tramite l'effetto Tyndall (diffusione della luce). La presenza di tali particelle toglie validità ai risultati e pertanto si deve ripetere la determinazione migliorando l'azione filtrante della colonna.

Va registrato il pH di ogni campione. Deve essere eseguita una seconda prova alla stessa temperatura.

1.6.4. Metodo del matraccio

1.6.4.1. Apparecchiatura

Per il metodo del matraccio è necessario il seguente materiale:

- normale strumentazione e vetreria di laboratorio,
- un apparecchio adatto per l'agitazione delle soluzioni a temperatura costante e controllata,
- una centrifuga (preferibilmente con termostato), se necessaria quando siano presenti emulsioni, e
- apparecchiatura per determinazioni analitiche.

1.6.4.2. Procedimento di misura

La quantità di materiale necessario per saturare il volume di acqua viene valutata in base alla prova preliminare. Il volume di acqua necessario dipenderà dal metodo analitico e dall'intervallo di solubilità. Una quantità di materiale pari a cinque volte quella determinata in conformità a quanto detto sopra viene pesata direttamente in tre recipienti di vetro (per esempio, provette da centrifuga, beute) provvisti di tappi di vetro. A ciascun recipiente viene aggiunto il volume prescelto di acqua e quindi i recipienti vengono chiusi ermeticamente. Questi sono poi agitati a 30 °C si deve utilizzare un apparecchio di agitazione o di mescolamento che funzioni a temperatura costante, per esempio un agitatore magnetico in bagno d'acqua termostato. Dopo un giorno, uno dei recipienti viene prelevato e riequilibrato per 24 ore alla temperatura della determinazione, con agitazione intermittente. Il contenuto del recipiente viene poi centrifugato alla temperatura di prova, e si misura con un opportuno metodo analitico la concentrazione del composto nella fase acquosa limpida. Gli altri due recipienti vengono trattati in modo analogo dopo una equilibratura iniziale a 30 °C per due e tre giorni, rispettivamente. Se i valori di concentrazione concordano, nei limiti richiesti per la riproducibilità, almeno per i due ultimi campioni, la prova è positiva. Se invece i dati relativi ai recipienti 1, 2 e 3 mostrano una tendenza verso valori crescenti, l'intera prova deve essere ripetuta utilizzando tempi di equilibratura più lunghi.

Il procedimento di misura può anche venire eseguito senza preincubazione a 30 °C. Allo scopo di stimare la velocità con cui si stabilisce l'equilibrio di saturazione, si prelevano dei campioni fino a che il tempo di agitazione non influisce più sulla concentrazione della soluzione di prova.

Va riportato il pH di ciascun campione.

1.6.5. Analisi

Per queste determinazioni va preferito un metodo analitico specifico per la sostanza in esame, poiché piccole quantità di impurezze solubili possono causare forti errori nella misura della solubilità. Esempi di tali metodi sono la gascromatografia, la cromatografia liquida, procedimenti di titolazione, procedimenti fotometrici, procedimenti voltammetrici.

2. DATI**2.1. METODO DELL'ELUIZIONE SU COLONNA**

Per ciascuna prova si deve calcolare il valore medio di almeno cinque campioni consecutivi, prelevati in corrispondenza della fase di costanza di saturazione, nonché la deviazione standard. I risultati devono essere presentati in unità di massa per volume di soluzione.

Le medie calcolate su due prove con l'utilizzo di portate differenti vengono confrontate e devono presentare una ripetibilità inferiore al 30 %.

2.2. METODO DEL MATRACCIO

Si devono riportare i singoli risultati per ciascuno dei tre matracci e i risultati giudicati costanti (ripetibilità entro il 15 %) devono essere mediati e presentati in unità di massa per volume di soluzione. Ciò può richiedere la conversione delle unità di massa in unità di volume, utilizzando la densità quando la solubilità sia molto elevata (> 100 g/l).

3. RELAZIONE**3.1. METODO DELLA ELUIZIONE SU COLONNA**

La relazione sulla prova deve, se possibile, includere le seguenti informazioni:

- i risultati della prova preliminare;
- la descrizione precisa della sostanza (identità e impurezze);
- le concentrazioni, flussi e pH individuali di ciascun campione;
- le medie e le deviazioni standard di almeno cinque campioni nella zona di saturazione costante per ciascuna prova;
- la media delle due prove successive accettabili;
- la temperatura dell'acqua durante il processo di saturazione;
- il metodo di analisi utilizzato;
- la natura del materiale di supporto utilizzato;
- il procedimento di carica del materiale di supporto;
- il solvente utilizzato;
- l'indicazione di eventuale instabilità chimica della sostanza durante la prova e il metodo utilizzato;
- tutte le informazioni attinenti all'interpretazione dei risultati, in particolare per quanto riguarda le impurezze e lo stato fisico della sostanza.

3.2. METODO DEL MATRACCIO

La relazione sulla prova deve, se possibile, includere le seguenti informazioni:

- i risultati della prova preliminare;
- la descrizione precisa della sostanza (identità ed impurezze);
- le singole determinazioni analitiche e la media nel caso in cui più di un valore sia stato determinato per ciascun matraccio;
- il pH di ciascun campione;

- la media dei valori per i diversi matracci, i cui risultati siano concordanti;
- la temperatura di determinazione;
- il metodo analitico utilizzato;
- l'indicazione di eventuale instabilità chimica della sostanza durante la prova e il metodo utilizzato;
- tutte le informazioni attinenti all'interpretazione dei risultati, in particolare per quanto riguarda le impurezze e lo stato fisico della sostanza.

A.8. COEFFICIENTE DI RIPARTIZIONE

1 METODO

Il metodo del «dibattimento in pallone» descritto è basato sulle linee direttrici OCSE (1)

1.1 INTRODUZIONE

Per eseguire questa prova è utile disporre di informazioni preliminari sulla formula di struttura, la costante di dissociazione, la solubilità in acqua, l'idrolisi, la solubilità in n-ottanolo e la tensione superficiale della sostanza

La misura sulle sostanze ionizzabili deve essere eseguita solo nella loro forma non ionizzata (acido libero o base libera), prodotta mediante l'uso di un tampone appropriato con un pH di almeno una unità inferiore (acido libero) o superiore (base libera) al pK.

Questo metodo di prova include due procedure separate — il metodo dell'agitazione in pallone e la cromatografia liquida ad alte prestazioni (HPLC). Il primo può essere applicato quando il valore di $\log P_{oa}$ (per le definizioni si veda più avanti) ricade nel campo da -2 a 4 e il secondo nel campo da 0 a 6. Prima di eseguire una delle due procedure sperimentali, si deve ricavare una stima preliminare del coefficiente di ripartizione

Il metodo del dibattimento in pallone vale solo per sostanze essenzialmente pure, solubili in acqua e in n-ottanolo. Non è applicabile a materiali tensioattivi (per i quali si deve fornire un valore calcolato o una stima basata sulle solubilità individuali in n-ottanolo e in acqua)

Il metodo HPLC non è applicabile ad acidi e basi forti, complessi metallici, materiali tensioattivi o sostanze che reagiscono con l'eluente. Per questi materiali, si deve fornire un valore calcolato o una stima basata sulle solubilità individuali in n-ottanolo e acqua

Il metodo HPLC è meno sensibile alla presenza di impurezze nel composto in esame che non il metodo dell'agitazione in pallone. Tuttavia, in alcuni casi, le impurezze possono rendere difficile l'interpretazione dei risultati perché l'assegnazione dei picchi diventa incerta. Per le miscele che forniscono una banda non risolta, si devono indicare i limiti inferiore e superiore di $\log P$

1.2 DEFINIZIONI ED UNITÀ

Il coefficiente di ripartizione (P) si definisce come il rapporto tra le concentrazioni all'equilibrio (c_i) di una sostanza disciolta in un sistema costituito da due solventi pressoché immiscibili. Nel caso del n-ottanolo e dell'acqua

$$P_{oa} = \frac{c_{n-ottanolo}}{c_{acqua}}$$

Il coefficiente di ripartizione (P) è pertanto il quoziente di due concentrazioni e viene generalmente espresso, sotto forma del suo logaritmo decimale ($\log P$)

1.3 SOSTANZE DI RIFERIMENTO

Metodo del dibattimento in pallone

Non è necessario utilizzare sostanze di riferimento ogni volta che si esamina una nuova sostanza. Esse servono principalmente per controllare periodicamente l'attendibilità del metodo e per permettere il confronto con risultati ottenuti mediante altri metodi.

Metodo HPLC

Allo scopo di correlare i dati di un composto misurati per HPLC con il suo P, si deve tracciare un grafico di taratura di $\log P$ contro i dati cromatografici utilizzando almeno 6 punti di riferimento. Sta all'utilizzatore selezionare le sostanze di riferimento appropriate. Se possibile, almeno un composto di riferimento deve avere

un $P_{0,2}$ al di sopra di quello della sostanza in esame e un altro un $P_{0,2}$ al di sotto di quello della sostanza in esame. Per valori di $\log P$ minori di 4, la taratura può essere basata su dati ottenuti mediante il metodo del dibattimento in pallone. Per valori di $\log P$ maggiori di 4, la taratura può essere basata su valori di letteratura convalidati, purché siano in accordo con i valori calcolati. Per una migliore accuratezza, è preferibile scegliere composti di riferimento strutturalmente simili alla sostanza in esame.

Sono disponibili elenchi estesi di valori di $\log P_{0,2}$ per molti gruppi di composti chimici (2) (3). Se non sono disponibili dati di coefficienti di ripartizione di composti strutturalmente simili, si può allora usare una taratura più generale basata su altri composti di riferimento.

In appendice 2 è fornito un elenco di sostanze di riferimento raccomandate e dei loro valori di $P_{0,2}$.

1.4. PRINCIPIO DEL METODO

1.4.1. Metodo del dibattimento in pallone

Per determinare il coefficiente di ripartizione è necessario raggiungere l'equilibrio tra tutti i componenti che interagiscono nel sistema, e si devono determinare le concentrazioni delle sostanze disciolte nelle due fasi. Un esame della letteratura sull'argomento indica che si possono utilizzare varie tecniche per risolvere questo problema, cioè l'accurata miscelazione delle due fasi seguita dalla loro separazione per poter determinare la concentrazione all'equilibrio della sostanza in esame.

1.4.2. Metodo HPLC

La misura viene eseguita su colonne analitiche impaccate con una fase solida disponibile in commercio contenente idrocarburi a catena lunga (per esempio C_8 , C_{18}) chimicamente legati su silice. I prodotti chimici iniettati su una colonna si muovono lungo di essa a velocità differenti a causa del differente grado di ripartizione tra la fase mobile e la fase stazionaria idrocarbonica. Miscele di composti chimici vengono eluite nell'ordine della loro idrofobicità, dove i composti chimici solubili in acqua sono eluiti per primi e i composti chimici liposolubili per ultimi, in proporzione al loro coefficiente di ripartizione idrocarburo-acqua. Questo permette di stabilire la relazione esistente tra il tempo di ritenzione su tale colonna (a fase inversa) e il coefficiente di ripartizione n-ottanolo/acqua. Il coefficiente di ripartizione viene dedotto dal *fattore di capacità* k , fornito dall'espressione:

$$k = \frac{t_R - t_0}{t_0}$$

in cui t_R = tempo di ritenzione della sostanza in esame e t_0 = tempo medio richiesto perché una molecola di solvente passi attraverso la colonna (tempo morto).

Non sono richiesti metodi analitici quantitativi, ed è necessaria solo la determinazione dei tempi di eluizione.

1.5. CRITERI DI QUALITÀ

1.5.1. Ripetibilità

Metodo del dibattimento in pallone

Per assicurare l'accuratezza del coefficiente di ripartizione, vanno eseguite determinazioni in doppio in tre diverse condizioni sperimentali, così da poter variare la quantità della sostanza considerata nonché il rapporto tra i volumi dei solventi. I valori determinati per il coefficiente di ripartizione, espressi come logaritmi decimali, devono essere compresi in un intervallo di $\pm 0,3$ unità logaritmiche.

Metodo HPLC

Al fine di aumentare la validità della misura, si devono eseguire determinazioni in doppio. I valori di $\log P$ derivati dalle singole misure devono essere compresi in un intervallo di $\pm 0,1$ unità logaritmiche.

1 5 2 Sensibilità

Metodo del dibattimento in pallone

L'intervallo di misura del metodo è definito dal limite di rivelabilità del procedimento analitico. Questo deve essere sufficiente per permettere la valutazione dei valori di $\log P_{oa}$ nel campo da -2 a 4 (occasionalmente, quando si verificano le opportune condizioni, questo intervallo può essere esteso ad un $\log P_{oa}$ fino a 5) quando la concentrazione del soluto in una delle due fasi non è superiore a 0,01 mol/l.

Metodo HPLC

Il metodo HPLC permette di stimare i coefficienti di ripartizione nel campo di $\log P_{oa}$ da 0 a 6

Normalmente, il coefficiente di ripartizione di un composto può essere stimato entro ± 1 unità logaritmica del valore ottenibile con il metodo del dibattimento in pallone. In letteratura è possibile trovare correlazioni tipiche (4) (5) (6) (7) (8). Un'accuratezza più elevata si può in genere ottenere con grafici di correlazione basati su composti di riferimento di struttura simile (9)

1 5 3 Specificità

Metodo del dibattimento in pallone

La legge di ripartizione di Nernst si applica esclusivamente a soluzioni diluite a temperatura, pressione e pH costanti. Essa è rigorosamente valida solo per una sostanza pura dispersa tra due solventi puri. Qualora in una delle due fasi, od in ambedue, siano presenti più soluti diversi, ciò può alterare i risultati

La dissociazione o l'associazione delle molecole disciolte portano a deviazioni dalla legge di ripartizione di Nernst. Tali deviazioni sono evidenziate dal fatto che il coefficiente di ripartizione varia in funzione della concentrazione della soluzione

Dati gli equilibri multipli che hanno luogo, questo metodo non può essere applicato a composti ionizzabili senza ricorrere ad opportuni fattori di correzione. Per tali composti si deve prendere in considerazione l'uso di soluzioni tampone invece di acqua; il pH del tampone deve differire di almeno un'unità di pH dal pKa della sostanza, tenendo presente la significatività di questo pH per l'ambiente.

1 6 DESCRIZIONE DEL METODO

1 6 1 Stima preliminare del coefficiente di ripartizione

Il coefficiente di ripartizione viene stimato preferibilmente utilizzando un metodo di calcolo (si veda l'appendice 1), o, dove appropriato, dal rapporto delle solubilità della sostanza in esame nei solventi puri (10)

1 6 2 Metodo del dibattimento in pallone

1 6 2 1 Preparazione

n-ottanolo la determinazione del coefficiente di ripartizione deve essere eseguita con reattivi per analisi di elevata purezza

Acqua: va impiegata acqua distillata o bidistillata in apparecchi di vetro o quarzo. Per i composti ionizzabili, si devono usare soluzioni tampone al posto dell'acqua, se giustificato

Nota

Non si deve usare acqua prelevata direttamente da uno scambiatore di ioni

1.6.2.1.1. Presaturazione dei solventi

Prima di determinare il coefficiente di ripartizione, le fasi del sistema di solventi devono essere mutuamente saturate mediante agitazione alla temperatura della determinazione. Per far ciò è vantaggioso agitare per 24 ore con un agitatore meccanico due grandi bottiglie di riserva contenenti rispettivamente n-ottanolo ed acqua, entrambi di grande purezza, addizionati ciascuno di una adeguata quantità dell'altro solvente, e poi lasciate riposare abbastanza a lungo da consentire la separazione delle fasi ed il raggiungimento dello stato di saturazione.

1.6.2.1.2. Preparazione per la determinazione

L'intero volume del sistema bifasico deve riempire quasi completamente il recipiente di misura. Ciò permetterà di evitare le perdite di materiale per volatilizzazione. I rapporti in volume e le quantità delle sostanze da impiegare devono essere stabilite tenendo conto:

- della valutazione preliminare del coefficiente di ripartizione (si veda sopra);
- della quantità minima di sostanza da esaminare per il procedimento analitico;
- della limitazione della concentrazione ad un massimo di 0,01 moli/l per ognuna delle due fasi.

Si eseguono tre determinazioni. Nella prima, si usa il rapporto in volume calcolato di n-ottanolo ad acqua; nella seconda, questo rapporto viene diviso per due; e nella terza questo rapporto viene moltiplicato per due (p. es. 1:1, 1:2, 2:1).

1.6.2.1.3. Sostanza da esaminare

Si prepara una soluzione di riserva in n-ottanolo presaturato con acqua. La concentrazione di questa soluzione di riserva deve essere determinata con precisione prima di impiegarla nella determinazione del coefficiente di ripartizione. Questa soluzione deve essere conservata in condizioni che assicurino la sua stabilità.

1.6.2.2. Condizioni sperimentali

La temperatura della determinazione deve essere mantenuta costante ($\pm 1^\circ\text{C}$) ed essere compresa nell'intervallo 20-25 $^\circ\text{C}$.

1.6.2.3. Procedimento di misura

1.6.2.3.1. Raggiungimento dell'equilibrio di ripartizione

Per ciascuna condizione sperimentale si devono preparare in doppio i recipienti contenenti la quantità richiesta dei due solventi, esattamente misurata, insieme all'opportuna quantità della soluzione di riserva.

Le fasi in n-ottanolo devono essere misurate in volume. I recipienti per la determinazione devono essere collocati in un opportuno agitatore o essere agitati manualmente. Un metodo raccomandato è quello di fare ruotare rapidamente di 180° la provetta da centrifuga intorno al suo asse trasversale in modo che l'eventuale aria intrappolata risalga attraverso le due fasi. L'esperienza ha mostrato che 50 rotazioni così effettuate sono in generale sufficienti per raggiungere l'equilibrio di ripartizione. Per sicurezza sono raccomandate 100 rotazioni in 5 minuti.

1.6.2.3.2. Separazioni delle fasi

Quando è necessario, allo scopo di separare le fasi si deve effettuare una centrifugazione della miscela. Ciò dovrebbe essere fatto mediante una centrifuga da laboratorio mantenuta a temperatura ambiente o, se si usa una centrifuga non termostata, le provette da centrifuga devono essere riequilibrate alla temperatura di determinazione per almeno 1 ora prima dell'analisi.

1.6.2.4. Analisi

Per la determinazione del coefficiente di ripartizione è necessario misurare la concentrazione della sostanza in esame in ambedue le fasi. Ciò può essere fatto prelevando un'aliquota di entrambe le fasi da ciascuna provetta per ciascuna condizione sperimentale ed analizzando ciascuna aliquota mediante il procedimento prescelto. La quantità totale delle sostanze presenti in ambedue le fasi deve essere calcolata e confrontata con la quantità della sostanza inizialmente introdotta.

Il prelievo di un campione della fase acquosa va eseguito con un procedimento che renda minimo il rischio di inclusione di tracce di n-ottanolo, a tal fine si può impiegare una siringa in vetro con ago asportabile. All'inizio, la siringa deve essere parzialmente riempita d'aria. L'aria deve essere espulsa cautamente mentre si inserisce l'ago attraverso lo strato di ottanolo. Si aspira nella siringa un adeguato volume di fase acquosa. Si toglie rapidamente la siringa dalla soluzione e si rimuove l'ago. Il contenuto della siringa può quindi essere impiegato come campione della fase acquosa. La concentrazione nelle due fasi separate va determinata preferibilmente attraverso un metodo specifico per la sostanza. Esempi di determinazioni chimico-fisiche che possono essere adatte sono i seguenti:

- metodi fotometrici,
- gascromatografia,
- cromatografia liquida ad alte prestazioni

1.6.3 Metodo HPLC

1.6.3.1 Preparazione

Apparecchiatura

È necessario un cromatografo liquido equipaggiato con pompa esente da pulsazioni e con un adatto dispositivo di rivelazione. Si raccomanda di usare una valvola di iniezione con serbatoi di iniezione. La presenza di gruppi polari nella fase stazionaria può peggiorare gravemente le prestazioni della colonna HPLC. Pertanto, le fasi stazionarie devono contenere una percentuale minima di gruppi polari (11). Si possono usare riempimenti commerciali a fase inversa a microparticelle o colonne preimpaccate. Si può posizionare una colonna di protezione tra il sistema di iniezione e la colonna analitica.

Fase mobile

Per preparare il solvente di eluizione si usano metanolo per HPLC e acqua per HPLC e il solvente viene degassato prima dell'uso. Si deve ricorrere all'eluizione isocratica. Si devono usare rapporti metanolo/acqua con un contenuto minimo d'acqua del 25%. Normalmente, una miscela metanolo-acqua 3:1 (v/v) è soddisfacente per eluire composti con $\log P$ 6 in un'ora ad una portata di 1 ml/min. Per composti con $\log P$ elevato, può essere necessario abbreviare il tempo di eluizione (e quello dei composti di riferimento) diminuendo la polarità della fase mobile oppure la lunghezza della colonna.

Sostanze con solubilità molto bassa in n-ottanolo tendono a fornire dei valori anormalmente bassi di $\log P_{0.1}$ con il metodo HPLC, i picchi di tali composti accompagnano talvolta il fronte del solvente. Ciò è probabilmente dovuto al fatto che il processo di ripartizione è troppo lento perché raggiunga l'equilibrio nel tempo normalmente richiesto da una separazione mediante HPLC. Una diminuzione del flusso e/o una diminuzione del rapporto metanolo/acqua può essere efficace per arrivare ad un valore affidabile.

Il composto in esame e i composti di riferimento devono essere solubili nella fase mobile in concentrazioni sufficienti per permetterne la rivelazione. Solo in casi eccezionali si possono usare degli additivi con la miscela metanolo-acqua perché questi modificano le proprietà della colonna. Per i cromatografi con additivi, è obbligatorio usare una colonna separata dello stesso tipo. Se la miscela metanolo-acqua non è appropriata, si possono usare altre miscele solvente organico-acqua, per esempio etanolo-acqua o acetonitrile-acqua.

Il pH dell'eluente è critico per i composti ionizzabili. Esso deve rientrare nel campo operativo di pH della colonna, che di solito è compreso tra 2 e 8. Si raccomanda di tamponare la soluzione. Occorre aver cura di evitare la precipitazione di sali e il deterioramento della colonna che si verificano con alcune miscele di fase organica/tampone. Le misure mediante HPLC con fasi stazionarie a base di silice al di sopra di pH 8 non sono consigliabili perché l'uso di una fase mobile alcalina può provocare un rapido scadimento delle prestazioni della colonna.

Soluti

I composti di riferimento devono essere i più puri disponibili. I composti da usare a scopo di prova o di taratura devono, se possibile, essere disciolti nella fase mobile.

Condizioni sperimentali

La temperatura durante le misure non deve variare di oltre ± 2 K.

1 6.3.2 Misure

Calcolo del tempo morto t_0

Il tempo morto t_0 può venire determinato usando o una serie omologa di sostanze (per esempio n-alchilmercaptani o composti organici non trattenuti (per esempio tiourea o formammide). Per il calcolo del tempo morto t_0 mediante l'uso di una serie omologa, si inietta una successione di almeno 7 elementi di una serie omologa e si determinano i rispettivi tempi di ritenzione. I tempi di ritenzione grezzi $t_{r(n_c+1)}$ sono riportati in grafico in funzione di $t_{r(n_c)}$, determinano la intercetta a e il coefficiente angolare b della equazione di regressione

$$t_{r(n_c+1)} = a + b t_{r(n_c)}$$

(n_c = numero di atomi di carbonio) Il tempo morto t_0 è rappresentato allora da

$$t_0 = a / (1 - b)$$

Grafico di taratura

La fase successiva consiste nella costruzione di un tracciato di correlazione di $\log k$ contro $\log P$ per appropriati composti di riferimento. Nella pratica, si effettua la determinazione su un gruppo di 5-10 composti standard di riferimento, il cui $\log P$ cade nei dintorni dell'intervallo previsto, iniettandoli simultaneamente ed effettuando preferibilmente la determinazione con un registratore integratore collegato al sistema di rivelazione. I logaritmi dei fattori di capacità corrispondenti, $\log k$, vengono calcolati e riportati sul tracciato in funzione del $\log P$ determinato mediante il metodo del dibattimento in pallone. La taratura viene eseguita a intervalli regolari ed almeno una volta al giorno, in modo da tenere conto di possibili variazioni delle prestazioni della colonna.

Determinazioni del fattore di capacità della sostanza in esame

La sostanza in esame viene iniettata nella più piccola quantità possibile di fase mobile. Viene determinato il tempo di ritenzione (in doppio) e questo permette il calcolo del fattore di capacità k . Dal grafico di correlazione dei composti di riferimento, si può interpolare il coefficiente di ripartizione della sostanza in esame. Per coefficienti di ripartizione sia molto bassi che molto elevati è necessario ricorrere alla estrapolazione. In tali casi bisogna porre particolare attenzione ai limiti di validità della retta di regressione.

2 DATI

Metodo del dibattimento in pallone

L'affidabilità dei valori di P determinati può essere controllata confrontando le medie delle determinazioni in doppio con la media globale.

3 RELAZIONE

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- indicazione precisa della sostanza (identità e impurezze),
- quando i metodi non siano applicabili (per esempio materiale tensioattivo), deve essere fornito un valore calcolato o una stima basata sulle singole solubilità in n-ottanolo e acqua,
- ogni informazione e osservazione significativa per l'interpretazione dei risultati, in particolare per quanto riguarda le impurezze e lo stato fisico della sostanza.

Per il metodo del dibattito in pallone

- il risultato dell'eventuale stima preliminare,
- la temperatura di determinazione,
- i dati sui procedimenti analitici impiegati per determinare le concentrazioni,
- il tempo e la velocità di centrifugazione, se quest'ultima è stata applicata,
- le concentrazioni misurate in ambedue le fasi per ciascuna determinazione (ciò significa che dovrà essere riportato un totale di 12 concentrazioni),

- il peso della sostanza in esame, il volume di ciascuna fase impiegata in ciascun recipiente di prova e la quantità totale calcolata della sostanza in esame presente in ciascuna fase dopo equilibrage;
- i valori calcolati per il coefficiente di ripartizione (P), e le medie per ciascuna serie di condizioni sperimentali, nonché la media per tutte le determinazioni. Se esiste il sospetto di una dipendenza dalla concentrazione del coefficiente di ripartizione, ciò va menzionato nella relazione;
- la deviazione standard dei singoli valori di P rispetto alla loro media;
- il valore medio di P risultante da tutte le determinazioni deve pure essere espresso come logaritmo (base 10);
- il valore teorico calcolato per P_{00} quando esso è stato determinato o quando il valore misurato è $> 10^4$;
- il pH dell'acqua impiegata e della fase acquosa durante l'esperimento;
- se vengono usati dei tamponi, giustificazione del loro uso al posto dell'acqua, composizione, concentrazione e pH dei tamponi, pH della fase acquosa prima e dopo l'esperimento.

Per il metodo HPLC:

- il risultato dell'eventuale stima preliminare;
- sostanze in esame e di riferimento e loro purezza;
- intervallo di temperatura delle determinazioni;
- pH al quale vengono effettuate le determinazioni;
- dettagli relativi alla colonna analitica e di protezione, alla fase mobile e al dispositivo di rivelazione;
- dati di ritenzione e valori di $\log P$ desunti dalla letteratura per i composti di riferimento usati nella taratura;
- dettagli della curva di regressione risultante ($\log k$ contro $\log P$);
- dati di ritenzione media e valore interpolato di $\log P$ per il composto in esame;
- descrizione dell'apparecchiatura e delle condizioni operative;
- profili di eluizione;
- quantità delle sostanze in esame e di riferimento introdotte nella colonna;
- tempo morto e metodo secondo il quale questo è stato misurato.

Appendice I

Metodi di calcolo/stima

INTRODUZIONE

Un'introduzione generale ai metodi di calcolo, dati ed esempi si trova nello Handbook of Chemical Property Estimation Methods (a)

I valori calcolati di P_{oa} possono essere usati

- per decidere quale dei metodi sperimentati sia appropriato (intervallo del metodo di dibattimento in pallone: $\log P_{oa}$ da -2 a 4, intervallo del metodo in HPLC $\log P_{oa}$ da 0 a 6),
- per scegliere le condizioni sperimentali appropriate (per esempio, sostanze di riferimento per i procedimenti HPLC, rapporto in volume n-ottanolo/acqua per il metodo del dibattimento in pallone),
- come verifica interna di laboratorio per possibili errori sperimentali,
- per ottenere una stima di P_{oa} nei casi in cui i metodi sperimentali non possano essere applicati per ragioni tecniche

METODO DI STIMA

Stima preliminare del coefficiente di ripartizione

Il valore del coefficiente di ripartizione può essere stimato mediante l'uso delle solubilità della sostanza in esame nei solventi puri

a tale scopo

$$P_{\text{stimato}} = \frac{C_{\text{n-ottanolo}} \text{ alla saturazione}}{C_{\text{acqua}} \text{ alla saturazione}}$$

METODI DI CALCOLO

Principio dei metodi di calcolo

Tutti i metodi di calcolo sono basati sulla frammentazione formale della molecola in sottostrutture adatte per le quali sono noti incrementi di $\log P_{oa}$ affidabili. Il $\log P_{oa}$ della molecola intera viene poi calcolato come somma dei valori corrispondenti dei suoi frammenti più la somma di termini di correzione per le interazioni intramolecolari

Sono disponibili elenchi delle costanti di frammentazione e dei termini di correzione (b) (c) (d) (e). Alcuni di questi vengono regolarmente aggiornati (b).

Criteri di qualità

In generale, l'affidabilità del metodo di calcolo diminuisce al crescere della complessità del composto in esame. Nel caso di molecole semplici di basso peso molecolare e con uno o due gruppi funzionali, ci si può attendere una deviazione da 0,1 a 0,3 unità di $\log P_{oa}$ tra i risultati dei metodi di frammentazione e il valore misurato. Nel caso di molecole più complesse, il margine d'errore può essere più grande. Questo dipenderà dalla affidabilità e disponibilità delle costanti dei frammenti, nonché dalla capacità di riconoscere le interazioni intramolecolari (per esempio i legami idrogeno) e dall'uso corretto dei termini di correzione (problema di non facile soluzione utilizzando un elaboratore di calcolo e il programma CLOGP-3) (b). Nel caso di composti che si ionizzano, è importante considerare correttamente la carica e il grado di ionizzazione.

Procedure di calcolo

Metodo del π di Hansch

La costante del sostituito idrofobo originale, π , introdotta da Fujita et al. (f) è definita come:

$$\pi_x = \log P_{oa}(\text{PhX}) - \log P_{oa}(\text{PhH})$$

dove $P_{oa}(\text{PhX})$ è il coefficiente di ripartizione di un derivato aromatico e $P_{oa}(\text{PhH})$ quello del composto capostipite

$$\begin{aligned} (\text{p. es. } \pi_{Cl} &= \log P_{oa}(\text{C}_6\text{H}_5\text{Cl}) - \log P_{oa}(\text{C}_6\text{H}_6) \\ &= 2,84 - 2,13 = 0,71) \end{aligned}$$

Secondo la sua definizione, il metodo del π può essere applicato principalmente per la sostituzione aromatica. Valori di π per un gran numero di sostituenti sono stati tabulati in (b) (c) (d). Essi vengono usati per il calcolo di $\log P_{oa}$ di molecole o sottostrutture aromatiche.

Metodo di Rekker

Secondo Rekker (g), il valore di $\log P_{oa}$ viene calcolato come segue:

$$\log P_{oa} = \sum_i a_i f_i + \sum_j (\text{termini di interazione})$$

dove f_i rappresenta la costante dei differenti frammenti molecolari e a_i la frequenza con cui essi si presentano nella molecola in esame. I termini di correzione possono essere espressi come multiplo intero di una costante singola C_m (la cosiddetta «costante magica»). Le costanti di frammento f_i e C_m sono state ricavate da un elenco di 1 054 valori sperimentali di P_{oa} (825 composti) utilizzando l'analisi di regressione multipla (c) (h). La determinazione dei termini di interazione viene eseguita secondo regole fisse descritte in letteratura (e) (h) (i).

Metodo di Hansch-Leo

Secondo Hansch e Leo (c), il valore di $\log P_{oa}$ si calcola dalla relazione:

$$\log P_{oa} = \sum_i a_i f_i + \sum_j b_j F_j$$

in cui f_i rappresenta la costante per differenti frammenti molecolari, F_j il termine di correzione e a_i , b_j le corrispondenti frequenze con cui essi si presentano. Una serie di valori di frammenti costituiti da atomi e gruppi e una serie di termini di correzione F_j (i cosiddetti «fattori») sono stati determinati per approssimazioni successive derivandoli da valori sperimentali di P_{oa} . I termini di correzione sono stati ordinati in varie classi (a) (c). È relativamente complicato e lungo tener conto di tutte le regole e dei termini di correzione. Sono stati sviluppati a tale scopo dei pacchetti di programma (b).

Metodo combinato

Il calcolo del $\log P_{oa}$ di molecole complesse può venire migliorato considerevolmente se la molecola viene divisa in strutture più semplici per le quali sono disponibili valori affidabili di $\log P_{oa}$ ottenuti o da tabelle (b) (c) o da proprie misure. Tali frammenti (p. es. sostanze eterocicliche, antrachinoni, azobenzene) possono poi venire combinati con i valori di π di Hansch o con le costanti di frammento di Rekker o Leo.

Osservazioni

- i) I metodi di calcolo possono essere applicati a composti parzialmente o completamente ionizzati solo quando è possibile tener conto dei necessari fattori di correzione.
- ii) Se si può assumere che vi siano dei legami idrogeno intramolecolari, i corrispondenti termini di correzione (approssimativamente da +0,6 a +1,0 unità di $\log P_{oa}$) devono venire aggiunti (a). Indicazioni della presenza di tali legami si possono ottenere da modelli tridimensionali o da dati spettroscopici della molecola.
- iii) Se sono possibili varie forme tautomere, si deve assumere come base di calcolo la forma più probabile.
- iv) È opportuno seguire con attenzione le revisioni degli elenchi delle costanti di frammento.

Relazione

Quando si utilizzano metodi di calcolo/stima, la relazione deve, se possibile, includere le seguenti informazioni:

- descrizione della sostanza (miscela, impurezze, e così via);
- indicazione di ogni possibile legame idrogeno intramolecolare, dissociazione, carica e altri effetti insoliti (per esempio tautomeria);
- descrizione del metodo di calcolo;
- identificazione o fornitura della base di dati;
- peculiarità della scelta dei frammenti;
- documentazione completa del calcolo.

A.9. PUNTO D'INFIAMMABILITÀ

1 METODO

1.1 INTRODUZIONE

Prima di procedere all'esecuzione della prova sarà utile disporre di informazioni preliminari sulla infiammabilità della sostanza. Il metodo è applicabile a sostanze liquide i cui vapori possono infiammarsi mediante sorgenti di accensione. I metodi sperimentali elencati in questo testo sono affidabili solo per gli intervalli del punto di infiammabilità specificati nei singoli metodi.

Quando si sceglie il metodo da usare, bisogna considerare la possibilità di reazioni chimiche tra la sostanza e il porta campioni.

1.2 DEFINIZIONI E UNITÀ

Il punto di infiammabilità è la temperatura più bassa, corretta alla pressione di 101,325 kPa, alla quale un liquido sviluppa vapori, nelle condizioni definite nel metodo sperimentale, in quantità tali da produrre una miscela vapore/aria infiammabile nel recipiente di prova.

unità °C

$$t = T - 273,15$$

(t in °C e T in K)

1.3 SOSTANZE DI RIFERIMENTO

Non è necessario utilizzare sostanze di riferimento ogni volta che si esamina una nuova sostanza. Esse servono principalmente per controllare periodicamente la precisione del metodo e per permettere il confronto con risultati ottenuti mediante altri metodi.

1.4 PRINCIPIO DEL METODO

La sostanza viene posta in un recipiente di prova e riscaldata o raffreddata alla temperatura sperimentale secondo la procedura descritta nei singoli metodi sperimentali. Vengono eseguite delle prove di accensione allo scopo di accertare se il campione si infiamma o non si infiamma alla temperatura di prova.

1.5 CRITERI DI QUALITÀ

1.5.1 Ripetibilità

La ripetibilità varia secondo l'intervallo del punto di infiammabilità e secondo il metodo sperimentale usato, massimo 2 °C.

1.5.2 Sensibilità

La sensibilità dipende dal metodo sperimentale applicato.

1.5.3 Specificità

La specificità di alcuni metodi sperimentali è limitata a particolari intervalli di punto di infiammabilità e dipende dalle caratteristiche delle sostanze (come ad esempio una elevata viscosità).

1.6 DESCRIZIONE DEL METODO

1.6.1 Preparazioni

Un campione della sostanza in esame viene posto in un apparecchio di prova in conformità a quanto indicato nei punti 1.6.3.1 e/o 1.6.3.2.

Per ragioni di sicurezza, si raccomanda di usare un metodo che utilizzi un campione di piccole dimensioni, circa 2 cm³, per le sostanze di elevato contenuto energetico o tossiche.

1.6.2. Condizioni di prova

L'apparecchio, nei limiti in cui ciò sia in linea con le esigenze di sicurezza, deve essere collocato lontano da correnti d'aria.

1.6.3. Esecuzione della prova**1.6.3.1. Metodo dell'equilibrio**

Vedi norme ISO 1516, ISO 3680, ISO 1523 e ISO 3679.

1.6.3.2. Metodo basato sul non equilibrio

Apparecchio di Abel:

Vedi norme BS 2000, parte 170, NF M07-011 e NF T66-009.

Apparecchio di Abel-Pensky:

Vedi norme EN 57, DIN 51755 — parte 1 — (per temperature comprese tra 5 °C e 65 °C) e DIN 51755 — parte 2 — (per temperature al di sotto di 5 °C), NF M07-036

Apparecchio di Tag:

Vedi norma ASTM D 56.

Apparecchio di Pensky-Martens:

Vedi norme ISO 2719, EN 11, DIN 51758, ASTM D 93, BS 2000-34 e NF M 07-019.

Osservazioni:

Quando il punto di infiammabilità, determinato mediante un metodo non di equilibrio scelto tra quelli elencati al punto 1.6.3.2, risulta essere pari a 0 ± 2 °C, 21 ± 2 °C, o 55 ± 2 °C, occorre confermarlo con un metodo all'equilibrio, utilizzando la stessa apparecchiatura.

Ai fini della notifica possono applicarsi solo i metodi che forniscono la temperatura del punto di infiammabilità.

Per determinare il punto di infiammabilità di liquidi viscosi (vernici, gomme e prodotti analoghi) contenenti solventi, possono impiegarsi soltanto apparecchiature e metodi di prova adatti alla determinazione del punto di infiammabilità di liquidi viscosi.

Vedi norme ISO 3679, ISO 3680, ISO 1523 e DIN 53213, parte 1.

2. DATI**3. RELAZIONE**

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- la descrizione precisa della sostanza (identità e impurezze presenti),
- l'indicazione del metodo impiegato e di eventuali deviazioni da esso,
- i risultati e tutte le osservazioni aggiuntive utili ai fini dell'interpretazione dei risultati.

4. BIBLIOGRAFIA

Nessuna.

A.10. INFIAMMABILITÀ (SOLIDI)

1. METODO

1.1. INTRODUZIONE

Prima di effettuare la prova sarà utile disporre di informazioni preliminari sulle eventuali proprietà esplosive della sostanza.

La presente prova dovrebbe essere applicata esclusivamente a sostanze in polvere, granulari e pastose.

Evitando di considerare tutte le sostanze capaci di infiammarsi e limitandosi soltanto a quelle che bruciano rapidamente o il cui comportamento alla combustione presenta particolari pericoli di qualsiasi genere, si considerano come facilmente infiammabili soltanto le sostanze la cui velocità di combustione supera un certo valore limite.

Può essere particolarmente pericoloso se l'incandescenza si propaga lungo una polvere metallica a motivo della difficoltà di estinguere l'incendio. Le polveri metalliche sono da considerarsi facilmente infiammabili se sostengono la diffusione dell'incandescenza attraverso la massa entro un tempo specificato.

1.2. DEFINIZIONE E UNITÀ

La velocità di combustione è espressa in secondi.

1.3. COMPOSTI DI RIFERIMENTO

Non specificati.

1.4. PRINCIPIO DEL METODO

La sostanza viene sagomata in una striscia continua o in una miccia di polvere della lunghezza di circa 250 mm e si esegue una prova preliminare orientativa per determinare se, all'accensione mediante una fiamma gassosa, si verifica la propagazione per combustione con fiamma o senza fiamma. Se entro un tempo specificato si verifica la propagazione su 200 mm della massa di campione, allora si esegue un programma completo di prova per determinare la velocità di combustione.

1.5. CRITERI DI QUALITÀ

Non definiti.

1.6. DESCRIZIONE DEL METODO

1.6.1. Prova preliminare orientativa

La sostanza viene sagomata in una striscia continua o in una miccia di polvere per una lunghezza di circa 250 mm per 20 mm di larghezza per 10 mm di altezza su una lastra di base non combustibile, non porosa e di bassa conducibilità termica. Ad una estremità della miccia in polvere si applica una fiamma di alta temperatura generata da un bruciatore a gas (diametro minimo 5 mm) fino a che la polvere si accende oppure per un massimo di 2 minuti (5 minuti per polveri di metalli o leghe metalliche). Ciò che deve essere osservato è se la combustione si propaga per 200 mm della miccia entro un tempo di prova di 4 minuti (o 40 minuti per polveri metalliche). Se la sostanza non si accende e non propaga la combustione bruciando con fiamma o senza fiamma su 200 mm della miccia di polvere entro 4 minuti (o 40 minuti) nel periodo di prova, allora la sostanza non è da considerarsi come facilmente infiammabile e non sono richieste ulteriori prove. Se la sostanza propaga la combustione per un tratto di 200 mm della miccia di polvere in meno di 4 minuti o in meno di 40 minuti per le polveri metalliche, si deve eseguire il procedimento descritto nel seguito (punto 1.6.2. e successivi).

1.6.2. Prova della velocità di combustione**1.6.2.1 Preparazione**

Le sostanze in polvere o granulari vengono introdotte in modo sfuso in uno stampo della lunghezza di 250 mm con sezione trasversale triangolare ed altezza interna di 10 mm e larghezza di 20 mm. Su ambedue i lati dello stampo, in senso longitudinale, sono montate due lastre di metallo, con la funzione di limiti laterali; esse devono sporgere di 2 mm oltre il bordo superiore della sezione triangolare (vedi figura). Lo stampo viene poi lasciato cadere per tre volte su una superficie solida, dall'altezza di 2 cm. Se necessario, lo stampo viene nuovamente riempito. I limiti laterali vengono poi rimossi e la sostanza in eccesso viene asportata. Sopra allo stampo si pone una piastra non combustibile, non porosa e con una bassa conducibilità termica che funge da piastra di base, si rovescia l'apparecchio e si rimuove lo stampo.

Le sostanze pastose sono sparse su una piastra di base non combustibile, non porosa e di bassa conducibilità termica in forma di un cordone della lunghezza di 250 mm con una sezione trasversale di circa 1 cm².

1.6.2.2. Condizioni sperimentali

Nel caso di una sostanza sensibile all'umidità, la prova deve essere effettuata con la massima rapidità possibile subito dopo aver tolto la sostanza stessa dal recipiente.

1.6.2.3 Esecuzione della prova

Disporre il campione nella corrente di una cappa per l'aspirazione dei fumi.

La velocità dell'aria deve essere sufficiente per impedire ai fumi di sfuggire verso il laboratorio e non deve venire modificata durante la prova. L'apparecchio deve essere schermato dalla corrente d'aria.

Per accendere l'ammasso ad una estremità, si utilizza una fiamma calda di un bruciatore a gas (diametro minimo 5 mm). Quando l'ammasso è bruciato per un tratto di 80 mm, si misura la velocità di combustione sui successivi 100 mm. L'esperimento viene eseguito sei volte usando ogni volta una piastra pulita e fredda, salvo che si osservi prima un risultato positivo.

2. DATI

Il tempo di combustione risultante dalla prova preliminare orientativa (1.6.1) e il minimo tempo di combustione su un massimo di sei prove (1.6.2.3) sono i dati utili ai fini della valutazione.

3. RELAZIONE**3.1. RELAZIONE SUL SAGGIO**

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- l'indicazione esatta della sostanza (identificazione e impurezze);
- una descrizione della sostanza esaminata e del suo stato fisico, incluso il contenuto di umidità;
- i risultati della prova preliminare orientativa e della prova della velocità di combustione, se eseguita;
- tutte le osservazioni aggiuntive significative ai fini dell'interpretazione dei risultati.

3.2. INTERPRETAZIONE DEI RISULTATI

Le sostanze in polvere, granulari o pastose sono da considerarsi facilmente infiammabili se il tempo di combustione in una qualunque delle prove eseguite secondo la procedura sperimentale descritta al punto 1.6.2. è minore di 45 secondi. Le polveri di metalli o leghe metalliche sono considerate facilmente infiammabili quando sono suscettibili di accensione e la fiamma o la zona di reazione si propaga sull'intero campione in 10 minuti o meno.

Appendice

Figura

Stampo e accessori per la preparazione del campione

(Tutte le dimensioni sono espresse in mm)

A.11. INFIAMMABILITÀ (GAS)

1. METODO

1.1. INTRODUZIONE

Questo metodo permette di determinare se gas miscelati con aria a temperatura ambiente (circa 20 °C) e pressione atmosferica sono infiammabili e, in tale caso, in quale intervallo di concentrazioni. Miscele a concentrazioni crescenti del gas in esame con l'aria vengono esposte a una scintilla elettrica e si osserva se ha luogo l'accensione.

1.2. DEFINIZIONE E UNITÀ

L'intervallo d'infiammabilità è l'intervallo di concentrazione compreso fra il limite minimo e il limite massimo di esplosione. I limiti minimo e massimo di esplosione sono quei limiti di concentrazione del gas infiammabile in miscela con l'aria ai quali non si verifica la propagazione della fiamma.

1.3. SOSTANZE DI RIFERIMENTO

Non specificate

1.4. PRINCIPIO DEL METODO

La concentrazione del gas nell'aria viene aumentata gradualmente e ad ogni livello di concentrazione la miscela viene esposta ad una scintilla elettrica.

1.5. CRITERI DI QUALITÀ

Non stabiliti

1.6. DESCRIZIONE DEL METODO

1.6.1. Apparecchiatura

Il recipiente di prova è costituito da un cilindro verticale di vetro con un diametro interno di almeno 50 mm ed una altezza di 300 mm. Gli elettrodi di accensione, separati da una distanza di 3-5 mm, sono collocati 60 mm al di sopra del fondo del cilindro. Il cilindro è provvisto di un'apertura per lo sfogo della pressione. L'apparecchio deve essere schermato in modo da limitare gli eventuali danni dovuti ad esplosione.

Come fonte di accensione si impiega una scintilla ad induzione permanente della durata di 0,5 sec., generata da un trasformatore ad alto voltaggio con una tensione di uscita compresa fra 10 e 15 kV (potenza massima di entrata: 300 W). Un esempio di un apparecchio adatto è descritto nel riferimento bibliografico (2).

1.6.2. Condizioni sperimentali

La prova deve essere eseguita a temperatura ambiente (circa 20 °C).

1.6.3. Esecuzione della prova

Usando pompe dosatrici, si introduce nel cilindro di vetro una miscela gas — aria di concentrazione nota. Si fa passare una scintilla attraverso la miscela e si osserva se si stacca o no dalla fonte di accensione una fiamma che si propaga indipendentemente. La concentrazione del gas viene variata per incrementi dell'1 % in volume fino a quando si verifica l'accensione sopra descritta.

Se la struttura chimica del gas indica che esso non dovrebbe essere infiammabile e si può calcolare la composizione della miscela stechiometrica con aria, si effettua allora la prova solo su miscele nell'intervallo dal 10 % al di sotto della composizione stechiometrica al 10 % al di sopra di questa composizione in incrementi dell'1 %.

2. DATI

La propagazione della fiamma è l'unico fenomeno significativo per la determinazione di questa proprietà.

3. RELAZIONE

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- la descrizione esatta della sostanza (identità e impurezze presenti),
- la descrizione dell'apparecchiatura utilizzata con l'indicazione delle dimensioni,
- la temperatura alla quale la prova è stata eseguita,
- le diverse concentrazioni impiegate e i risultati ottenuti,
- il risultato della prova: gas non infiammabile o gas facilmente infiammabile,
- se si conclude che il gas non è infiammabile, si deve allora dichiarare l'intervallo di concentrazioni nel quale esso è stato provato in incrementi dell'1 %;
- tutte le informazioni e osservazioni significative per l'interpretazione dei risultati.

4. BIBLIOGRAFIA

A.12. INFIAMMABILITÀ (Contatto con l'acqua)

1 METODO

1.1. INTRODUZIONE

Questo metodo sperimentale può essere usato per determinare se la reazione di una sostanza con acqua o aria umida porta allo sviluppo di quantità pericolose di gas che possono essere facilmente infiammabili.

Il metodo è applicabile alle sostanze solide e liquide. Questo metodo non è applicabile a sostanze che si infiammano spontaneamente a contatto con l'aria.

1.2. DEFINIZIONI E UNITÀ

Facilmente infiammabili: sostanze che, a contatto con l'acqua o con l'aria umida, sviluppano gas facilmente infiammabili in quantità pericolose ad una velocità minima di 1 litro/kg per ora.

1.3. PRINCIPIO DEL METODO

La sostanza viene saggiata secondo il procedimento per gradi descritto nel seguito; se ad uno qualsiasi dei livelli si verifica l'accensione, non è necessario proseguire nella prova. Se è noto che la sostanza non reagisce violentemente con l'acqua, procedere allora al livello 4 (1.3.4).

1.3.1. Livello 1

La sostanza in esame viene versata in un recipiente contenente acqua distillata a 20 °C e si osserva se il gas sviluppato si infiamma o meno.

1.3.2. Livello 2

La sostanza in esame viene posta su un foglio di carta da filtro galleggiante sulla superficie di un recipiente contenente acqua distillata a 20 °C e si osserva se il gas sviluppato si infiamma o meno. La carta da filtro ha semplicemente la funzione di evitare la dispersione della sostanza in acqua, aumentando così le possibilità di accensione.

1.3.3. Livello 3

La sostanza in esame viene disposta in forma approssimativamente cilindrica di circa 2 cm di altezza e 3 cm di diametro. Si aggiungono alcune gocce di acqua e si osserva se il gas sviluppato si infiamma.

1.3.4. Livello 4

La sostanza in esame viene mescolata con acqua distillata a 20 °C e si misura la velocità di sviluppo del gas per un periodo di 7 ore ad intervalli di un'ora. Se la velocità di formazione del gas non è costante, o è ancora in aumento dopo 7 ore, si deve prolungare il tempo di misurazione fino ad un massimo di 5 giorni. La prova può essere sospesa in qualsiasi momento se la velocità di sviluppo del gas supera 1 l/kg per ora.

1.4. SOSTANZA DI RIFERIMENTO

Non specificata.

1.5. CRITERI DI QUALITÀ

Non stabiliti.

1.6. DESCRIZIONE DEI METODI

1.6.1. Livello 1

1.6.1.1. Condizioni di prova

La prova va eseguita a temperatura ambiente (circa 20 °C).

1.6.1.2. Esecuzione della prova

Una piccola quantità (2 mm circa di diametro) della sostanza da esaminare viene posta in un recipiente contenente acqua distillata. Si deve osservare: (i) se si ha sviluppo di gas; (ii) se si verifica l'accensione del gas. Se si verifica l'accensione del gas, non sono necessarie ulteriori prove, poiché la sostanza deve essere considerata pericolosa.

1.6.2. Livello 2

1.6.2.1. Apparecchiatura

Un foglio di carta da filtro viene fatto galleggiare sulla superficie di acqua distillata contenuta in un qualsiasi recipiente idoneo, per esempio una capsula da evaporazione del diametro di 100 mm.

1.6.2.2. Condizioni di prova

La prova va eseguita a temperatura ambiente (circa 20 °C).

1.6.2.3. Esecuzione della prova

Una piccola quantità della sostanza in esame (2 mm circa di diametro) viene posta al centro del foglio di carta da filtro. Si deve osservare: (i) se si ha sviluppo di gas; (ii) se si verifica l'accensione del gas. Se si verifica l'accensione del gas, non sono necessarie ulteriori prove, poiché la sostanza deve essere considerata pericolosa.

1.6.3. Livello 3

1.6.3.1. Condizioni di prova

La prova deve essere eseguita a temperatura ambiente.

1.6.3.2. Esecuzione della prova

La sostanza da esaminare viene disposta in forma approssimativamente cilindrica di circa 2 cm d'altezza e 3 cm di diametro, con una leggera concavità sulla cima. Si aggiungono alcune gocce di acqua e si osserva: (i) se si ha sviluppo di gas; (ii) se si verifica l'accensione del gas. Se si verifica l'accensione del gas, non sono necessarie ulteriori prove, poiché la sostanza deve essere considerata pericolosa.

1.6.4. Livello 4

1.6.4.1. Apparecchiatura

L'apparecchiatura viene montata come mostrato in figura.

1.6.4.2. Condizioni di prova

Controllare il contenitore della sostanza da esaminare per accertare l'eventuale presenza di polveri al di sotto di 500 μm (dimensioni delle particelle). Se il contenuto in polvere supera l'1% (p/p) del totale, o se il campione è friabile, tutta la sostanza deve essere ridotta in polvere prima della prova, per tener conto della riduzione di formato delle particelle durante l'immagazzinamento e la manipolazione; in caso contrario, la sostanza deve essere saggiata così come ricevuta. La prova deve essere eseguita a temperatura ambiente (circa 20 °C) e a pressione atmosferica.

1.6.4.3 Esecuzione della prova

Si introducono da 10 a 20 ml d'acqua nel contagocce dell'apparecchiatura e 10 g di sostanza nella beuta. Il volume del gas sviluppato può essere misurato mediante qualsiasi mezzo opportuno. L'imbuto del contagocce viene aperto per immettere l'acqua nella beuta e si avvia un cronometro. Lo sviluppo del gas viene misurato ogni ora per un periodo di 7 ore. Se durante questo periodo lo sviluppo del gas è irregolare o se, al termine di questo periodo, la velocità di sviluppo del gas è in aumento, le misure devono essere continuate fino a 5 giorni. Se in qualunque momento durante la misura la velocità di sviluppo del gas è superiore a 1 l/kg per ora, la prova può essere interrotta. La prova va eseguita in triplo.

Se l'identità chimica del gas è sconosciuta, il gas deve essere analizzato. Quando il gas contiene componenti facilmente infiammabili e non si sa se l'intera miscela sia facilmente infiammabile, si deve preparare e saggiare secondo il metodo A.11 una miscela avente la stessa composizione.

2. DATI

La sostanza viene considerata pericolosa se:

- a qualsiasi livello della procedura sperimentale si verifica l'accensione spontanea;
o
- avviene uno sviluppo di gas infiammabile ad una velocità maggiore di 1 l/kg della sostanza per ora.

3. RELAZIONE

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- l'indicazione precisa della sostanza (identificazione e impurezze);
- dettagli dell'eventuale preparazione iniziale della sostanza in esame;
- i risultati delle prove (livelli 1, 2, 3 e 4);
- l'identità chimica del gas sviluppato;
- la velocità di sviluppo del gas se viene eseguito il livello 4 (1.6.4);
- ogni ulteriore osservazione significativa ai fini dell'interpretazione dei risultati.

Apparecchiatura

A.13. PROPRIETÀ PIROFORICHE DI SOLIDI E LIQUIDI

1 METODO

1.1 INTRODUZIONE

La procedura sperimentale può essere applicata a sostanze solide o liquide che, in piccole quantità, si accendano spontaneamente poco tempo dopo essere venute in contatto con l'aria a temperatura ambiente (circa 20 °C)

Questo metodo di prova non considera le sostanze che devono essere esposte all'aria per ore o giorni a temperatura ambiente o a temperature elevate prima che si verifichi l'accensione

1.2 DEFINIZIONI E UNITÀ

Si considera che una sostanza presenti proprietà piroforiche se si accende o carbonizza nelle condizioni descritte in 1.6

Può anche essere necessario controllare l'autoinfiammabilità dei liquidi usando il metodo A.15 (Temperatura di autoaccensione liquidi e gas)

1.3 SOSTANZE DI RIFERIMENTO

Non specificata

1.4 PRINCIPIO DEL METODO

La sostanza solida o liquida viene aggiunta ad un veicolo inerte e portata in contatto con aria a temperatura ambiente per un periodo di 5 minuti. Se le sostanze liquide non si accendono, esse vengono assorbite su carta da filtro ed esposte all'aria a temperatura ambiente (circa 20 °C) per 5 minuti. Se un solido o un liquido si infiammano, o se un liquido provoca l'accensione o la carbonizzazione della carta da filtro, la sostanza è considerata piroforica

1.5 CRITERIO DI QUALITÀ

Ripetibilità per motivi di sicurezza, un singolo risultato positivo è sufficiente perché la sostanza sia considerata piroforica

1.6 DESCRIZIONE DEL METODO DI PROVA

1.6.1 Apparecchiatura

Una capsula di porcellana del diametro di circa 10 cm viene riempita con farina di diatomee per un'altezza di circa 5 mm a temperatura ambiente (circa 20 °C)

Nota

La farina di diatomee, o qualsiasi altra sostanza inerte paragonabile facilmente reperibile, sarà considerata rappresentativa di un suolo su cui può riversarsi, in caso di incidente, la sostanza in esame

Per l'analisi di liquidi che non si accendono a contatto con l'aria quando siano in contatto con un veicolo inerte, è necessaria carta da filtro asciutta

1.6.2. Esecuzione della prova

a) *Solidi in polvere*

Da 1 a 2 cm³ della sostanza in polvere da esaminare vengono versati da un'altezza di circa 1 m su una superficie non combustibile e si osserva se la sostanza si infiamma durante la caduta o entro 5 minuti dopo la caduta.

La prova viene eseguita fino a quando si verifica l'accensione, per un massimo di 6 volte.

b) *Liquidi*

Circa 5 cm³ del liquido in esame vengono versati nella capsula di porcellana preparata e si osserva se la sostanza si infiamma entro 5 minuti.

Se nelle 6 prove non si verifica accensione, eseguire le prove seguenti:

un campione da 0,5 ml viene applicato mediante siringa su una carta da filtro dentellata e si osserva se avviene l'accensione o la carbonizzazione della carta da filtro entro 5 minuti dall'aggiunta del liquido. La prova viene eseguita fino a quando si verifica l'accensione o la carbonizzazione, per un massimo di tre volte.

2. DATI

2.1. TRATTAMENTO DEI RISULTATI

La prova può essere interrotta non appena si verifici un risultato positivo in una qualunque delle prove.

2.2. VALUTAZIONE

Se la sostanza si accende entro 5 minuti da quando viene aggiunta ad un veicolo inerte ed esposta all'aria, oppure se una sostanza liquida carbonizza o provoca l'accensione di una carta da filtro entro 5 minuti da quando è stata aggiunta ed esposta all'aria, tale sostanza viene considerata piroforica.

3. RELAZIONE

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- l'indicazione precisa della sostanza (identificazione e impurezze);
- i risultati delle prove;
- ogni ulteriore osservazione significativa ai fini dell'interpretazione dei risultati.

4. BIBLIOGRAFIA

- (1) NF T 20-039 (SEPT 85). Chemical products for industrial use. Determination of the spontaneous flammability of solids and liquids.
- (2) Recommendations on the Transport of Dangerous Goods, Test and criteria, 1990, United Nations, New York.

A.14. PROPRIETÀ ESPLOSIVE

1. METODO

1.1. INTRODUZIONE

Il metodo fornisce uno schema di prove per determinare se una sostanza solida o pastosa presenti un pericolo di esplosione quando viene sottoposta all'effetto di una fiamma (sensibilità termica) o ad urti o sfregamenti (sensibilità agli stimoli meccanici) e se una sostanza liquida presenti un pericolo di esplosione quando viene sottoposta all'effetto di una fiamma o di un urto.

Il metodo comprende tre parti:

- a) una prova di sensibilità termica (1);
- b) una prova di sensibilità meccanica relativa agli urti (1);
- c) una prova di sensibilità meccanica relativa allo sfregamento (1).

Il metodo fornisce dei dati per valutare la probabilità che certe sollecitazioni comuni possano dar luogo ad una esplosione. Il metodo non è previsto per stabilire se una sostanza sia in grado di esplodere in qualsiasi condizione.

Il metodo è appropriato per determinare se una sostanza presenti un pericolo di esplosione (sensibilità termica e meccanica) nelle particolari condizioni specificate nella direttiva. Questo metodo è basato su un certo numero di tipi di apparecchi ampiamente usati a livello internazionale (1) e che danno normalmente dei risultati significativi. Si riconosce che il metodo non è definitivo. Apparecchi alternativi a quelli specificati possono essere usati purché siano internazionalmente riconosciuti e i risultati possano adeguatamente venire correlati con quelli ricavabili dall'apparecchio specificato.

Non è necessario eseguire le prove quando le informazioni termodinamiche disponibili (per esempio il calore di formazione, calore di decomposizione) e/o l'assenza di certi gruppi reattivi (2) nella formula di struttura permettano di stabilire al di là di ogni ragionevole dubbio che la sostanza non è soggetta a rapida decomposizione con sviluppo di gas o liberazione di calore (cioè che il materiale non presenta alcun rischio di esplosione). Per i liquidi non è richiesto un saggio di sensibilità allo sfregamento.

1.2. DEFINIZIONI E UNITÀ

Esplosivi:

Sostanze che possono esplodere sotto l'effetto di una fiamma o che sono sensibili agli urti o all'attrito nell'apparecchiatura specificata (o che presentano una sensibilità meccanica maggiore dello 1,3-dinitrobenzene in un apparecchio alternativo).

1.3. SOSTANZE DI RIFERIMENTO

1,3-dinitrobenzene tecnico cristallino passante un setaccio da 0,5 mm per il metodo dello sfregamento e dell'urto.

Peridro-1,3,5-trinitro-1,3,5-triazina (RDX, esogeno, ciclonite — CAS 121-82-4), ricristallizzata da cicloesano-ne acquoso, setacciata a umido attraverso un setaccio da 250 µm e trattenuta su un setaccio da 150 µm, essiccata a 103 ± 2 °C (per 4 ore) per la seconda serie di prove di sfregamento e urto.

1.4. PRINCIPIO DEL METODO

Per stabilire le condizioni di sicurezza per l'esecuzione delle tre prove di sensibilità sono necessarie delle prove preliminari.

1 4 1 Prove di sicurezza di manipolazione (3)

Per ragioni di sicurezza, prima di eseguire le prove principali campioni molto piccoli (circa 10 mg) della sostanza vengono sottoposti a riscaldamento senza restrizioni fisiche in una fiamma gassosa, ad urti in qualunque tipo di apparecchio adatto e allo sfregamento con l'impiego di un mazzuolo contro un incudine o qualsiasi altro tipo di macchina che produca attrito. Obiettivo della prova è di stabilire se la sostanza sia sensibile ed esplosiva in misura tale che le prove di sensibilità prescritte, in particolare quella della sensibilità termica, debbano essere eseguite con precauzioni particolari per evitare danni all'operatore.

1.4.2 Sensibilità termica

Il metodo prevede di riscaldare la sostanza in un tubo d'acciaio chiuso con piastre forate di differente diametro del foro per determinare se la sostanza tenda ad esplodere nelle condizioni di intensa sollecitazione termica e delimitazione spaziale definita.

1 4 3 Sensibilità meccanica (urti)

Il metodo prevede di sottoporre la sostanza all'urto di una massa specificata lasciata cadere da un'altezza specificata.

1 4 4 Sensibilità meccanica (sfregamento)

Il metodo prevede di sottoporre le sostanze solide o pastose ad attrito tra superfici standard in condizioni specificate di carico e movimento relativo.

1.5. CRITERI DI QUALITÀ

Non stabiliti

1 6 DESCRIZIONE DEL METODO

1 6 1 Sensibilità termica (effetto di una fiamma)

1 6 1 1 Apparecchiatura

L'apparecchiatura è costituita da un tubo d'acciaio non riutilizzabile con il suo dispositivo di chiusura riutilizzabile (figura 1), installato in un dispositivo di riscaldamento e protezione. Ciascun tubo è ottenuto per imbuitura da una lamiera d'acciaio (vedi appendice) e presenta un diametro interno di 24 mm, una lunghezza di 75 mm e uno spessore delle pareti di 0,5 mm. I tubi sono flangiati all'estremità aperta per permetterne la chiusura mediante la piastra forata. Questa è costituita da una piastra forata resistente alle alte pressioni, dotata di un foro centrale, saldamente fissata ad un tubo con un giunto a vite a due parti (dado e collare filettato). Il dado e il collare filettato sono in acciaio al cromo-manganese (vedi appendice) che non genera scintille fino a 800 °C. Le piastre forate hanno uno spessore di 6 mm, sono in acciaio resistente al calore (vedi appendice) e sono disponibili con aperture di vario diametro.

1 6 1 2 Condizioni di prova

Normalmente la sostanza viene controllata così come fornita, benché in certi casi, per esempio se è pressata, colata o altrimenti condensata, possa essere necessario triturlarla prima di esaminarla.

Per i solidi, la massa di materiale da usarsi in ciascuna prova viene determinata secondo un procedimento a secco in due stadi. Un tubo tarato viene riempito con 9 cm³ di sostanza e la sostanza viene compattata con una forza di 80 N applicata alla sezione trasversale totale del tubo. Per ragioni di sicurezza o nei casi in cui la forma

fisica del campione possa essere modificata per compressione, si possono usare differenti procedure di riempimento; per esempio, se la sostanza è molto sensibile all'attrito la pigiatura non è appropriata. Se il materiale è comprimibile, se ne aggiunge dell'altro e lo si pigia fino a che il tubo è riempito fino a 55 mm dal bordo. Si determina la massa totale usata per riempire il tubo fino al livello di 55 mm e se ne aggiungono due ulteriori aliquote, pigiata ciascuna con una forza di 80 N. Poi, secondo le necessità, si aggiunge ulteriore materiale pigiandolo oppure lo si toglie per lasciare il tubo riempito fino a 15 mm dal bordo. Si esegue una seconda prova a secco partendo con una quantità pigiata pari a un terzo della massa totale trovata nella prima prova a secco. Si aggiungono altre due di queste aliquote pigiandole a 80 N e il livello della sostanza nel tubo viene regolato a 15 mm dal bordo mediante l'aggiunta o la sottrazione di materiale secondo le necessità. La quantità di solido usata in ciascuna prova è quella determinata nella seconda prova a secco; il riempimento viene eseguito in tre quantità uguali, compresse ciascuna a 9 cm³ con la forza necessaria, qualunque essa sia. (Ciò può essere facilitato mediante l'uso di anelli distanziatori.)

I liquidi e i gel sono caricati nel tubo fino ad un'altezza di 60 mm ponendo particolare attenzione con i gel per impedire la formazione di vuoti. Il collare filettato viene fatto scivolare sul tubo dal basso, si inserisce l'appropriato piatto forato e si serra il dado dopo aver applicato un po' di lubrificante a base di disolfuro di molibdeno. È essenziale controllare che non vi sia sostanza intrappolata tra la flangia e la piastra né nella filettatura.

Per il riscaldamento si utilizza propano prelevato da una bombola industriale dotata di regolatore di pressione (60-70 mbar), passandolo attraverso un manometro e distribuendolo in modo uniforme (come indicato dall'osservazione visiva delle fiamme uscenti dai bruciatori) a 4 bruciatori mediante un collettore. I bruciatori sono disposti intorno alla camera di prova come mostrato in figura 1. I quattro bruciatori hanno un consumo totale di circa 3,2 litri di propano al minuto. È possibile usare gas combustibili e bruciatori alternativi, ma la velocità di riscaldamento deve essere quella specificata in figura 3. Per tutte le apparecchiature, si deve controllare periodicamente la velocità di riscaldamento con l'uso di tubi riempiti di dibutilftalato, come indicato in figura 3.

1.6.1.3. *Esecuzione delle prove*

Ciascuna prova viene eseguita fino a quando il tubo si frammenta o è stato riscaldato per 5 minuti. Una prova che dia come risultato la frammentazione del tubo in tre o più pezzi, che in alcuni casi possono essere collegati uno all'altro da sottili strisce di metallo come è illustrato in figura 2, viene valutata come esplosione. Se una prova dà come risultato un minor numero di frammenti o nessuna frammentazione, si considera che non abbia dato luogo ad esplosione.

Si esegue inizialmente una serie di tre prove con una piastra con orificio da 6,0 mm di diametro e, se non si ottengono esplosioni, si esegue una seconda serie di tre prove con una piastra avente un orificio del diametro di 2,0 mm. Se avviene un'esplosione durante una delle serie di prova non sono necessarie prove ulteriori.

1.6.1.4. *Valutazione*

Il risultato della prova è considerato positivo se si verifica un'esplosione in una delle serie di prove sopra descritte.

1.6.2. *Sensibilità meccanica (urti)*

1.6.2.1. *Apparecchiatura (figura 4)*

Le parti essenziali di una tipica apparecchiatura a martello cadente sono un blocco d'acciaio fuso con base, incudine, colonna, guide, pesi cadenti, dispositivo di rilascio e porta campione. L'incudine d'acciaio da 100 mm di diametro per 70 mm di altezza è avvitata su un blocco d'acciaio da 230 mm di lunghezza per 250 mm di larghezza per 200 mm d'altezza con una base fusa da 450 mm di lunghezza per 450 mm di larghezza per 60 mm d'altezza. Sul retro del blocco d'acciaio è avvitato un sostegno nel quale è fissata una colonna in tubo d'acciaio trafilato senza saldatura. Quattro viti ancorano l'apparecchio ad un blocco massiccio di cemento da 60 x 60 x 60 cm in modo che le guide siano assolutamente verticali e il peso cadente possa cadere liberamente. Per l'uso sono disponibili pesi di acciaio massiccio da 5 e 10 kg. La testa di impatto dei pesi è di acciaio temprato da 60 a 63 HRC e presenta un diametro minimo di 25 mm.

Il campione da esaminare viene posto in un dispositivo per prove d'urto costituito da due cilindri massicci d'acciaio coassiali e sovrapposti in un cilindro cavo d'acciaio che funge da guida. I cilindri d'acciaio massiccio devono avere un diametro di 10 ($-0,003$, $-0,005$) mm e un'altezza di 10 mm e superfici levigate, spigoli arrotondati (raggio di curvatura 0,5 mm) e una durezza HRC da 58 a 65. Il cilindro cavo deve avere un diametro esterno di 16 mm, un foro levigato di 10 ($+0,005$, $+0,010$) mm e un'altezza di 13 mm. Il dispositivo per le prove d'urto è montato su un'incudine intermedia d'acciaio (diametro 26 mm, altezza 26 mm) e centrato mediante un anello con fori di sfogo dei fumi.

1.6.2.2. Condizioni sperimentali

Il volume del campione dovrebbe essere di 40 mm³, o un volume adatto per eventuali apparecchi alternativi. Le sostanze solide dovrebbero essere provate allo stato secco e preparate come segue:

- le sostanze in polvere sono setacciate (maglie da 0,5 mm); per le prove si usa tutto il materiale passato attraverso il setaccio;
- le sostanze pressate, fuse o altrimenti condensate vengono rotte in pezzettini e setacciate. Per le prove si usa la frazione di setacciatura compresa tra 0,5 e 1 mm di diametro, e questa deve essere rappresentativa della sostanza originale.

Le sostanze che si presentano normalmente sotto forma di pasta dovrebbero essere saggiate per quanto possibile alla stato secco o comunque dopo aver rimosso la maggior quantità possibile di diluente.

1.6.2.3. Esecuzione delle prove

Si esegue una serie di 6 prove lasciando cadere la massa di 10 kg da 0,40 m (40 J). Se durante le sei prove a 40 J si ottiene un'esplosione, si deve eseguire una serie ulteriore di 6 prove lasciando cadere una massa di 5 kg da 0,15 m (7,5 J). In altri apparecchi, il campione viene confrontato con la sostanza di riferimento scelta usando una procedura di provata validità (per esempio tecnica «su e giù», ecc.).

1.6.2.4. Valutazione

Il risultato della prova viene considerato positivo se si verifica un'esplosione (l'accensione violenta e/o un colpo sono equivalenti a un'esplosione) almeno una volta in qualsiasi delle prove con l'apparecchio per prove d'urto specificato oppure se il campione è più sensibile dello 1,3-dinitrobenzene o della RDX in una prova d'urto alternativa.

1.6.3. Sensibilità meccanica (attrito)

1.6.3.1. Apparecchiatura (figura 5)

L'apparecchiatura per le prove d'attrito è costituita da una piastra di base d'acciaio fuso sulla quale è montato il dispositivo di sfregamento, costituito da una barra fissa di porcellana con una piastra mobile di porcellana. La piastra di porcellana è tenuta in una slitta che corre su due guide. La slitta è collegata ad un motore elettrico mediante un'asta di collegamento, un eccentrico e una trasmissione adatta perché la piastra di porcellana venga spostata, una sola volta, avanti e indietro sotto la barra di porcellana per un tratto di 10 mm. La barra di porcellana può essere sottoposta ad un carico per esempio di 120 o 360 newton.

Le piastre di porcellana piatte sono fatte di porcellana tecnica bianca (ruvidità da 9 a 32 µm) e hanno le seguenti dimensioni: 25 mm di lunghezza × 25 mm di larghezza × 5 mm di altezza. La barra cilindrica di porcellana è fatta anch'essa di porcellana tecnica ed ha una lunghezza di 15 mm, un diametro di 10 mm e superfici terminali sferiche irruvidite con un raggio di curvatura di 10 mm.

1.6.3.2. Condizioni sperimentali

Il volume del campione dovrebbe essere di 10 mm³ o un volume adatto ad eventuale apparecchio alternativo.

Le sostanze solide sono controllate allo stato secco e preparate come segue:

- le sostanze in polvere sono setacciate (maglie da 0,5 mm); per la prova si utilizza tutto il materiale passato attraverso il setaccio;
- le sostanze pressate, fuse o altrimenti condensate vengono rotte in pezzettini e setacciate. La frazione di setacciatura < 0,5 mm viene usata per le prove.

Le sostanze che si presentano normalmente sotto forma di pasta devono essere provate per quanto possibile allo stato secco. Se la sostanza non può essere preparata allo stato secco, la pasta (dopo rimozione della maggior quantità possibile di diluente) viene provata in forma di una pellicola da 0,5 mm di spessore, 2 mm di larghezza e 10 mm di lunghezza preparata con un attrezzo opportuno.

1.6.3.3. *Esecuzione delle prove*

La base di porcellana viene portata sul campione in esame e si applica il peso. Durante l'esecuzione della prova, la struttura spugnosa superficiale della piastra di porcellana deve giacere trasversalmente rispetto alla direzione di movimento. Bisogna fare attenzione che la barra sia appoggiata sul campione, che vi sia una quantità sufficiente di materiale in esame sotto alla barra e inoltre che la piastra si muova correttamente sotto la barra. Per le sostanze pastose si usa un calibro dello spessore di 0,5 mm con una fessura da 2×10 mm per applicare la sostanza alla piastra. La piastra di porcellana deve muoversi 10 mm avanti e indietro sotto alla barra di porcellana in un tempo di 0,44 secondi. Ciascuna parte della superficie della piastra e della barra deve essere usata una sola volta; le due estremità di ciascuna barra serviranno per due prove e le due superfici di una piastra serviranno ciascuna per tre prove.

Si esegue una serie di sei prove con un carico di 360 N. Se in queste sei prove si ottiene un evento positivo, si deve eseguire un'ulteriore serie di sei prove con un carico di 120 N. In altri apparecchi, il campione viene confrontato con la sostanza di riferimento scelta usando una procedura di provata validità (per esempio tecnica «su e giù», ecc.).

1.6.3.4. *Valutazione*

Il risultato della prova viene considerato positivo se si verifica un'esplosione (crepitio e/o una accensione violenta o una fiammata sono equivalenti ad un'esplosione) almeno una volta in una qualunque delle prove con l'apparecchio di attrito specificato o se soddisfa i criteri equivalenti in una prova di attrito alternativa.

2. **DATI**

In linea di principio, si considera che una sostanza presenti un pericolo di esplosione ai sensi della direttiva se si ottiene un risultato positivo nella prova di sensibilità termica, agli urti o all'attrito.

3. **RELAZIONE**

3.1. **RELAZIONE SUL SAGGIO**

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- identità, composizione, purezza, umidità e così via della sostanza esaminata;
- la forma fisica del campione e se esso sia o no stato macinato, triturato e/o setacciato;
- osservazioni effettuate durante le prove di sensibilità termica (per esempio massa del campione, numero di frammenti);
- osservazioni eseguite durante le prove di sensibilità meccanica (per esempio la formazione di quantità considerevoli di fumo o la decomposizione completa senza accensione violenta, fiamme, scintille, crepitii, ecc.);
- risultati di ciascun tipo di prova;
- se è stato usato un apparecchio alternativo, bisogna fornire una giustificazione scientifica e una prova della correlazione tra i risultati ottenuti con l'apparecchio specificato e quelli ottenuti con l'apparecchio equivalente;
- qualsiasi commento utile, come riferimenti a prove con prodotti simili, che possono essere significativi per una corretta interpretazione dei risultati;
- tutte le osservazioni addizionali significative per l'interpretazione dei risultati.

3.2. **INTERPRETAZIONE E VALUTAZIONE DEI RISULTATI**

La relazione di prova deve citare gli eventuali risultati considerati falsi, anormali o non rappresentativi. Se qualcuno dei risultati deve essere scartato, deve essere fornita una spiegazione e i risultati di prove alternative o complementari. I risultati anormali, salvo che essi possano venire spiegati, devono essere accettati con i valori sperimentali e usati per classificare conformemente la sostanza.

Taratura della velocità di riscaldamento per la prova di sensibilità termica

Curva temperatura/tempo ottenuta riscaldando dibutilftalato (27 cm^3) in un tubo chiuso (piastra forata da 1,5 mm) con propano ad una portata di 3,2 litri al minuto. La temperatura viene misurata con una termocoppia cromel/alumel con guaina d'acciaio inossidabile del diametro di 1 mm disposta centralmente 43 mm al di sotto del bordo del tubo. La velocità di riscaldamento tra 135°C e 285°C deve essere compresa tra 185 e 215 K/min.

A.15. TEMPERATURA DI AUTOACCENSIONE (LIQUIDI E GAS)

1 METODO

1.1 INTRODUZIONE

A questa prova non devono essere sottoposte le sostanze esplosive e le sostanze che si accendono spontaneamente per contatto con l'aria a temperatura ambiente. La procedura d'esame è applicabile a gas, liquidi e vapori che in presenza dell'aria possono essere infiammati da una superficie calda.

La temperatura di autoaccensione può essere ridotta considerevolmente dalla presenza di impurezze catalitiche, dal materiale della superficie o da un maggiore volume del recipiente di prova

1.2 DEFINIZIONI E UNITÀ

Il grado di autoinfiammabilità è espresso in termini di temperature di autoaccensione. La temperatura di autoaccensione è la temperatura minima alla quale la sostanza in esame si infiamma quando sia miscelata con aria nelle condizioni definite nel metodo di prova.

1.3 SOSTANZE DI RIFERIMENTO

Le sostanze di riferimento sono citate nelle norme (vedi 1.6.3). Queste sostanze servono principalmente per verificare periodicamente la precisione del metodo e per permettere il confronto coi risultati ottenuti mediante altri metodi.

1.4 PRINCIPIO DEL METODO

Il metodo determina la temperatura minima della superficie interna di un recipiente chiuso che dà luogo all'accensione di un gas, vapore o liquido iniettato nel recipiente chiuso.

1.5 CRITERI DI QUALITÀ

La ripetibilità varia secondo l'intervallo delle temperature di autoaccensione e il metodo di prova usato.

La sensibilità e la specificità dipendono dal metodo di prova utilizzato.

1.6 DESCRIZIONE DEL METODO

1.6.1 Apparecchiatura

L'apparecchiatura è descritta nel metodo di cui al punto 1.6.3.

1.6.2 Condizioni di prova

Un campione della sostanza in esame viene saggiato in conformità al metodo di cui al punto 1.6.3.

1.6.3 Esecuzione della prova

Vedi IEC 79-4, DIN 51794, ASTM E 659-78, BS 4056, NF T 20 037.

2 DATI

Registrare la temperatura di prova, la pressione atmosferica, la quantità di campione usato e l'intervallo di tempo dopo il quale si verifica l'accensione.

3 RELAZIONE

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- l'indicazione precisa della sostanza (identificazione e impurezze);
- la quantità di campione usato, la pressione atmosferica,
- l'apparecchiatura usata;
- i risultati delle misure (temperature di prova, risultati relativi all'accensione, e corrispondenti ritardi temporali);
- tutte le osservazioni aggiuntive significative per l'interpretazione dei risultati.

4 BIBLIOGRAFIA

Nessuna.

A.16. TEMPERATURA DI AUTOACCENSIONE RELATIVA DEI SOLIDI**1. METODO****1.1. INTRODUZIONE**

Non devono essere sottoposte a questa prova le sostanze esplosive e le sostanze che si infiammano spontaneamente a contatto con l'aria a temperatura ambiente.

Lo scopo della prova è di fornire informazioni preliminari sull'autoinfiammabilità di sostanze solide a temperature elevate.

Se il calore sviluppato dalla reazione della sostanza con l'ossigeno o dalla sua decomposizione esotermica non viene ceduto con sufficiente rapidità all'ambiente circostante, si ha un autoriscaldamento che porta all'autoaccensione. L'autoaccensione si verifica quindi quando la velocità di produzione di calore supera quella della sua dispersione.

Il procedimento è utile come saggio preliminare per le sostanze solide. Data la complessità dei processi di accensione e di combustione dei solidi, la temperatura di autoaccensione determinata con questo metodo deve essere utilizzata soltanto a scopo di confronto.

1.2. DEFINIZIONI E UNITÀ

La temperatura di autoaccensione ottenuta secondo il presente metodo è la minima temperatura, espressa in °C, alla quale un dato volume di una sostanza si infiamma in determinate condizioni.

1.3. SOSTANZE DI RIFERIMENTO

Nessuna.

1.4. PRINCIPIO DEL METODO

In un forno a temperatura ambiente viene posto un certo volume della sostanza da esaminare; si registra la curva temperatura/tempo relativa alle condizioni esistenti al centro del campione mentre la temperatura del forno viene aumentata fino a 400 °C o fino al punto di fusione, se inferiore, ad una velocità di 0,5 °C/min. Ai fini di questa prova, la temperatura del forno alla quale la temperatura del campione raggiunge i 400 °C per autoriscaldamento è detta temperatura di autoaccensione.

1.5 CRITERI DI QUALITÀ

Nessuno

1.6. DESCRIZIONE DEL METODO**1.6.1 Apparecchiatura****1.6.1.1 Forno**

Forno da laboratorio a temperatura programmata (volume circa 2 litri) con circolazione d'aria naturale e sfogo per esplosioni. Per evitare un rischio potenziale di esplosione, si deve impedire che eventuali gas di decomposizione vengano in contatto con gli elementi riscaldanti elettrici.

1.6.1.2 Cubo di rete metallica

Ritagliare un pezzo di rete d'acciaio inossidabile con luce di 0,045 mm secondo il modello della figura 1. Piegare la rete e fissarla con filo metallico in forma di cubi con la faccia superiore aperta.

1.6.1.3 Termocoppie

Termocoppie adatte

1.6.1.4 Registratore

Qualsiasi registratore a due canali tarato da 0 a 600 °C o tensione corrispondente.

1.6.2 Condizioni di prova

Le sostanze vengono sottoposte a prova nella forma in cui vengono ricevute.

1.6.3 Esecuzione della prova

Il cubo viene riempito con la sostanza da esaminare e battuto leggermente, aggiungendo ulteriore sostanza fino a quando è completamente pieno. Il cubo viene poi sospeso al centro del forno a temperatura ambiente. Una termocoppia viene posta al centro del cubo e l'altra tra il cubo e la parete del forno per registrare la temperatura del forno.

Le temperature del forno e del campione vengono registrate in continuo mentre la temperatura del forno viene aumentata fino a 400 °C o fino al punto di fusione, se inferiore, ad una velocità di 0,5 °C/min.

Quando la sostanza si infiamma, la temperatura del campione presenterà un aumento brusco della temperatura al di sopra di quella del forno.

2 DATI

Rilevante ai fini della valutazione è la temperatura del forno alla quale la temperatura del campione raggiunge i 400 °C per autoriscaldamento (vedi figura 2).

3 RELAZIONE

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- descrizione della sostanza in esame;
- risultati delle misure, inclusa la curva temperatura/tempo,
- tutte le osservazioni aggiuntive significative per l'interpretazione dei risultati.

A.17. PROPRIETÀ OSSIDANTI (SOLIDI)

1 METODO

1.1 INTRODUZIONE

È utile avere informazioni preliminari sulle potenziali proprietà esplosive della sostanza prima di effettuare la prova.

Questa prova non si applica ai liquidi e ai gas, alle sostanze esplosive o altamente infiammabili, e ai perossidi organici.

Non occorre eseguire questa prova quando l'esame delle formule di struttura stabilisce, al di là di ogni ragionevole dubbio, che la sostanza non è suscettibile di reagire esotermicamente con materiale combustibile.

Per appurare se la prova debba essere condotta con precauzioni particolari, è opportuno effettuare un test preliminare.

1.2 DEFINIZIONI ED UNITÀ

Tempo di combustione tempo di reazione, in secondi, riferito allo spostamento della zona di reazione lungo il cumulo, seguendo la procedura descritta nel punto 1.6

Velocità di combustione espressa in mm/s

Velocità di combustione massima il valore più elevato della velocità di combustione ottenuto con miscele contenenti dal 10 % al 90 %, in peso, di ossidante

1.3 SOSTANZA DI RIFERIMENTO

Per la prova e per la prova preliminare si usa il nitrato di bario (grado analitico) come sostanza di riferimento

La miscela di riferimento è costituita da una miscela di nitrato di bario e di polvere di cellulosa, preparata secondo il punto 1.6, che presenta la massima velocità di combustione (di solito una miscela con il 60 % in peso di nitrato di bario)

1.4 PRINCIPIO DEL METODO

Per sicurezza si esegue una prova preliminare. Quando la prova preliminare indica chiaramente che la sostanza in esame presenta proprietà ossidanti, non sono necessarie prove ulteriori. Quando ciò non si verifica, la sostanza deve essere sottoposta alla prova completa

Nella prova completa, la sostanza da esaminare e una sostanza combustibile definita vengono miscelate in vari rapporti. Si formano altrettanti cumuli con le varie miscele e si procede all'accensione di un'estremità di ognuno di essi. La velocità massima determinata viene poi confrontata con la velocità massima di combustione di una miscela di riferimento

1.5 CRITERI DI QUALITÀ

Qualsiasi metodo di macinazione e mescolamento è valido a condizione che la differenza fra le velocità massime di combustione in ciascuna delle 6 prove non differisca dal valore della media aritmetica di oltre il 10 %

1.6. DESCRIZIONE DEL METODO

1.6.1. Preparazione

1.6.1.1. *Sostanza in esame*

Ridurre il campione da esaminare ad una granulometria $< 0,125$ mm usando la seguente procedura: setacciare la sostanza di prova, macinare la frazione rimanente, ripetere la procedura fino a quando tutta la porzione di prova è passata dal setaccio.

Per la macinatura e la setacciatura si può usare qualsiasi apparecchio che soddisfi i criteri di qualità.

Prima di preparare la miscela, la sostanza viene essiccata a 105°C fino a peso costante. Se la temperatura di decomposizione della sostanza da esaminare è inferiore a 105°C , la sostanza deve essere essiccata ad una temperatura opportunamente inferiore.

1.6.1.2. *Sostanza combustibile.*

Come sostanza combustibile si usa la cellulosa in polvere del tipo impiegato per la cromatografia a strato sottile o in colonna. È risultato idoneo un tipo di cellulosa con fibre di lunghezza compresa per l'85 % tra $0,020$ mm e $0,075$ mm. La polvere di cellulosa viene fatta passare attraverso un setaccio a maglia da $0,125$ mm. Per tutta la prova deve essere usata la stessa partita di cellulosa.

Prima di preparare la miscela, la cellulosa in polvere deve essere essiccata a 105°C fino a peso costante.

Se nella prova preliminare si usa farina di legno, preparare farina di legno dolce raccogliendo la porzione che passa attraverso un setaccio da $1,6$ mm, miscelare accuratamente e poi essiccare a 105°C per 4 ore in uno strato di spessore non superiore a 25 mm. Raffreddare e conservare in un contenitore a tenuta d'aria riempito il più possibile fino a quando serve, preferibilmente entro 24 ore dall'essiccazione.

1.6.1.3. *Fonte di ignizione*

Come fonte di ignizione si dovrebbe usare una fiamma calda di un bruciatore a gas (diametro minimo 5 mm). Se si usa un'altra fonte di ignizione (per esempio quando si effettua la prova in atmosfera inerte), devono essere riportate la descrizione e la giustificazione.

1.6.2. Esecuzione della prova

Nota:

Le miscele di ossidanti con cellulosa o farina di legno devono essere trattate come potenzialmente esplosive e maneggiate con la dovuta attenzione.

1.6.2.1. *Prova preliminare*

La sostanza essiccata viene accuratamente miscelata con cellulosa o farina di legno essiccata nel rapporto 2 parti di sostanza in esame/1 parte di cellulosa o farina di legno (in peso) e la miscela viene ammassata in forma di un piccolo cono con un diametro di base di $3,5$ cm \times $2,5$ d'altezza, riempiendo, senza compattazione, un recipiente di forma conica, (per esempio un imbuto da laboratorio con il gambo tappato).

Il mucchietto viene posto su una piastra di base fredda, non combustibile, non porosa e di bassa conducibilità termica. La prova deve essere eseguita sotto cappa di aspirazione dei fumi come indicato al punto 1.6.2.2.

La sorgente di ignizione viene posta in contatto con il cono, e si osservano e registrano il vigore e la durata della reazione risultante.

La sostanza deve essere considerata ossidante se la reazione è vigorosa.

Nei casi in cui il risultato sia dubbio, è necessario completare l'intera sequenza di prova descritta nel seguito.

1 6 2 2 *Prova sequenziale*

Preparare miscele ossidante/cellulosa contenenti dal 10 al 90 % in peso di ossidante in incrementi del 10 %. Per i casi limite, usare miscele ossidante/cellulosa intermedie per ottenere con maggior precisione la massima velocità di combustione.

Il mucchietto viene formato mediante uno stampo di metallo, che presenta una lunghezza di 250 mm e una sezione trasversale triangolare con altezza interna di 10 mm e larghezza interna di 20 mm. Su ambedue i lati dello stampo, nella direzione longitudinale, sono montate due lastre metalliche come limitazioni laterali che sporgono di 2 mm sopra al bordo superiore della sezione triangolare (figura). Questo dispositivo viene riempito con un leggero eccesso di miscela. Dopo aver lasciato cadere una volta lo stampo da un'altezza di 2 cm su una superficie solida, la sostanza in eccesso rimanente viene rimossa con un foglio disposto obliquamente. Le delimitazioni laterali vengono rimosse e la polvere rimanente viene lisciata con l'uso di un rullo. Sopra allo stampo si pone poi una piastra di base non combustibile, non porosa, e di bassa conducibilità termica, l'apparecchio viene invertito e lo stampo rimosso.

Disporre il mucchietto nella corrente d'aria in una cappa.

La velocità dell'aria deve essere sufficiente per impedire ai fumi di propagarsi nel laboratorio e non deve venire variata durante la prova. Intorno all'apparecchio deve essere montato uno schermo per la corrente.

Data l'igroscopicità della cellulosa e di alcune sostanze da esaminare, la prova deve essere eseguita più velocemente possibile.

Accendere un'estremità del cumulo toccandolo con la fiamma.

Misurare il tempo di reazione su una distanza di 200 mm dopo che la zona di reazione si è propagata per una distanza iniziale di 30 mm.

La prova viene eseguita con la sostanza di riferimento e almeno una volta con ciascuna miscela di sostanze di prova e cellulosa della serie.

Se si trova che la velocità massima di combustione è significativamente maggiore di quella della miscela di riferimento, la prova può essere interrotta. Altrimenti la prova deve essere ripetuta 5 volte per ciascuna delle 3 miscele che danno la velocità di combustione più elevata.

Se si sospetta che il risultato sia un falso positivo, ripetere la prova usando una sostanza inerte con granulometria simile, come farina fossile, al posto della cellulosa. In alternativa, la miscela sostanza in esame/cellulosa che presenta la velocità di combustione più elevata deve essere ricontrollata in atmosfera inerte (contenuto d'ossigeno < 2 % v/v).

2

DATI

Per ragioni di sicurezza, deve essere considerato come caratteristica della proprietà ossidante della sostanza in prova il valore massimo della velocità di combustione e non il valore medio.

Ai fini della valutazione si prende in considerazione il più alto valore della velocità di combustione rilevato su una serie di 6 prove su una determinata miscela.

Riportare in grafico il valore più elevato di velocità di combustione per ciascuna miscela contro la concentrazione dell'ossidante. Ricavare dal grafico la velocità massima di combustione.

I sei valori di velocità di combustione misurati in una prova effettuata sulla miscela che presenta la più elevata velocità di combustione non devono differire dalla loro media aritmetica per oltre il 10 %, altrimenti deve essere migliorato il metodo di macinatura e miscelazione.

Confrontare la velocità di combustione massima ottenuta con la massima velocità di combustione della miscela di riferimento (vedi 1.3).

Se le prove vengono condotte in atmosfera inerte, la velocità di reazione massima viene confrontata con quella della miscela di riferimento in atmosfera inerte.

3. RELAZIONE

3.1. RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- l'identità, composizione, purezza, umidità ecc. della sostanza esaminata;
- eventuali trattamenti del campione in esame (per esempio macinatura, essiccazione, ecc.);
- la fonte di ignizione usata nelle prove;
- i risultati delle misure;
- la modalità di reazione (per esempio fiammata superficiale, combustione attraverso l'intera massa, eventuali informazioni relative ai prodotti di combustione, ecc.);
- ogni osservazione aggiuntiva significativa per l'interpretazione dei risultati, inclusa una descrizione del vigore (la miscela arde, produce scintille, esala fumi, brucia senza fiamma, ecc.) e la durata approssimata prodotta nella prova preliminare di sicurezza/vagliatura per la sostanza in esame e la sostanza di riferimento;
- i risultati delle prove eventuali con sostanze inerti;
- i risultati delle prove eventuali in atmosfera inerte.

3.2. INTERPRETAZIONE DEI RISULTATI

Una sostanza è considerata come ossidante quando:

- (a) nella prova preliminare c'è una reazione vigorosa,
- (b) nella prova, la velocità massima di combustione delle miscele analizzate è maggiore o uguale alla velocità di combustione della miscela di cellulosa e di nitrato di bario.

Al fine di evitare un falso positivo, i risultati ottenuti nella prova della sostanza miscelata con un materiale inerte e/o sotto atmosfera inerte devono essere tenuti in considerazione nell'interpretazione dei risultati.

- B.38 Neurotossicità ritardata di sostanze organofosforiche con somministrazione ripetuta per 28 giorni

B. DEFINIZIONI GENERALI DEI TERMINI UTILIZZATI NEI METODI DI SAGGIO ILLUSTRATI NEL PRESENTE ALLEGATO

- i) La **tossicità acuta** comprende gli effetti avversi che si verificano entro un dato tempo* (in genere 14 giorni) dalla somministrazione di una singola dose di sostanza.
- ii) La **tossicità evidente** è un termine generale che descrive chiari segni di tossicità risultanti dalla somministrazione della sostanza in esame. Tali segni devono essere sufficienti per consentire una valutazione dei rischi e tali che un aumento della dose somministrata sia suscettibile di produrre effetti tossici gravi ed eventualmente letali.
- iii) La **dose** e la quantità di sostanza somministrata. Essa viene espressa in termini di peso (grammi o milligrammi) o peso di sostanza saggiata per unità di peso dell'animale usato per il saggio (p. es., milligrammi per chilogrammo di peso corporeo), o ancora concentrazione alimentare costante (parti per milione o milligrammi per chilogrammo di alimento).
- iv) La **dose discriminante** è il maggiore dei quattro livelli di dosaggio fisso che possono essere somministrati senza cagionare mortalità in relazione con la sostanza saggiata (compresa la mortalità per eutanasia).

- v) La **posologia** è un termine generico che designa la dose, la frequenza e la durata della somministrazione
- vi) La **DL₅₀** (dose letale media) è la dose singola di una sostanza, valutata statisticamente, che si prevede causi la morte del 50 % degli animali trattati. Il valore della DL₅₀ viene espresso in termini di peso della sostanza saggiata per unità di peso dell'animale usato per il saggio (milligrammi per chilogrammo).
- vii) La **CL₅₀** (concentrazione letale media) è la concentrazione di una sostanza, valutata statisticamente, che si può prevedere causi la morte durante l'esposizione o entro un determinato tempo, consecutivo all'esposizione, del 50 % degli animali esposti per un determinato periodo. Il valore della CL₅₀ viene espresso in termini di peso della sostanza in esame per volume standard di aria (milligrammi per litro)
- viii) **NOAEL** è l'abbreviazione dell'inglese "no observed adverse effect level" e designa la dose o il livello di esposizione massimo per i quali non siano stati osservati effetti avversi
- ix) La **tossicità subcronica da somministrazione ripetuta** comprende gli effetti avversi cagionati negli animali dalla somministrazione ripetuta quotidianamente di una dose o da una esposizione ripetuta quotidianamente a una sostanza chimica per una breve parte della loro prevista durata di vita
- x) La **dose massima tollerata (DMT)** è il livello massimo di dose che provoca sintomi di tossicità in animali senza avere effetti rilevanti sulla sopravvivenza, in relazione al saggio in cui viene usata
- xi) L'**irritazione cutanea** è la produzione di alterazioni infiammatorie reversibili nella cute a seguito dell'applicazione della sostanza in esame
- xii) L'**irritazione oculare** è la produzione di alterazioni reversibili nell'occhio a seguito dell'applicazione della sostanza in esame sulla superficie anteriore dell'occhio
- xiii) La **sensibilizzazione cutanea** (dermatite allergica da contatto) è una reazione cutanea ad una sostanza mediata da fattori immunologici
- xiv) La **corrosione del derma** è la produzione di lesioni irreversibili dei tessuti cutanei a seguito dell'applicazione della sostanza in esame per un periodo compreso tra 3 minuti e 4 ore
- xv) La **tossicocinetica** è lo studio dell'assorbimento, della distribuzione, del metabolismo o dell'escrezione delle sostanze in esame
- xvi) L'**assorbimento** corrisponde al/ai processo/i per cui una sostanza somministrata penetra nell'organismo
- xvii) L'**escrezione** corrisponde al/ai processo/i per cui una sostanza somministrata e/o i suoi metaboliti vengono eliminati dall'organismo
- xviii) La **distribuzione** corrisponde al/ai processo/i per cui la sostanza assorbita e/o i suoi metaboliti si distribuiscono nell'organismo
- xix) Il **metabolismo** corrisponde al/ai processo/i per cui le sostanze somministrate subiscono nell'organismo reazioni enzimatiche o non enzimatiche che ne modificano la struttura

B1 Tossicità acuta — tossicità a dose ripetuta / tossicità cronica e subcronica

Diversi saggi (metodi da B1 a B5) consentono di valutare gli effetti tossici acuti e la tossicità specifica o sistemica di una sostanza, essi forniscono un'indicazione preliminare sulla tossicità con la somministrazione di una singola dose

In funzione della tossicità di una sostanza, può essere opportuno effettuare un saggio limite come approccio al saggio di DL₅₀, negli studi per inalazione non è specificato alcun saggio limite, in quanto non è stato possibile definire un valore limite di esposizione singola per inalazione

La preferenza dovrà essere accordata ai metodi che facciano il minore ricorso possibile agli animali e riducano al massimo le sofferenze ad essi cagionate, quali, per esempio, il metodo a dose fissa (metodo B1 bis) e il metodo della classe di tossicità acuta (metodo B1 tris). Per i saggi di livello 1, le conclusioni del primo studio possono essere integrate da uno studio su una seconda specie. In questo caso potrà essere utilizzato un metodo di saggi standard o il metodo potrà essere adattato per un numero minore di animali

Il saggio di tossicità a dose ripetuta (metodi B.7, B.8 e B.9) consente di valutare gli effetti tossici derivanti da un'esposizione ripetuta. È necessaria un'accurata osservazione clinica degli animali per ottenere il maggior numero possibile di informazioni. Tali saggi sono finalizzati all'individuazione degli organi bersaglio della tossicità e alla determinazione delle dosi tossiche e non tossiche. Negli studi a lungo termine si potrà rendere necessaria un'analisi più approfondita di questi aspetti (metodi B.26 - B.30 e B.33).

B.II Mutagenicità — genotossicità

La mutagenicità designa l'induzione di modificazioni permanenti e trasmissibili nella quantità o nella struttura del materiale genetico delle cellule o degli organismi. Tali modificazioni o "mutazioni" possono interessare un singolo gene o segmenti di un gene, un blocco di geni o interi cromosomi. Gli effetti su interi cromosomi possono essere strutturali e/o numerici.

L'attività mutagena di una sostanza viene valutata attraverso saggi *in vitro* su batteri per le mutazioni genetiche (puntiformi) (metodi B.13/14) e/o su cellule di mammifero per le aberrazioni strutturali cromosomiche (metodo B.10).

Sono accettabili anche procedure *in vivo*, quali il saggio del micronucleo (metodo B.12) o il saggio dell'analisi metafisica delle cellule di midollo osseo (metodo B.11). In assenza di controindicazioni sono tuttavia decisamente da preferire i metodi *in vitro*.

Per maggiori volumi di produzione e/o per l'esecuzione o la messa a punto di una valutazione dei rischi possono essere necessari studi complementari intesi a determinare con precisione il potenziale mutageno di una sostanza o a individuarne l'eventuale cancerogenicità. Tali studi possono essere utilizzati per diversi scopi: confermare i risultati ottenuti nei saggi di base, esaminare parametri non contemplati nei saggi di base, avviare o ampliare saggi *in vivo*.

A questo scopo, i metodi da B.15 a B.25 utilizzano sistemi eucarioti sia *in vivo* che *in vitro* e comprendono un'ampia gamma di parametri biologici. Tali saggi forniscono informazioni sulle mutazioni puntiformi e su altri parametri in organismi più complessi rispetto ai batteri utilizzati nei saggi di base.

In linea generale, qualora si decida la realizzazione di un programma complementare di studi di mutagenicità, questo dovrà essere formulato in modo da apportare informazioni complementari pertinenti sul potenziale mutageno e/o cancerogeno della sostanza in esame.

La scelta del saggio più appropriato al caso in esame dipende da tutta una serie di fattori, tra cui le caratteristiche fisico-chimiche della sostanza, i risultati dei primi saggi batterici e citogenetici, il profilo metabolico della sostanza, i risultati di altri studi di tossicità e gli usi noti della sostanza. Data la molteplicità dei fattori da prendere in esame, è sconsigliabile applicare criteri troppo rigidi nella scelta dei saggi da eseguire.

Alcuni principi generali sui metodi di saggio da adottare vengono fissati dalla direttiva 93/67/CEE; il documento tecnico di orientamento sulla valutazione dei rischi definisce invece precise strategie a questo riguardo, pur ammettendo una certa flessibilità e adattabilità in funzione delle circostanze specifiche.

Qui di seguito vengono elencati i metodi di saggio complementari, raggruppati in funzione del loro principale parametro genetico:

Studi sulle mutazioni geniche (puntiformi)

- a) Studi sulla mutazione *in avanti* o sulla mutazione *inversa* usando microrganismi eucarioti (*Saccharomyces cerevisiae*) (metodo B.15)
- b) Studi *in vitro* sulla mutazione *in avanti* di cellule di mammifero (metodo B.17)
- c) Saggio dei letali recessivi legati al sesso su *Drosophila melanogaster* (metodo B.20)
- d) Saggio di mutazione somatica cellulare *in vivo*, saggio delle macchie nel topo (metodo B.24)

Studi sulle aberrazioni cromosomiche

- a) Studi citogenetici *in vivo* nei mammiferi; può essere opportuno procedere ad un'analisi metafisica *in vivo* delle cellule di midollo osseo, qualora essa non sia stata effettuata nel corso della valutazione iniziale (metodo B.11). È inoltre possibile studiare la citogenetica delle cellule germinali *in vivo* (metodo B.23)
- b) Studi citogenetici *in vitro* su cellule di mammifero, se non effettuati nel corso della valutazione iniziale (metodo B.10)
- c) Studi dei letali dominanti nei roditori (metodo B.22)
- d) Saggio di traslocazione ereditabile nel topo (metodo B.25)

Effetti genotossici — effetti sul DNA

La genotossicità, che designa effetti potenzialmente nocivi sul materiale genetico non necessariamente associati a mutagenicità, può essere identificata sulla base di danni indotti sul DNA senza evidenza diretta di mutazione. Per questo tipo di indagine possono essere appropriati i metodi elencati qui di seguito, che utilizzano microrganismi eucarioti o cellule di mammifero:

- a) Ricombinazione mitotica su *Saccharomyces cerevisiae* (metodo B.16)
- b) Danno e riparazione del DNA — sintesi non programmata del DNA — cellule di mammifero — in vitro (metodo B.18)
- c) Scambio di cromatidi fratelli in cellule di mammifero — in vitro (metodo B.19)

Metodi alternativi per lo studio del potenziale cancerogeno

Esistono saggi di trasformazione su cellule di mammifero che consentono di determinare la capacità di una sostanza di indurre, in colture cellulari, modificazioni morfologiche e comportamentali che si ritiene possano essere associate ad una trasformazione maligna in vivo (metodo B.21). Possono essere utilizzati un certo numero di tipi cellulari e di criteri di trasformazione.

Valutazione del rischio di effetti ereditabili nei mammiferi

Esistono metodi atti a determinare gli effetti ereditabili indotti nei mammiferi da mutazioni genetiche (puntiformi), come il saggio dei loci specifici nel topo, che consente di misurare la mutazione della cellula germinale nella prima generazione (non illustrato nel presente allegato), o a determinare aberrazioni cromosomiche, come la prova di traslocazione ereditabile nel topo (metodo B.25). Tali metodi possono essere utilizzati per la valutazione del possibile rischio genetico di una sostanza per l'uomo. Tuttavia, data la loro complessità e l'elevato numero di animali richiesti, soprattutto per il saggio dei loci specifici, studi di questo tipo dovranno essere effettuati solo se strettamente necessari.

B III Cancerogenicità

Le sostanze chimiche possono essere classificate come agenti cancerogeni genotossici o non genotossici in funzione del meccanismo d'azione presunto.

Gli studi di mutagenicità/genotossicità consentono di effettuare uno screening preliminare per la determinazione del potenziale cancerogeno genotossico di una sostanza. Ulteriori informazioni possono essere fornite dai saggi di tossicità a dose ripetuta, di tossicità subcronica o cronica. Il saggio di tossicità a dose ripetuta (metodo B.7) e gli studi a lungo termine a dose ripetuta comportano una valutazione delle modificazioni istopatologiche osservate, quale per esempio l'iperplasia di determinati tessuti. Tali studi, insieme alle informazioni tossicocinetiche, possono contribuire all'identificazione di sostanze chimiche dotate di un potenziale cancerogeno, su cui potranno essere effettuate indagini più approfondite tramite un saggio di cancerogenicità (Metodo B.32) o, in molti casi, uno studio combinato di tossicità cronica e cancerogenicità (Metodo B.33).

B IV Tossicità per la riproduzione

La tossicità per la riproduzione può esprimersi in diversi modi, per esempio attraverso un'alterazione della funzione o della capacità riproduttiva maschile o femminile, definita come "effetti sulla fertilità", o la comparsa nella prole di effetti avversi non ereditabili, definita come "tossicità per lo sviluppo", concetto in cui rientrano anche la teratogenicità e gli effetti durante l'allattamento.

Per gli studi di teratogenicità, che fanno parte dello screening di tossicità per lo sviluppo, il metodo di saggio (metodo B.31) è sostanzialmente finalizzato alla somministrazione per via orale. In funzione delle caratteristiche fisiche della sostanza in esame o della via probabile di esposizione per l'uomo, è possibile il ricorso alternativo ad altre vie di somministrazione. In tal caso occorre modificare opportunamente il metodo di saggio tenendo conto degli elementi pertinenti dei metodi di saggio su 28 giorni.

Qualora sia necessario uno studio della riproduzione su tre generazioni (fertilità), è possibile utilizzare il metodo descritto per il saggio di riproduzione su due generazioni (metodo B.35) estendendolo ad una terza.

B V Neurotossicità

La neurotossicità può esprimersi in modi diversi, per esempio attraverso modificazioni funzionali e/o strutturali e modificazioni biochimiche nel sistema nervoso centrale o periferico. I saggi di tossicità acuta consentono di ottenere una prima indicazione sulla neurotossicità di una sostanza. Il saggio di tossicità a dose ripetuta (metodo B.7) comprende una valutazione degli effetti neurotossici, l'osservazione clinica degli animali deve essere particolarmente accurata per poter ottenere il maggior numero possibile di informazioni. Scopo di questo metodo è consentire l'individuazione di sostanze chimiche dotate di un potenziale neurotossico, che possono necessitare di indagini più approfondite al riguardo. Inoltre, è importante valutare la facoltà di una sostanza di indurre effetti neurotossici specifici che potrebbero non essere evidenziati da altri studi di tossicità. Per esempio, è stato osservato che alcune sostanze organofosforiche producono effetti neurotossici ritardati che possono essere valutati con i metodi B.37 e B.38, previa esposizione a dose singola o a dose ripetuta.

B.VI Immunotossicità

L'immunotossicità può esprimersi in diversi modi, per esempio l'immunosoppressione e/o il rafforzamento della risposta immunitaria, che dà luogo ad ipersensibilità o ad autoimmunità indotta. Il saggio di tossicità a dose ripetuta (metodo B.7) prevede una valutazione degli effetti immunotossici. Tale metodo è inteso a consentire l'identificazione di sostanze chimiche dotate di un potenziale immunotossico, che possono necessitare di indagini più approfondite al riguardo.

B.VII Tossicocinetica

Gli studi di tossicocinetica sono finalizzati all'interpretazione e alla valutazione dei dati di tossicità. Essi hanno lo scopo di chiarire determinati aspetti particolari della tossicità della sostanza chimica in esame e i risultati ottenuti possono essere di aiuto nella progettazione di ulteriori studi. Non si considera che sia necessario determinare la totalità dei parametri in ciascun caso. La sequenza completa degli studi tossicocinetici (assorbimento, escrezione, distribuzione e metabolismo) sarà necessaria solo in rari casi. Per taluni composti potrebbero essere opportune modifiche di detta sequenza, ovvero potrebbe essere sufficiente uno studio con dose unica (metodo B.36).

Le informazioni sulla struttura chimica (SAR, cioè structure activity relationship) e sulle proprietà fisico-chimiche possono anche fornire indicazioni sulle caratteristiche di assorbimento attraverso la via di somministrazione prevista e le possibilità metaboliche e di distribuzione nel tessuto. Informazioni sui parametri tossicocinetici possono inoltre provenire da precedenti studi di tossicità e di tossicocinetica.

C. CARATTERIZZAZIONE DELLA SOSTANZA IN ESAME

Prima dell'inizio di qualsiasi studio di tossicità occorre conoscere la composizione della sostanza in esame, incluse le impurità principali e le proprietà fisico-chimiche pertinenti, compresa la stabilità.

Le proprietà fisico-chimiche della sostanza in esame forniscono informazioni importanti per la scelta della via di somministrazione, per la progettazione dei vari studi e per il trattamento e la conservazione della sostanza in esame.

L'elaborazione di un metodo analitico per la determinazione qualitativa e quantitativa della sostanza in esame (comprese, se possibile, le principali impurità) nel mezzo di dosaggio e nel materiale biologico deve precedere l'inizio dello studio.

Tutte le informazioni relative all'identificazione, alle proprietà fisico-chimiche, alla purezza e al comportamento della sostanza devono essere riportate nella relazione del saggio.

D. CURA DEGLI ANIMALI

Nei saggi di tossicità è indispensabile esercitare un rigoroso controllo delle condizioni ambientali e utilizzare tecniche adeguate per la cura degli animali.

(i) Condizioni di alloggiamento

Le condizioni ambientali nei locali o nei recinti degli animali da laboratorio devono essere appropriate per le specie sperimentali. Per ratti, topi e porcellini d'India è indicata una temperatura ambiente di $22^{\circ}\text{C} \pm 3^{\circ}\text{C}$ con un'umidità relativa del 30-70 %. Per i conigli, la temperatura deve essere di $20 \pm 3^{\circ}\text{C}$ con un'umidità relativa del 30-70 %.

Talune tecniche sperimentali sono particolarmente sensibili agli effetti della temperatura e, in tali casi, la descrizione del metodo di saggio comprende indicazioni precise sulle condizioni adeguate. In tutti gli studi di tossicità, la temperatura e l'umidità devono essere controllate, registrate e riportate nella relazione finale dello studio.

L'illuminazione deve essere artificiale ed alternare 12 ore di luce e 12 ore di oscurità. Le condizioni di illuminazione devono essere dettagliatamente registrate e riportate nella relazione finale dello studio.

Salvo nel caso in cui venga diversamente specificato nel metodo, gli animali dovranno essere alloggiati in gabbie individuali o contenenti piccoli gruppi dello stesso sesso. In questo caso il numero degli animali non dovrà essere superiore a cinque.

Nelle relazioni sugli esperimenti effettuati su animali dovranno essere indicati il tipo di gabbie utilizzate e il numero di animali alloggiati in ogni gabbia sia durante l'esposizione alla sostanza chimica che durante tutto il periodo successivo di osservazione.

(ii) Condizioni di alimentazione

La dieta deve soddisfare tutte le esigenze nutrizionali della specie utilizzata per il saggio. Qualora le sostanze in esame vengano somministrate agli animali nella loro dieta, il valore nutrizionale degli alimenti potrebbe essere ridotto per effetto dell'interazione tra la sostanza ed un costituente dietetico. Nell'interpretazione dei risultati dei saggi si dovrà tener conto di questa possibilità. Gli animali potranno essere nutriti con diete convenzionali da laboratorio ed abbeverati con acqua a sazietà. La scelta della dieta potrà essere condizionata dalla necessità di garantire un apporto adeguato della sostanza in esame, qualora essa venga somministrata con gli alimenti.

I contaminanti dietetici suscettibili di influenzare la tossicità non dovrebbero essere presenti in condizioni tali da causare interferenze.

E BENESSERE DEGLI ANIMALI

Nell'elaborazione dei metodi sperimentali si è tenuto in debita considerazione il benessere degli animali. Citiamo brevemente qui di seguito alcuni esempi, benché l'elenco sia lungi dall'essere completo. Per le espressioni e/o le condizioni esatte, si farà riferimento al testo dei metodi:

- Per la determinazione della tossicità orale acuta esistono due metodi alternativi: il "metodo a dose fissa" e il "metodo della classe di tossicità acuta". Il "metodo a dose fissa" non utilizza la morte come parametro specifico di valutazione e richiede un minor numero di animali. Il "metodo della classe di tossicità acuta" utilizza in media il 70 % di animali in meno rispetto al metodo B.1 per la tossicità acuta orale. Entrambi questi metodi alternativi comportano minor sofferenza e dolore fisico rispetto alla metodologia classica.
- Il numero degli animali utilizzati è ridotto al minimo scientificamente accettabile: solo 5 animali di egual sesso vengono trattati per ogni livello di dosaggio per i metodi B.1 e B.3; solo 10 animali (e solo 5 per il gruppo di controllo negativo) vengono utilizzati per determinare la sensibilizzazione cutanea con il saggio di massimizzazione nel porcellino d'India (Guinea-Pig Maximisation Test, metodo B.6), anche il numero di animali necessari per il controllo positivo negli studi di mutagenicità in vivo è ridotto (metodi B.11 e B.12).
- Le sofferenze inflitte agli animali durante i saggi sono ridotte al minimo: gli animali che presentano segni di sofferenza gravi e persistenti dovranno essere sottoposti ad eutanasia, le sostanze in esame non dovranno essere somministrate in dosaggi suscettibili di cagionare sofferenze gravi per effetto delle loro proprietà corrosive o irritanti (metodi B.1, B.2 e B.3).
- L'introduzione di saggi limite consente di evitare la somministrazione di dosi inutilmente elevate, non solo nei saggi di tossicità acuta (metodi B.1, B.2 e B.3), ma anche nei saggi di mutagenicità in vivo (metodi B.11 e B.12).
- Una strategia per la determinazione del grado di irritabilità consente di non effettuare un saggio o di limitarlo ad un solo animale laddove si disponga di sufficienti elementi scientifici giustificativi.

Tale evidenza scientifica può essere data dalle proprietà fisico-chimiche della sostanza, dai risultati di saggi precedenti o dai risultati di saggi in vitro debitamente confermati. Per esempio, qualora in uno studio di tossicità cutanea acuta con somministrazione di una dose limite (metodo B.3) non siano stati osservati segni di irritazione del derma, può non essere necessario effettuare ulteriori prove di irritazione cutanea (metodo B.4), le sostanze rivelatesi effettivamente corrosive o fortemente irritanti per la pelle nell'ambito di uno studio di irritazione cutanea (metodo B.4) non dovranno essere ulteriormente saggiate per l'irritazione oculare (metodo B.5).

F METODI ALTERNATIVI

Uno degli obiettivi scientifici dell'Unione europea è di sviluppare e collaudare tecniche alternative che consentano di ottenere lo stesso livello di informazioni degli attuali esperimenti su animali, riducendo tuttavia il numero di animali utilizzati e le sofferenze ad essi inflitte o evitando del tutto il ricorso agli animali.

Non appena perfezionati, tali metodi dovranno costituire, ove possibile, la scelta d'elezione per gli studi miranti alla caratterizzazione dei rischi e alla conseguente classificazione ed etichettatura delle sostanze in funzione dei rischi intrinseci.

G VALUTAZIONE E INTERPRETAZIONE

Nella valutazione ed interpretazione dei saggi occorre tener conto dei limiti entro i quali i risultati di studi su animali e in vitro possono essere estrapolati direttamente all'uomo, laddove si abbia evidenza di effetti avversi per l'uomo, questa potrà essere utilizzata per confermare i risultati sperimentali.

Tali risultati possono servire per la classificazione e l'etichettatura di sostanze nuove o già esistenti per quanto riguarda gli effetti sulla salute dell'uomo, sulla base delle loro proprietà intrinseche, identificate e quantificate da tali metodi. I criteri per la classificazione e l'etichettatura di cui all'allegato VI fanno riferimento anche ai parametri previsti dai protocolli sperimentali riportati nei presenti metodi di saggio.

Tali risultati possono inoltre essere utilizzati per studi di valutazione dei rischi di sostanze chimiche nuove o già esistenti, adeguate strategie sperimentali sono indicate a tale scopo nei corrispondenti documenti orientativi.

H RIFERIMENTI BIBLIOGRAFICI

La maggior parte di detti metodi è stata messa a punto nell'ambito del programma per la definizione di linee guida elaborato dall'OCSE in materia di saggi. Essi dovranno essere applicati in conformità con i principi delle buone pratiche di laboratorio allo scopo di garantire il più possibile il "reciproco riconoscimento dei dati".

Ulteriori informazioni sono reperibili nei riferimenti citati nelle linee guida dell'OCSE e nell'ampia letteratura esistente in materia.

B.1. TOSSICITÀ ACUTA PER VIA ORALE

1. METODO

1.1. INTRODUZIONE

Vedi introduzione generale, parte B

1.2. DEFINIZIONI

Vedi introduzione generale, parte B

1.3. SOSTANZE DI RIFERIMENTO

Nessuna.

1.4. PRINCIPIO DEL METODO DI SAGGIO

La sostanza da saggiare viene somministrata per via orale mediante gavaggio in dosi graduate (un livello di dose per gruppo) a vari gruppi di animali. Vengono quindi osservati gli effetti e gli eventi letali. Gli animali morti durante il saggio vengono sottoposti a necropsia e, a conclusione del saggio, si procede alla necropsia di quelli rimasti in vita. Questo metodo riguarda principalmente gli studi sui roditori.

Può essere necessaria la eutanasia degli animali che mostrino indizi gravi e permanenti di sofferenza e dolore. Non è necessario eseguire la somministrazione di sostanze di prova in una maniera che notoriamente provoca evidente dolore e sofferenza in conseguenza di proprietà corrosive o irritanti.

1.5. CRITERI DI QUALITÀ

Nessuno.

1.6. DESCRIZIONE DEL METODO DI SAGGIO

1.6.1. Preparazioni

Prima del saggio gli animali sono mantenuti nelle stesse condizioni di stabulazione e di alimentazione dell'esperimento per un periodo di almeno 5 giorni. Prima dell'esecuzione del saggio gli animali che dovranno essere giovani adulti e sani sono scelti con metodo casuale e assegnati ai gruppi sperimentali. Se necessario, la sostanza in esame viene sciolta o sospesa in veicolo adatto. Si raccomanda di considerare, ovunque possibile, come prima scelta una soluzione acquosa, seguita da una soluzione in olio vegetale e quindi in altri veicoli o una sospensione. Per i veicoli non acquosi, le caratteristiche di tossicità del veicolo dovranno essere note o, in caso contrario, dovranno essere determinate prima o durante il saggio. Nei roditori, generalmente il volume non dovrebbe superare 10 ml/kg di peso corporeo, a meno che non vengano utilizzate soluzioni acquose, nel qual caso si possono raggiungere 20 ml/kg. La variabilità del volume di saggio dovrà essere ridotta al minimo, regolando la concentrazione per assicurare la somministrazione di un volume costante a tutti i dosaggi.

1.6.2. Condizioni per il saggio

1.6.2.1. *Animali da esperimento*

Salvo controindicazioni, il ratto è la specie d'elezione.

Si dovrebbero utilizzare ceppi di laboratorio comunemente usati. Per ciascun sesso, all'inizio del saggio, l'intervallo della variazione ponderale degli animali utilizzati non dovrà superare più o meno il 20% del valore medio.

1 6 2 2 *Numero e sesso*

Per ciascun saggio vengono usati almeno 5 roditori a ciascun livello di dosaggio. Essi dovranno essere tutti dello stesso sesso. Se si usano femmine, dovranno essere nullipare e non gravide. Nel caso siano disponibili informazioni che dimostrano che un sesso è nettamente più sensibile, si dovranno usare animali di questo sesso.

Nota: nei saggi di tossicità acuta con animali di ordine superiore ai roditori, si dovrebbe prendere in considerazione l'uso di un numero minore di animali.

Le dosi devono essere accuratamente scelte e si deve fare ogni sforzo possibile per non superare dosi moderatamente tossiche. In tali prove si dovrebbe evitare la somministrazione di dosi letali della sostanza in esame.

1 6 2 3 *Livelli di dosaggio*

Questi dovranno essere in numero sufficiente, almeno tre, opportunamente intervallati per produrre nei gruppi trattati una graduazione di effetti tossici e di mortalità. I risultati dovrebbero essere sufficienti per fornire una curva dose-risposta e, quando possibile, permettere un'accettabile determinazione della DL_{50} .

1 6 2 4 *Saggio limite*

Quando si usano dei roditori, si può eseguire un saggio limite ad un unico livello di dosaggio di almeno 2 000 mg/kg in un gruppo di 5 maschi e 5 femmine utilizzando le procedure sopra descritte. Se si osserva mortalità correlata all'esposizione al composto, può essere necessario prendere in considerazione uno studio completo.

1 6 2 5 *Periodo di osservazione*

Il periodo di osservazione dovrebbe essere di almeno 14 giorni. Tuttavia, tale durata non è tassativa. Essa dovrebbe dipendere dalla natura delle reazioni tossiche, dalla velocità del loro insorgere e dalla durata del periodo di recupero; essa può quindi essere estesa, se considerato necessario. Il momento in cui compaiono e scompaiono i segni di tossicità e il momento in cui sopraggiunge la morte sono importanti, soprattutto la sostanza in esame tende a causare mortalità ritardata.

1 6 3 *Procedimento*

Prima della somministrazione della sostanza in esame, gli animali vanno tenuti a digiuno. Al ratto non dovrebbe essere somministrato cibo durante la notte prima dell'esperimento, per animali con metabolismo più veloce, un periodo di digiuno più breve è adeguato, l'acqua resterà disponibile ad libitum. Il giorno successivo, gli animali devono essere pesati e poi la sostanza in esame somministrata mediante ingozzatura in una dose singola.

Qualora non sia possibile somministrare tutta la quantità con una singola dose, si può procedere alla somministrazione ripetuta di frazioni più piccole della stessa durante un periodo non superiore alle 24 ore. A somministrazione della sostanza avvenuta, il cibo può essere sospeso per altre 3 o 4 ore. Nel caso di una dose somministrata in frazioni durante un certo periodo di tempo, può essere necessario fornire agli animali cibo e acqua in misura dipendente dalla durata del periodo di somministrazione.

Dopo la somministrazione, si effettuano osservazioni e si registrano sistematicamente i risultati per ogni singolo animale. Durante il primo giorno, le osservazioni dovrebbero essere frequenti.

Un attento esame clinico dovrebbe essere effettuato almeno una volta al giorno per 5 giorni per settimana. Altre osservazioni dovrebbero essere effettuate quotidianamente, accompagnate da azioni adeguate per minimizzare la perdita di animali dall'esperimento, ad esempio, necropsia oppure refrigerazione degli animali deceduti e isolamento o sacrificio degli animali deboli o moribondi. Le osservazioni devono includere le alterazioni della cute e del pelo, degli occhi e delle membrane mucose, e anche del sistema respiratorio, circolatorio, nervoso autonomo e centrale, dell'attività somatomotoria e del quadro comportamentale. Particolare attenzione dovrebbe essere rivolta all'osservazione di tremori, convulsioni, salivazione, diarrea, letargia, sonno e coma. Il momento in cui sopraggiunge il decesso dell'animale dovrà essere registrato con la massima precisione possibile.

Gli animali che muoiono durante il saggio e quelli che sopravvivono alla fine dello stesso sono sottoposti a necropsia. Tutti i cambiamenti patologici macroscopici devono essere registrati. Ove opportuno, si dovrebbero prelevare tessuti per l'esame istopatologico.

Valutazione della tossicità nell'altro sesso

Dopo il completamento dello studio su un sesso, si tratta almeno un gruppo rimanente di 5 animali dell'altro sesso con un livello di dose per verificare che gli animali di tale sesso non siano nettamente più sensibili alla sostanza in esame. In circostanze particolari può essere giustificato l'uso di un minor numero di animali. Nel caso in cui siano disponibili informazioni adeguate che dimostrano che gli animali del sesso controllato sono nettamente più sensibili, si può fare a meno di effettuare la prova su animali dell'altro sesso.

2. DATI

I dati dovranno essere riassunti in una tabella indicante, per ogni gruppo di saggio, il numero di animali all'inizio del saggio, il momento del decesso di ciascun animale, il numero di animali che presentano altri segni di tossicità, la descrizione degli effetti tossici e i risultati della necropsia. Il peso di ciascun animale dovrà essere determinato e registrato poco prima della somministrazione della sostanza, quindi ogni settimana e al momento del decesso. Le variazioni di peso dovranno essere calcolate e registrate quando la sopravvivenza dell'animale supera un giorno. Gli animali che vengono uccisi per ragioni umanitarie in conseguenza di sofferenza e dolore dovuti al composto vengono registrati come morti in conseguenza del composto. La DL_{50} può essere determinata con un metodo riconosciuto.

La valutazione dei dati dovrà includere il rapporto, se esistente, tra l'esposizione degli animali alla sostanza in esame e l'incidenza e gravità di tutte le alterazioni, incluse quelle comportamentali e cliniche, le lesioni macroscopiche, le variazioni del peso corporeo, la mortalità e qualsiasi altro effetto tossico.

3. RELAZIONE**3.1. RELAZIONE SUL SAGGIO**

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- specie, ceppo, origine degli animali usati, condizioni ambientali, dieta, ecc.;
- condizioni dell'esperimento;
- livelli di dosaggio (con veicolo, se usato, e concentrazione);
- sesso degli animali sottoposti a somministrazione;
- tabulato dei dati di risposta per sesso e livello di dosaggio (cioè numero degli animali morti o sacrificati durante la prova, numero degli animali che mostrano sintomi di tossicità, numero degli animali esposti);
- tempo intercorso tra la somministrazione della sostanza e la morte, ragioni e criteri usati per la eutanasia degli animali;
- tutte le osservazioni;
- valore della DL_{50} per il sesso sottoposto ad uno studio completo determinato a 14 giorni (specificando il metodo di determinazione);
- intervallo di confidenza statistica del 95 % per la DL_{50} (dove possa essere fornito);
- curva dose-mortalità e relativo coefficiente angolare (se il metodo di determinazione lo consente);
- risultati dell'esame necroscopico;
- qualsiasi reperto istopatologico;
- risultati delle eventuali prove effettuate sull'altro sesso;
- discussione dei risultati (particolare attenzione va posta all'effetto che la soppressione umanitaria di animali durante la prova può avere sul valore calcolato della DL_{50});
- interpretazione dei risultati.

1.2 DEFINIZIONI

Vedi introduzione generale, parte B

1.3. SOSTANZE DI RIFERIMENTO

Nessuna

1.4 PRINCIPIO DEL METODO DI PROVA

Il test di tossicità acuta per via orale fornisce dati sugli effetti nocivi che possono manifestarsi entro un breve periodo di tempo dall'ingestione di un'unica dose della sostanza di prova

Il metodo a dose fissa prevede due fasi

In uno studio preliminare di osservazione si analizzano sequenzialmente gli effetti di varie dosi somministrate oralmente mediante sonda a singole cavie dello stesso sesso. Lo studio di osservazione fornisce informazioni sul rapporto intercorrente fra dose somministrata e tossicità, compresa una valutazione della dose minima letale. Normalmente non si impiegano più di 5 cavie in questa prima fase.

Nello studio principale la sostanza è somministrata oralmente mediante sonda a gruppi di 5 animali maschi e 5 animali femmine ad uno dei livelli prestabiliti (5, 50, 500 o 2 000 mg/kg). La dose impiegata è quella derivata dallo studio di osservazione in grado di produrre «tossicità evidente» (vedi 1.2. Definizioni), ma non un esito letale.

A seguito della somministrazione della dose, si effettuano osservazioni per lo studio dei relativi effetti.

Quando il livello di dose iniziale prescelto produce una tossicità evidente ma non mortalità dipendente dal composto, non è richiesta un'ulteriore prova.

Quando con la dose prescelta non si riscontra un'evidente tossicità, la sostanza sarà sottoposta ad un'ulteriore prova al livello di dosaggio immediatamente superiore. Se sopraggiunge la morte degli animali o se una grave reazione tossica richiede l'eutanasia dei medesimi, la sostanza deve essere nuovamente esaminata al livello di dosaggio immediatamente inferiore.

Questo procedimento consente l'identificazione della dose «discriminante» (vedi 1.2. Definizioni) cioè il massimo livello di dose che si può somministrare senza provocare la morte dell'animale (inclusi i sacrifici terminali).

Per gli animali che presentano segni gravi e continui di sofferenza fisica può rendersi necessaria l'eutanasia. Non si dovranno dosare le sostanze in maniera che provochino notoriamente gravi sofferenze per gli animali a causa delle proprietà corrosive ed irritanti.

1.5 CRITERI QUALITATIVI

Nessuno

1.6 DESCRIZIONE DEL METODO DI SAGGIO

1.6.1 Procedimenti

1.6.1.1 Animali da esperimento

Salvo controindicazioni, il ratto è la specie d'elezione.

Si dovranno impiegare ceppi utilizzati normalmente in laboratorio. Per ciascun sesso, all'inizio dell'esperimento, la variazione ponderale degli animali scelti non dovrebbe superare più o meno 20 % del valore medio.

Gli animali sono mantenuti nelle condizioni sperimentali di stabulazione e di alimentazione per almeno cinque giorni prima dell'esperimento. Gli animali, che dovranno essere giovani adulti, vengono scelti con metodo casuale e assegnati ai gruppi sperimentali dello studio di osservazione e dello studio principale (sebbene in pratica, per lo studio principale, possa anche bastare un solo gruppo di ogni sesso).

1.6.1.2. *Preparazione e somministrazione della dose*

Se necessario, la sostanza viene sciolta o sospesa in un veicolo adatto. Si raccomanda di considerare, ogni volta possibile, come prima scelta una soluzione acquosa, seguita da una soluzione in olio vegetale, e quindi in altri veicoli o in sospensione. Per i veicoli non acquosi è necessario conoscere le caratteristiche tossiche dei veicoli oppure determinarle prima o durante l'esperimento. Nei roditori, in genere, il volume non dovrà eccedere 10 ml/kg di peso corporeo a meno che non vengano utilizzate soluzioni acquose, nel qual caso si possono raggiungere i 20 ml/kg. La variabilità del volume di prova dovrà essere ridotta al minimo, regolando la concentrazione per garantire un volume costante a tutti i livelli di dosaggio.

Gli animali saranno tenuti a digiuno prima della somministrazione della sostanza. Al ratto non dovrebbe essere somministrato cibo durante la notte prima dell'esperimento mentre l'acqua resta disponibile ad libitum. Il giorno successivo si procederà alla pesatura degli animali e alla somministrazione della sostanza in un'unica dose mediante ingozzamento. Se un'unico dosaggio non è possibile, si può somministrare la dose in frazioni più piccole per un periodo non superiore alle 24 ore. Dopo la somministrazione della sostanza, il cibo può venire sospeso per altre tre-quattro ore. Se una dose è somministrata in frazioni durante un determinato periodo, potrà essere necessario fornire agli animali cibo e acqua in misura dipendente dalla durata del periodo di somministrazione.

1.6.2. *Procedimento*

1.6.2.1. *Studio di osservazione*

Gli effetti delle varie dosi sono osservati nelle singole cavia. Le femmine di animali saranno generalmente impiegate in assenza di informazioni indicanti che i maschi sono il sesso più sensibile. Il dosaggio è sequenziale, vale a dire si devono attendere almeno 24 ore prima di somministrare una dose al prossimo animale. Tutti gli animali sono sottoposti ad attenta osservazione per almeno 7 giorni per accertare eventuali sintomi di tossicità; se dopo 7 giorni persistono sintomi di moderata tossicità, l'animale dovrebbe essere osservato per altri 7 giorni. Si propongono i seguenti livelli di dose iniziale: 5, 50, 500 e 2 000 mg/kg. Se la dose iniziale prescelta non induce gravi sintomi di tossicità e il successivo livello superiore ha esito letale, sarà necessario stabilire uno o più livelli intermedi di dosaggio. In tal modo dovrebbe essere possibile ottenere delle informazioni sul livello o sui livelli che inducono sintomi di tossicità e sul livello di dose minima che provoca la morte della cavia.

Si dovrebbe cercare di stabilire la dose iniziale servendosi dei dati concernenti prodotti chimici affini. In mancanza di tali si suggerisce di cominciare con la dose di 500 mg/kg. Se non si osservano sintomi di tossicità dopo la somministrazione della dose iniziale si passerà al prossimo livello superiore. Qualora la dose di 2 000 mg/kg non abbia esito letale, lo studio di osservazione è da considerarsi terminato e lo studio principale sarà condotto a partire da tale livello. Se la dose iniziale (ad esempio 500 mg/kg) provoca gravi effetti che rendono necessaria l'eutanasia, al successivo animale sarà somministrata la dose immediatamente inferiore (ad esempio 50 mg/kg). Se l'animale sopravvive, ad altre cavia saranno somministrati appropriati livelli intermedi compresi fra le due dosi fisse. Normalmente, in questa fase, non dovrebbero essere impiegate più di 5 cavia.

1.6.2.2. *Studio principale*

Si dovranno impiegare almeno 10 animali (5 femmine e 5 maschi) per ciascun dosaggio. Le femmine saranno nullipare e non gravide.

L'utilizzazione dei dosaggi a moderata tossicità, costituisce un principio del metodo della dose fissa. Si dovrà quindi evitare di somministrare la sostanza in dosi letali.

Il livello di dosaggio dovrà essere scelto tra uno dei quattro livelli di dose fissi, cioè 5, 50, 500 o 2 000 mg/kg di peso corporeo. Il livello di dose iniziale prescelto dovrebbe essere quello suscettibile di produrre una tossicità evidente ma non la mortalità dipendente dal composto (inclusi i sacrifici terminali; le morti accidentali non

sono comprese ma dovrebbero essere registrate). Non è necessaria alcuna prova supplementare quando questo livello di dosaggio produce una tossicità evidente ma non mortalità dipendente dal composto.

Quando la somministrazione del livello di dose prescelto non provoca una tossicità evidente la sostanza dovrà essere ulteriormente esaminata al livello immediatamente superiore. Gli animali, tuttavia, continueranno ad essere tenuti sotto osservazione fino al completamento del periodo. Quando una grave reazione tossica richiede il sacrificio dell'animale o in caso di morte di quest'ultimo, la sostanza dovrà essere riesaminata al livello di dosaggio immediatamente inferiore. Gli animali che non devono essere uccisi saranno tenuti sotto controllo per l'intero periodo di osservazione.

Dopo la somministrazione, si effettuano le osservazioni e si registrano sistematicamente i risultati per ogni singolo animale.

Il periodo di osservazione dovrebbe essere di almeno 14 giorni. Tuttavia tale durata non è tassativa e dovrebbe dipendere dalla natura delle reazioni tossiche, dalla velocità del loro insorgere e dalla durata del periodo di recupero, se necessario il termine potrà essere quindi esteso. È importante osservare il momento in cui compaiono e scompaiono i segni di tossicità e il momento in cui sopraggiunge la morte, soprattutto se la sostanza in esame tende a causare tossicità ritardata.

Un attento esame clinico verrà effettuato almeno due volte nel giorno della somministrazione della dose ed almeno una volta al giorno per i giorni successivi. Gli animali che presentano segni gravi di sofferenza dovranno essere sacrificati. Si renderanno necessarie ulteriori osservazioni nei primi giorni successivi alla somministrazione qualora gli animali continuino a presentare segni di tossicità. L'esperimento può essere sospeso se risulta evidente che il livello della dose iniziale era troppo elevato.

Si osserveranno eventuali alterazioni della cute e del pelo, degli occhi e delle membrane mucose, nonché del sistema respiratorio, circolatorio, autonomo e centrale, dell'attività somatomotoria e delle caratteristiche comportamentali. Particolare attenzione sarà rivolta all'osservazione di tremori, convulsioni, salivazione, diarrea, letargia, sonno e coma.

Poco prima della somministrazione della sostanza, gli animali dovranno essere pesati individualmente e poi ogni giorno per tre giorni e successivamente una volta alla settimana. Gli animali che muoiono nel corso dell'esperimento e quelli che sopravvivono alla fine dello stesso vengono pesati e sottoposti a necropsia. Verranno registrate tutte le alterazioni patologiche evidenti. Se del caso, si prelevano dei tessuti per un esame istopatologico.

Potrà essere necessaria la somministrazione di un secondo, o in casi eccezionali di un terzo livello di dose in base ai risultati del precedente dosaggio.

Nel caso in cui una sostanza provochi mortalità ad un peso corporeo di 5 mg/kg (o quando uno «range finding test» indica che quel livello di dose causa mortalità) si dovrà procedere ad un ulteriore esame della tossicità acuta della sostanza.

2

DATI

I dati ottenuti dallo studio di osservazione e dallo studio principale vengono riassunti in una tabella indicante per ogni singolo livello di dose sperimentato il numero degli animali all'inizio dell'esperimento, il numero degli animali che presentano segni di tossicità, il numero degli animali trovati morti durante l'esperimento o sacrificati per motivi umanitari, una descrizione degli effetti tossici e, per lo studio principale, l'eventuale osservazione di una tossicità evidente connessa con il composto: il decorso nel tempo di qualsiasi effetto tossico ed i risultati della necropsia. Se la sopravvivenza supera un giorno, si procederà a calcolare e a registrare le variazioni di peso.

Gli animali sacrificati a causa di sofferenze dipendenti dal composto sono registrati sotto la voce «morti connesse con il composto».

3

RELAZIONE

3.1

RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni per lo studio di osservazione e lo studio principale:

- specie, ceppo, origine, condizioni ambientali, dieta, ecc.
- condizioni dell'esperimento,

- livelli di dosaggio (con veicolo, se utilizzato, e concentrazione);
- risultati esaurienti di tutti i livelli di dosaggio;
- tabulato dei dati risposta per sesso e livello di dosaggio (ad esempio numero di animali impiegati; variazioni del peso corporeo; eventualmente numero di animali morti o sacrificati nel corso dell'esperimento; numero di animali che presentano segni di tossicità; natura, gravità e durata degli effetti);
- velocità di insorgenza dei segni di tossicità e loro eventuale reversibilità;
- data in cui gli animali sono morti o sono stati sacrificati, data in cui è sopraggiunto il decesso dopo la somministrazione del dosaggio, motivi e criteri adottati per l'eutanasia degli animali;
- risultati dell'esame necroscopico;
- referti istopatologici;
- discussione dei risultati;
- interpretazione dei risultati inclusi i segni di una tossicità evidente e il livello di dosaggio discriminante individuato nell'esperimento.

3.2. VALUTAZIONE A INTERPRETAZIONE

DOSAGGIO	RISULTATI	INTERPRETAZIONE
5 mg/kg p.c.	sopravvivenza inferiore al 100 %	composti ALTAMENTE TOSSICI
	sopravvivenza del 100 %, tossicità evidente	composti TOSSICI
	sopravvivenza del 100 %, nessuna tossicità evidente	vedi risultati a 50 mg/kg
50 mg/kg p.c.	sopravvivenza inferiore al 100 %	composti che possono risultare TOSSICI o ALTAMENTE TOSSICI. Vedi risultati a 5 mg/kg
	sopravvivenza del 100 %, tossicità evidente	composti NOCIVI
	sopravvivenza del 100 %, nessuna tossicità evidente	vedi risultati a 500 mg/kg
500 mg/kg p.c.	sopravvivenza inferiore al 100 %	composti che possono risultare TOSSICI o NOCIVI. Vedi risultati 50 mg/kg
	sopravvivenza del 100 %, tossicità evidente	composti considerati come non comportanti una tossicità acuta di rilievo
	sopravvivenza del 100 %; nessuna tossicità evidente	vedi risultati a 2 000 mg/kg
2 000 mg/kg p.c.	sopravvivenza inferiore al 100 %	vedi risultati a 500 mg/kg
	sopravvivenza del 100 % con o senza tossicità evidente	composti che non inducono una tossicità acuta

B.1 tris TOSSICITÀ ACUTA PER VIA ORALE — METODO DELLA CLASSE DI TOSSICITÀ ACUTA

1 METODO

1.1 Introduzione

Il metodo della classe di tossicità acuta fornisce informazioni per la valutazione e la classificazione dei rischi.

Il metodo utilizza tre dosi fisse, adeguatamente distinte in modo da consentire la classificazione della sostanza in base ai risultati dello studio. Inoltre la procedura descritta prevede la possibilità di scegliere tre dosi fisse supplementari, che possono essere utilizzate quale opzione alternativa in determinate fasi decisionali o per l'esecuzione di ulteriori esperimenti. L'utilizzo di (una di dette) dosi supplementari può essere previsto nei casi in cui sia auspicabile o necessaria una valutazione più accurata.

Il metodo, che utilizza dosi iniziali definite, non ha lo scopo di determinare una LD_{50} precisa, ma è inteso a stabilire un range di esposizione potenzialmente letale. La morte di una certa percentuale di animali costituisce infatti il principale parametro preso in esame dal saggio in questione. I risultati del test dovrebbero consentire una classificazione secondo i criteri enunciati nell'allegato VI. Dato l'approccio sequenziale del metodo, la durata del saggio potrebbe essere superiore a quella della procedura descritta al punto B.1. Il principale vantaggio di questo metodo è che esso richiede un minor numero di animali rispetto al metodo di tossicità orale acuta (B.1) e al metodo alternativo a dose fissa (B.1 bis).

Vedi anche introduzione generale, parte B.

1.2 Definizioni

Vedi introduzione generale, parte B.

1.3 Principio del metodo di saggio

La sostanza viene somministrata per via orale ad un gruppo di animali da laboratorio in una delle dosi definite. Essa viene saggiata secondo una procedura composta da diverse fasi, per ciascuna delle quali vengono utilizzati tre animali dello stesso sesso. Non è necessario eseguire uno studio di osservazione preliminare. Il fatto che in una fase si abbia o meno mortalità degli animali trattati indotta dalla sostanza determinerà la fase successiva.

- il saggio verrà sospeso
- la fase successiva sarà effettuata con lo stesso dosaggio, ma con animali dell'altro sesso
- la fase successiva sarà effettuata con il livello di dosaggio immediatamente superiore o inferiore

1.4 Descrizione del metodo di saggio

1.4.1 Preparazioni

Animali adulti giovani e sani vengono scelti in modo casuale, marchiati per consentirne l'individuazione e mantenuti nelle loro gabbie per almeno 5 giorni prima dell'inizio del saggio, in modo da potersi acclimatare alle condizioni di laboratorio. Gli animali possono essere raggruppati in funzione del sesso e del dosaggio, ma il numero di animali per gabbia non deve essere tale da impedire la corretta osservazione di ogni esemplare.

La sostanza da saggiare viene somministrata in un'unica dose mediante sonda gastrica o cannula per intubazione.

Se necessario, la sostanza da saggiare viene disciolta o sospesa in un veicolo adatto. Ove possibile, si preferirà una soluzione/sospensione acquosa, o, come seconda alternativa, una soluzione/emulsione in olio (per esempio olio di mais), o ancora, infine, una soluzione in altri veicoli. Per i veicoli non acquosi, le caratteristiche di tossicità del veicolo dovranno essere note o, in caso contrario, determinate prima del saggio.

Gli animali dovranno essere tenuti a digiuno prima della somministrazione della sostanza (a partire dalla sera precedente per il ratto e tre-quattro ore prima per il topo), ma potranno continuare ad essere abbeverati.

1.4.2. *Condizioni sperimentali*1.4.2.1 *Animali da esperimento*

Salvo controindicazione, il ratto è la specie d'elezione. Le femmine dovranno essere nullipare e non gravide.

All'inizio dello studio, la variazione di peso degli animali dovrà essere minima e non essere superiore al ± 20 per cento del peso medio per ogni sesso.

1.4.2.2 *Numero e sesso*

Per ogni fase del saggio vengono utilizzati tre animali dello stesso sesso. Nella fase iniziale può essere utilizzato uno qualsiasi dei due sessi.

1.4.2.3 *Livelli di dosaggio*

Il livello iniziale di dosaggio sarà una delle tre dosi fisse, vale a dire 25, 200 e 2 000 mg/kg di peso corporeo. La dose iniziale dovrà essere quella più suscettibile di cagionare la morte di almeno una parte degli animali trattati. In funzione della dose iniziale si utilizzerà uno degli schemi descritti nell'allegato I.

Per la scelta del sesso e della dose iniziale dovranno essere utilizzate tutte le informazioni disponibili, comprese quelle concernenti le relazioni struttura-attività. Qualora, alla luce di tali informazioni, la mortalità risulti improbabile al livello massimo di dosaggio (2 000 mg/kg di peso corporeo), si potrà fare ricorso ad un saggio limite. In mancanza di informazioni su una sostanza da saggiare, per il benessere degli animali si raccomanda l'uso della dose iniziale di 200 mg/kg di peso corporeo.

In alcuni casi può essere opportuno acquisire più informazioni rispetto a quelle fornite dal saggio che prevede la somministrazione di tre dosi fisse di 25, 200 e 2 000 mg/kg di peso corporeo. In questa eventualità si potrà proseguire lo studio somministrando dosi supplementari fisse rispettivamente di 5, 50 o 500 mg/kg di peso corporeo.

Dovrà essere possibilmente evitata la somministrazione di dosaggi suscettibili di cagionare sofferenze gravi per effetto delle proprietà corrosive o irritanti delle sostanze.

L'intervallo di tempo che intercorre tra il trattamento dei diversi gruppi viene determinato in funzione dell'esordio, della durata e della gravità dei segni di tossicità. Si avrà cura di procedere al trattamento degli animali dell'altro sesso o alla somministrazione della dose successiva in un altro gruppo di animali solo una volta accertata la sopravvivenza degli animali precedentemente trattati.

1.4.2.4 *Saggio limite*

È possibile eseguire un saggio limite ad un unico livello di dosaggio di 2 000 mg/kg di peso corporeo su tre animali per sesso. Qualora si osservi una mortalità correlata con la sostanza, può essere necessario proseguire il saggio con una dose di 200 mg/kg (o 500 mg/kg) di peso corporeo.

1.4.2.5 *Periodo di osservazione*

Di norma gli animali devono essere tenuti in osservazione per un periodo di 14 giorni, eccetto nel caso in cui sia preferibile escluderli dallo studio e sottoporli ad eutanasia o qualora vengano rinvenuti morti. Tuttavia tale durata non deve essere tassativa. Essa dipenderà dalla natura delle reazioni tossiche, dalla velocità del loro insorgere e dalla durata del periodo di recupero e, se necessario, potrà essere prolungata. Un parametro importante è rappresentato dal momento della comparsa e della scomparsa dei segni di tossicità, soprattutto in caso di insorgenza tardiva. Tutte le osservazioni devono essere registrate su schede individuali per ogni animale.

1.4.3 *Procedimento*

Dopo il periodo di digiuno e prima della somministrazione della sostanza da saggiare, gli animali vengono pesati. A somministrazione avvenuta, il cibo può essere sospeso per altre 3-4 ore. Qualora la stessa dose venga frazionata e somministrata durante un certo periodo di tempo, può essere necessario nutrire e abbeverare gli animali in misura adeguata alla durata del periodo di somministrazione.

Il volume massimo di liquidi somministrabile in un'unica volta dipende dalla taglia dell'animale da esperimento. Nei roditori esso non dovrebbe essere superiore ad 1 ml/100 g di peso corporeo; tuttavia per le soluzioni acquose sono ammessi 2 ml/100 g di peso corporeo. La variabilità del volume di liquidi da somministrare dovrebbe essere ridotta al minimo correggendo la concentrazione in modo che tutti i livelli di dosaggio abbiano un volume costante. Qualora non sia possibile somministrare l'intera quantità con una singola dose, si procederà alla somministrazione ripetuta di piccole frazioni di essa durante un periodo non superiore a 24 ore.

Lo schema procedurale dettagliato è descritto nell'allegato I.

1.4.3.1 Osservazioni generali

Accurate osservazioni cliniche dovranno essere effettuate almeno due volte nel giorno stesso della somministrazione, o più frequentemente se la reazione degli animali lo richiede, e successivamente almeno una volta al giorno. Gli animali moribondi o recanti segni gravi e persistenti di sofferenza dovranno essere sottoposti ad eutanasia. In questo caso esse saranno assimilate agli animali andati incontro a morte spontanea durante l'esperimento.

Nel caso di animali sottoposti ad eutanasia o rinvenuti morti, il momento del decesso dovrà essere registrato con la massima precisione possibile. Ulteriori osservazioni saranno necessarie qualora gli animali presentino segni persistenti di tossicità. Dette osservazioni comprenderanno le modificazioni della cute e del pelo, degli occhi e delle mucose, del sistema respiratorio e circolatorio, del sistema nervoso autonomo e centrale, dell'attività somatomotoria e del comportamento. Particolare attenzione sarà rivolta all'osservazione di tremori, convulsioni, salivazione, diarrea, letargia, sonno e coma.

Tutte le osservazioni saranno sistematicamente registrate su schede individuali per ogni animale.

1.4.3.2 Peso corporeo

Tutti gli animali saranno pesati poco prima della somministrazione della sostanza da saggiare e almeno una volta alla settimana successivamente. Le variazioni ponderali dovranno essere calcolate e registrate. Al termine del saggio gli animali sopravvissuti saranno pesati prima di essere sottoposti ad eutanasia.

1.4.3.3 Necropsia macroscopica

Tutti gli animali da esperimento, compresi quelli morti durante il saggio o da esso esclusi, dovranno essere sottoposti a necropsia macroscopica. Per ogni animale si registreranno tutte le modificazioni patologiche di rilievo. Per gli animali sopravvissuti per almeno 24 ore, l'esame microscopico degli organi recanti alterazioni patologiche evidenti potrebbe fornire indicazioni utili ed essere quindi opportuno.

2 DATI

Dovranno essere forniti i dati individuali di ciascun animale. Inoltre, tutti i dati dovranno essere riassunti in una tabella indicante, per ogni gruppo di saggio, il numero di animali utilizzati, il numero di animali recanti segni di tossicità, il numero di animali rinvenuti morti durante il saggio o sottoposti ad eutanasia, il momento del decesso di ciascun animale, la descrizione degli effetti tossici con indicazione del momento della loro comparsa, decorso e reversibilità, e i risultati della necropsia.

Indicazioni generali sull'interpretazione dei risultati ai fini della loro classificazione sono riportate nell'allegato 2.

3 RELAZIONE**Relazione sul saggio**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

Animali da esperimento

- specie/ceppo,
- condizioni microbiologiche degli animali qualora siano note,
- numero, età e sesso degli animali,
- origine, condizioni di alloggiamento, dieta ecc.,
- peso di ciascun animale determinato all'inizio del saggio, con cadenza settimanale nel periodo successivo e al termine del saggio.

Condizioni sperimentali

- motivazione della scelta del veicolo utilizzato, se diverso dall'acqua,
- modalità precise di somministrazione della sostanza in esame, compresi i volumi di dosaggio e il momento della somministrazione,
- caratteristiche della qualità del cibo e dell'acqua (compresi tipo/origine, origine dell'acqua)
- motivazione della scelta del dosaggio iniziale.

Risultati.

- tabulato dei dati di risposta per sesso e livello di dosaggio per ciascun animale (vale a dire animali recanti segni di tossicità, mortalità compresa; natura, gravità e durata degli effetti),
- momento della comparsa dei segni di tossicità, loro decorso ed eventuale reversibilità per ogni animale;
- risultati della necropsopia ed eventuali altri reperti istopatologici per ogni animale.

*Discussione dei risultati.**Conclusioni.*4. **RIFERIMENTI**

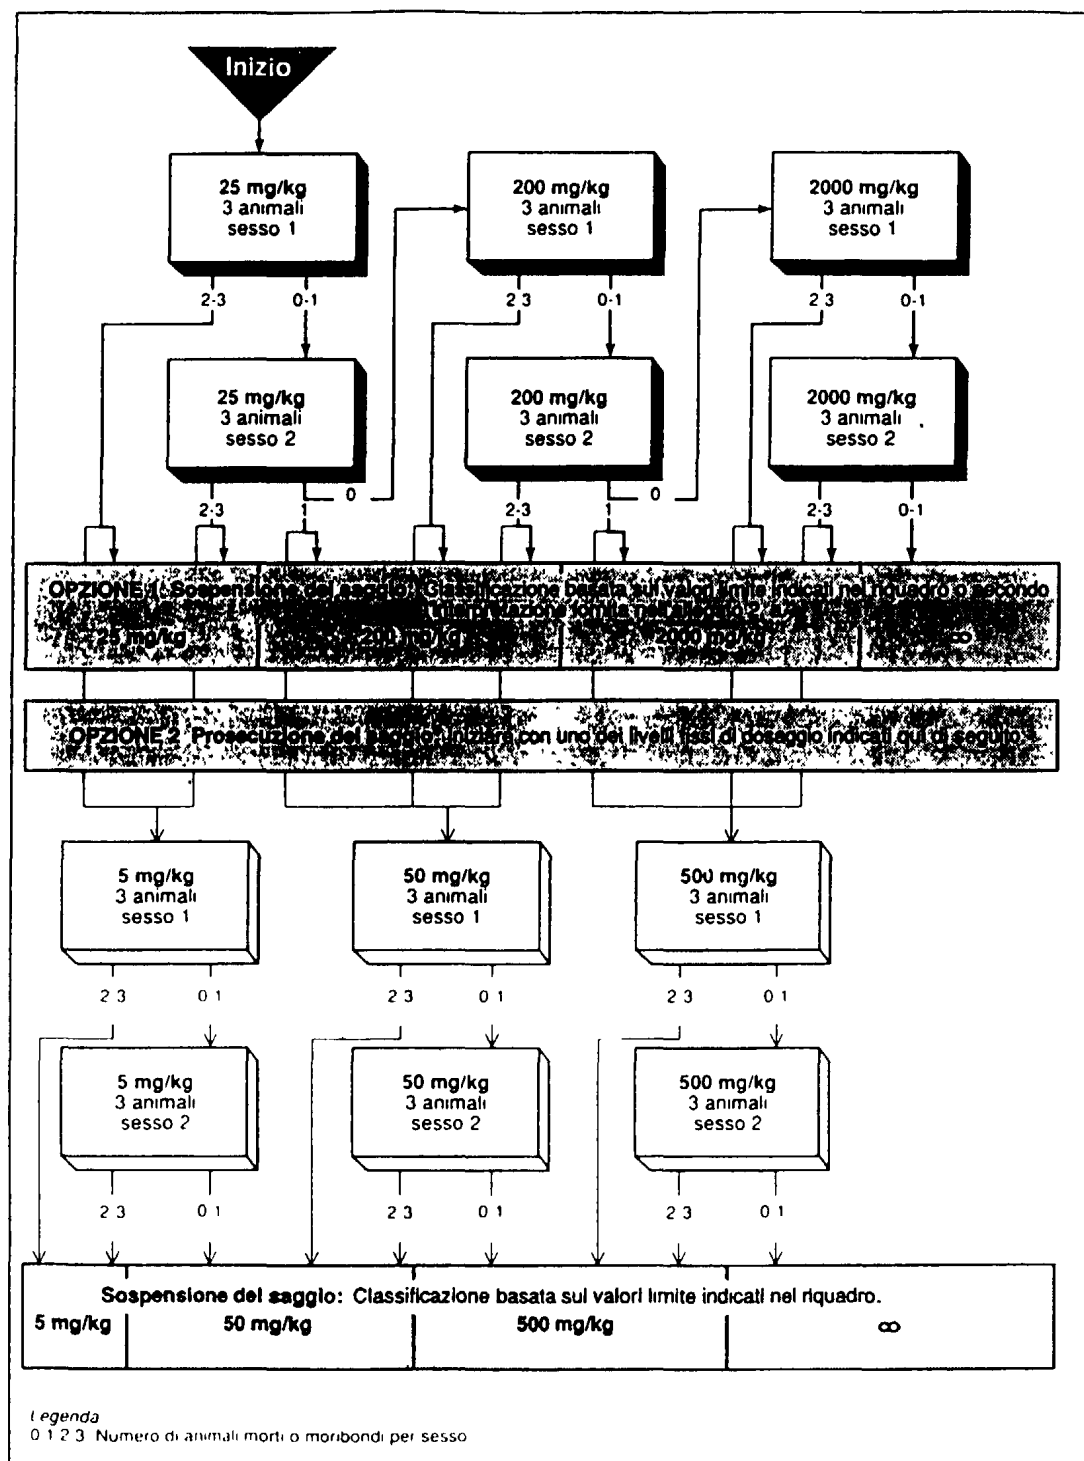

Il presente metodo corrisponde al metodo OCSE TG 423.

ALLEGATO 1

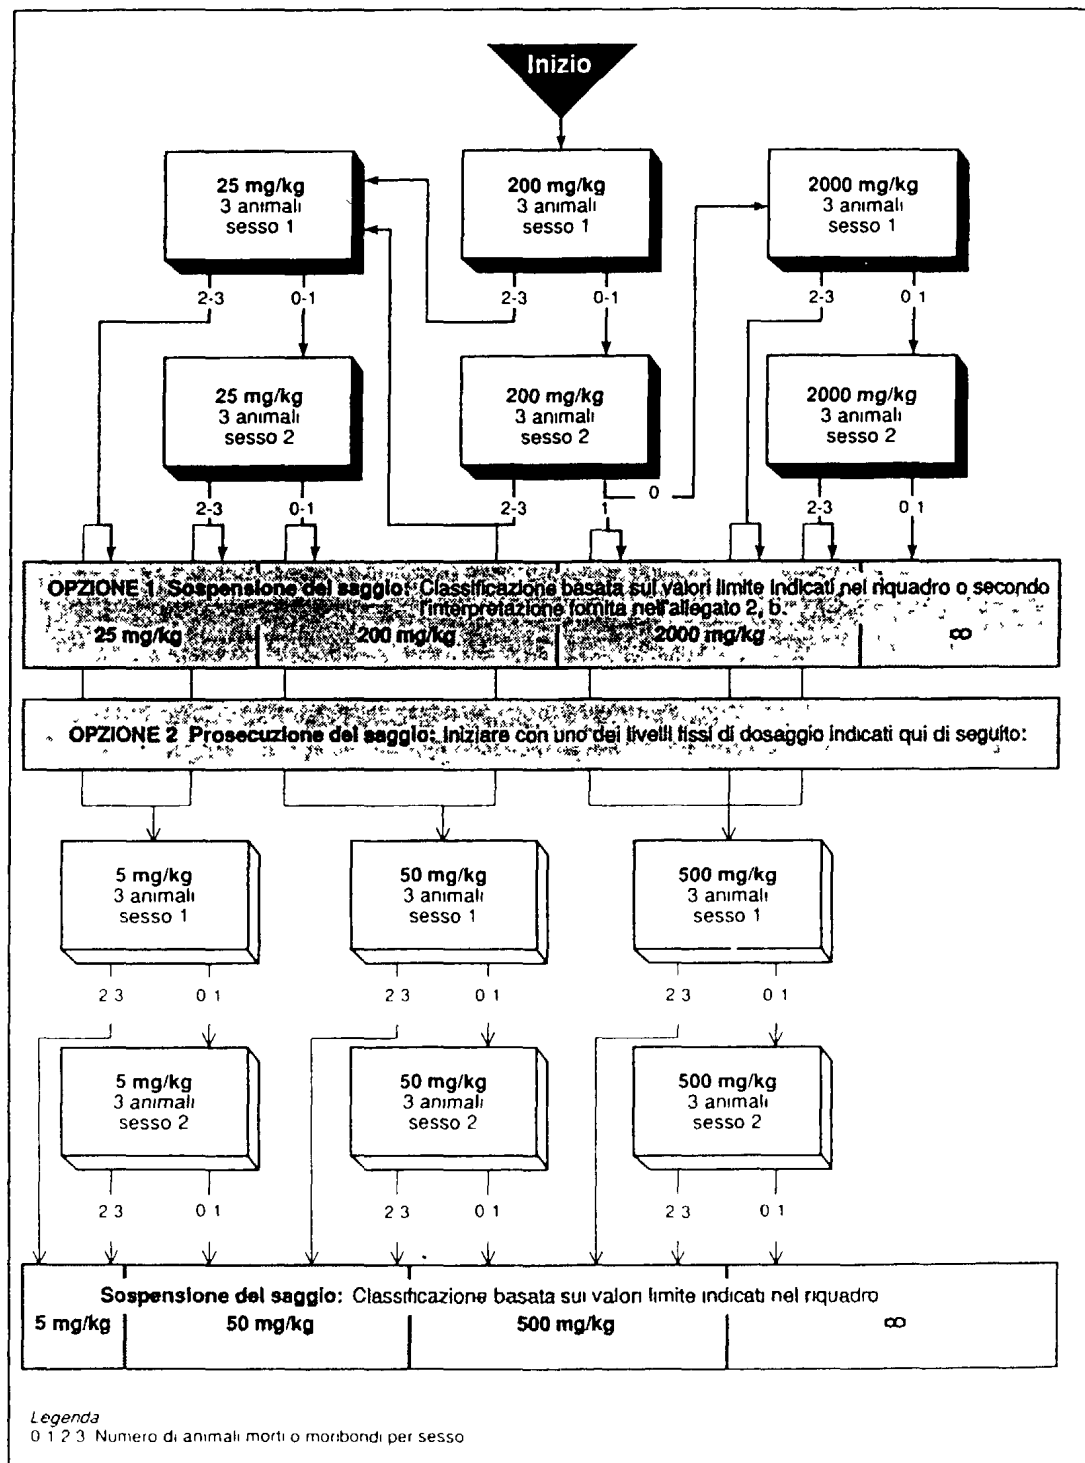

SCHEMA PROCEDURALE

- 1 Come indicato al paragrafo 1.4.2.3, la dose iniziale dovrà essere quella più suscettibile di cagionare la morte di almeno una parte degli animali trattati. La scelta della dose iniziale sarà effettuata in funzione dei seguenti parametri:
 - dati concernenti le proprietà fisico-chimiche,
 - relazione struttura-attività,
 - tutti i dati forniti da altri saggi di tossicità, e
 - uso previsto della sostanza.
- 2 Per ogni dose iniziale, gli schemi riportati nel presente allegato definiscono il procedimento da seguire. In funzione del numero di animali morti o sottoposti ad eutanasia, il procedimento da seguire è indicato da frecce.
- 3 Nel caso in cui alla dose iniziale di 25 o 200 mg/kg di peso corporeo si riscontri il decesso di un solo animale del secondo sesso, di norma non dovranno essere effettuate altre somministrazioni. Tuttavia, qualora gli altri cinque animali non presentino segni di tossicità, al momento dell'autopsia si dovrà prendere in considerazione l'ipotesi che la morte non sia stata cagionata dalla sostanza. In tal caso, si dovrà proseguire l'esperimento con la somministrazione del dosaggio immediatamente superiore.
- 4 Nel caso in cui alla dose di 2.000 mg/kg di peso corporeo si riscontri il decesso di un animale per sesso, è lecito desumere che la DL_{50} sia superiore a 2.000 mg/kg di peso corporeo. Tuttavia, trattandosi di un risultato borderline, è opportuno osservare attentamente la risposta degli altri due animali per sesso: l'eventuale comparsa di segni chiari e marcati di tossicità in detti animali potrebbe infatti condurre ad una classificazione corrispondente ad una DL_{50} uguale o inferiore a 2.000 mg/kg di peso corporeo o giustificare l'esecuzione di ulteriori prove con il medesimo dosaggio.
- 5 Il procedimento prevede la possibilità di somministrare tre dosi fisse supplementari (opzione 2). Tale opzione può essere utilizzata per selezionare una dose alternativa in una determinata fase decisionale del saggio, o effettuare ulteriori esperimenti una volta ultimato il saggio in questione (opzione 1). Lo schema procedurale dell'opzione 1 è indicato da frecce in grassetto, quello dell'opzione 2 da frecce normali.

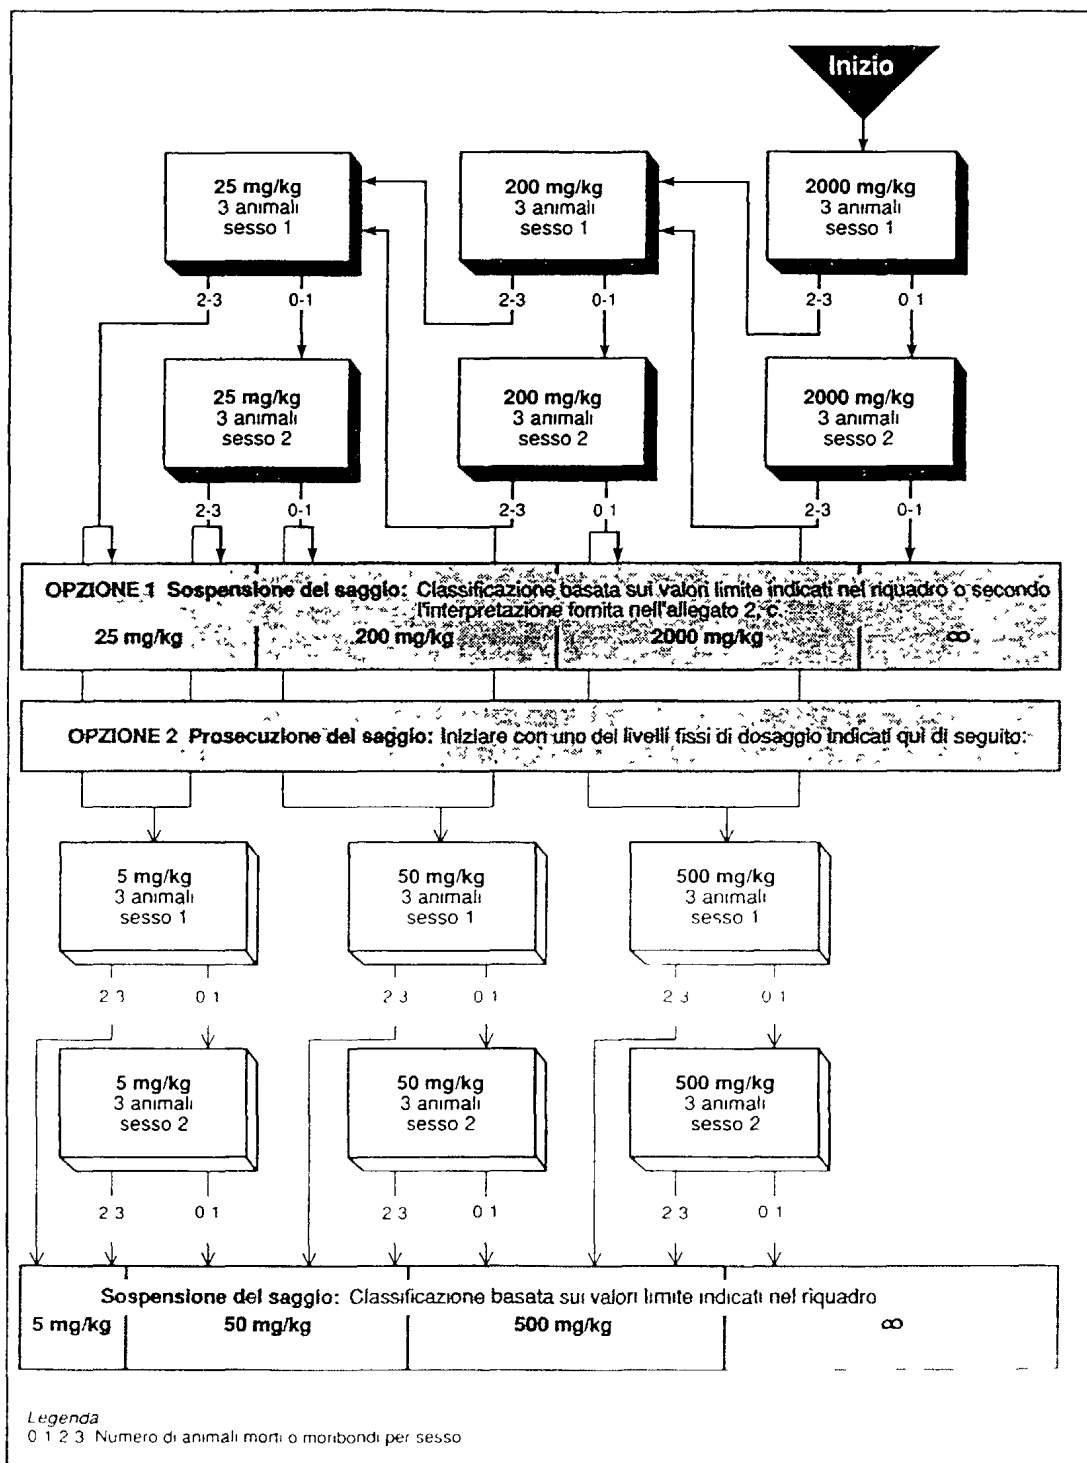

a) Schema procedurale con una dose iniziale di 25 mg/kg di peso corporeo

b) Schema procedurale con una dose iniziale di 200 mg/kg di peso corporeo

c) Schema procedurale con una dose iniziale di 2 000 mg/kg di peso corporeo

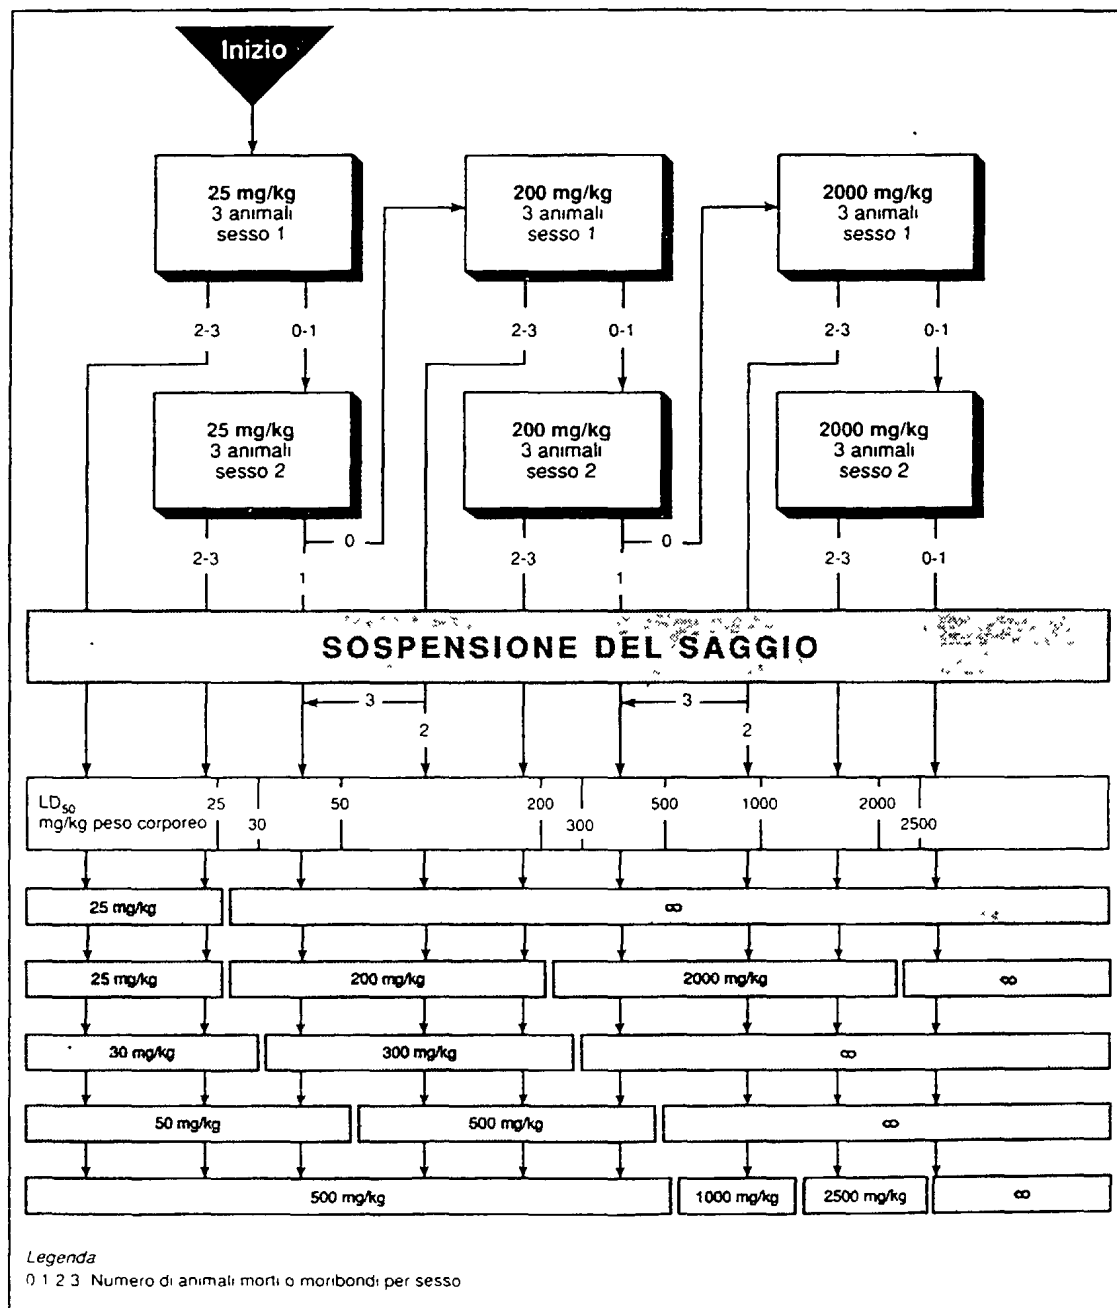

ALLEGATO 2

INTERPRETAZIONE DEI RISULTATI IN BASE AL PROCEDIMENTO PREVISTO DALL'OPZIONE 1

Negli schemi riportati nel presente allegato, i riquadri grigi posti sotto il riquadro «sospensione del saggio» recano i valori limite per la classificazione. Secondo lo schema procedurale previsto dall'opzione 1, si segue l'apposita freccia verso il basso fino a raggiungere il riquadro grigio appropriato.

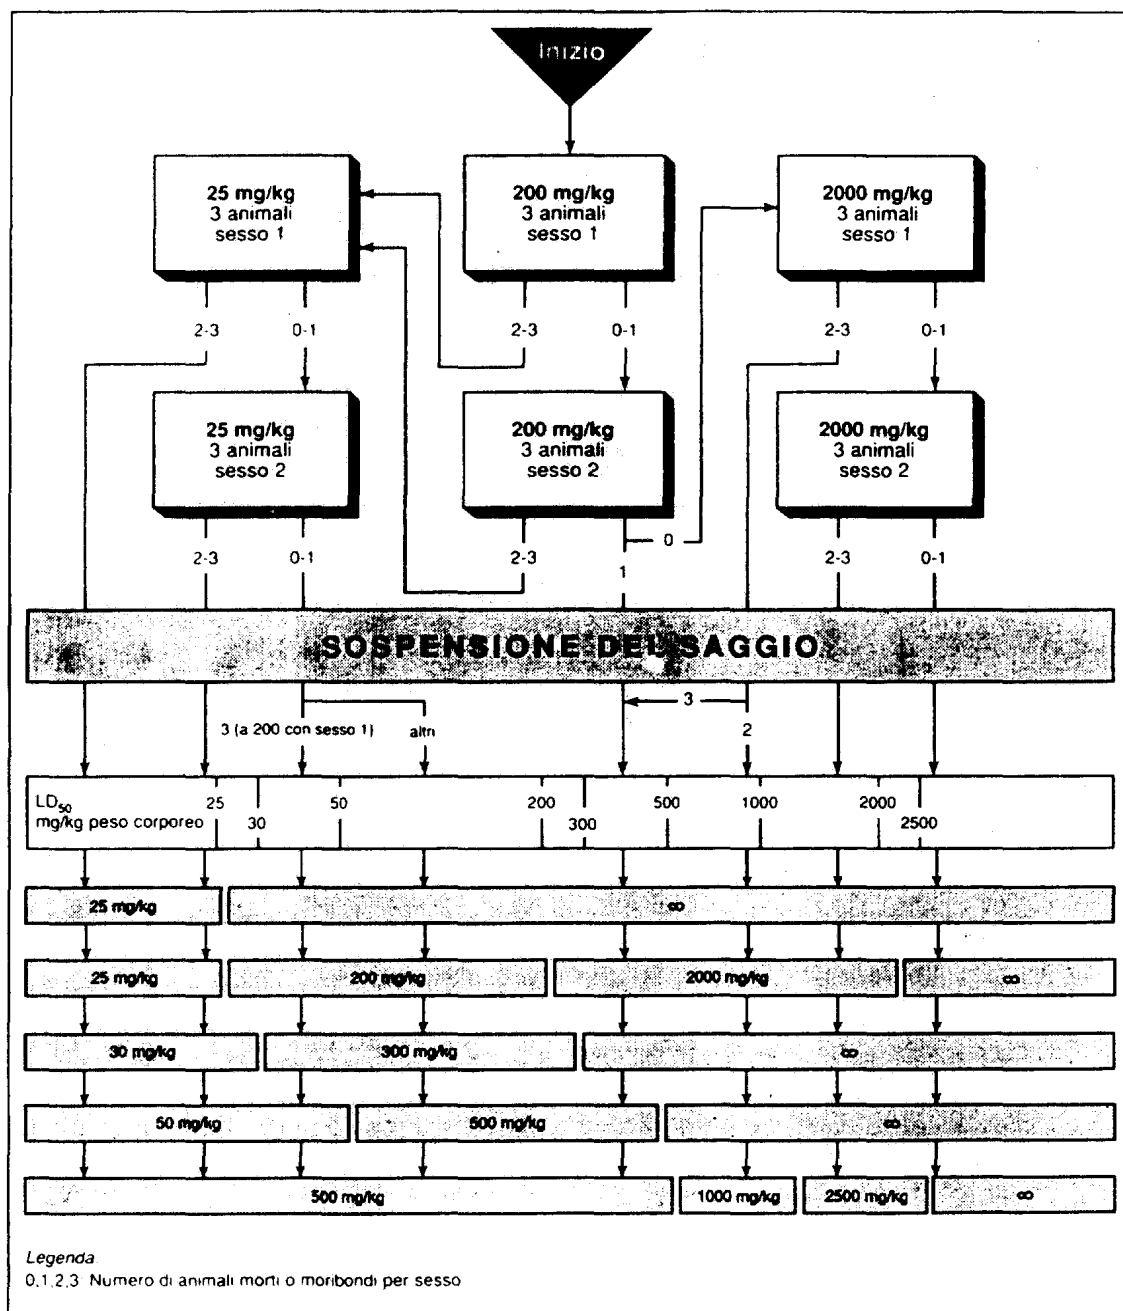

a) Interpretazione dei risultati in base al procedimento previsto dall'opzione 1

Dose iniziale: 25 mg/kg di peso corporeo

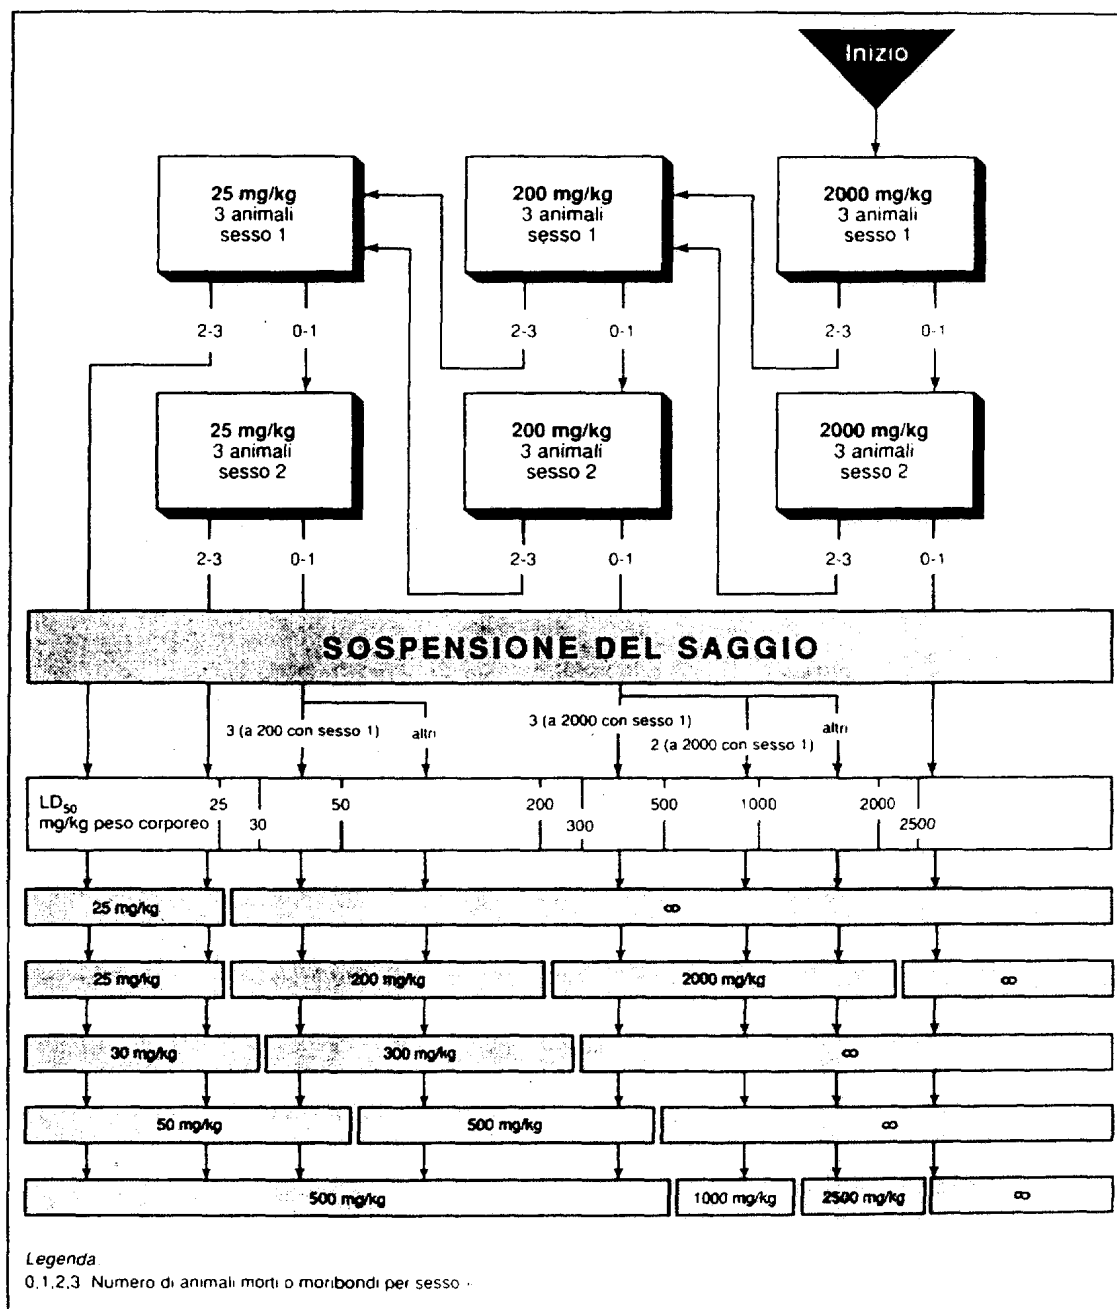

b) Interpretazione dei risultati in base al procedimento previsto dall'opzione 1

Dose iniziale: 200 mg/kg di peso corporeo

c) Interpretazione dei risultati in base al procedimento previsto dall'opzione 1

Dose iniziale: 2 000 mg/kg di peso corporeo

B.2. TOSSICITÀ ACUTA PER INALAZIONE

1 METODO

1.1. INTRODUZIONE

È utile avere informazioni preliminari sulla distribuzione della dimensione delle particelle, la tensione di vapore, il punto di fusione, punto di ebollizione, il punto di infiammabilità e l'esplosività (se del caso) della sostanza.

Si veda anche introduzione generale, parte B

1.2. DEFINIZIONI

Vedi introduzione generale, parte B

1.3. SOSTANZE DI RIFERIMENTO

Nessuna.

1.4. PRINCIPIO DEL METODO DI SAGGIO

Diversi gruppi di animali da esperimento sono esposti a concentrazioni graduate della sostanza in esame per un determinato periodo di tempo (una concentrazione per gruppo). Si procede poi all'osservazione degli effetti e degli eventi letali. Gli animali che muoiono durante l'esperimento sono sottoposti a necropsopia e quelli che sopravvivono sono sottoposti a necropsopia alla fine dell'esperimento.

Può essere necessario sopprimere umanamente gli animali che mostrano segni gravi e persistenti di sofferenza e di dolore. Non è necessario eseguire la somministrazione di dosi delle sostanze in esame in una maniera che può provocare dolore e sofferenza marcate a motivo di proprietà corrosive o gravemente irritanti.

1.5. CRITERI DI QUALITÀ

Nessuno.

1.6. DESCRIZIONE DEL METODO DI SAGGIO

1.6.1. Preparazioni

Prima del saggio gli animali sono tenuti nelle condizioni di stabulazione e di alimentazione dell'esperimento per un periodo di almeno 5 giorni. Prima del saggio gli animali, che dovranno essere giovani adulti e sani sono scelti con metodo casuale e assegnati ai gruppi necessari per il saggio. Non è necessario sottoporre gli animali a una esposizione simulata, a meno che ciò non sia richiesto dal tipo di dispositivo utilizzato per l'esposizione.

Le sostanze di prova solide possono richiedere una micronizzazione allo scopo di ottenere particelle di dimensione appropriata.

Ove necessario, alla sostanza in esame può essere aggiunto un veicolo idoneo per facilitare una concentrazione appropriata della sostanza in esame nell'atmosfera e, in tal caso, deve essere utilizzato un gruppo di controllo per il veicolo. Se per facilitare il dosaggio si impiega un veicolo o altri additivi, questi non dovrebbero produrre effetti tossici. Se appropriato, possono essere utilizzati dati storici.

1.6.2. Condizioni per il saggio

1.6.2.1. *Animali da esperimento*

Salvo controindicazioni, il ratto è la specie d'elezione. Si dovrebbero utilizzare ceppi di laboratorio comunemente usati. Per ciascun sesso, all'inizio del saggio la variazione ponderale degli animali utilizzati non dovrebbe superare del $\pm 20\%$ il valore medio.

1 6 2 2 *Numero e sesso*

Per ogni livello di concentrazione vengono utilizzati almeno dieci roditori (5 di sesso femminile e 5 di sesso maschile). Le femmine dovrebbero essere nullipare e non gravide.

Nota nei saggi di tossicità acuta con animali di ordine superiore ai roditori, si dovrebbe prendere in considerazione l'uso di un numero minore di animali.

Le dosi devono essere accuratamente scelte e si deve fare ogni sforzo possibile per non superare dosi moderatamente tossiche. In tali prove si dovrebbe evitare la somministrazione di dosi letali della sostanza in esame.

1 6 2 3 *Concentrazioni di esposizione*

Queste dovranno essere in numero sufficiente, almeno tre, e opportunamente intervallate, onde produrre nei gruppi trattati una graduazione di effetti tossici e di mortalità. I risultati dovrebbero essere sufficienti per fornire una curva mortalità-concentrazione e, quando possibile, permettere un'accettabile determinazione della CL_{50} .

1 6 2 4 *Saggio limite*

Se un'esposizione di 5 animali maschi e di 5 animali femmine da esperimento per 4 ore a 20 mg/l di un gas o 5 mg/l di un aerosol o di una sostanza particellata (o, se ciò non è possibile, a causa di proprietà fisiche o chimiche, comprese quelle esplosive della sostanza in esame, alla concentrazione massima raggiungibile) non provoca entro 14 giorni mortalità legata al composto in esame, si può considerare che non sono necessarie ulteriori prove.

1.6.2.5 *Tempo di esposizione*

Il periodo di esposizione dovrà essere di 4 ore.

1.6.2.6 *Attrezzatura*

Gli animali dovranno essere sottoposti all'esperimento con dispositivi per l'inalazione appositamente progettati per consentire un flusso d'aria dinamico di almeno 12 ricambi d'aria all'ora, per assicurare un adeguato contenuto di ossigeno e un'atmosfera di esposizione distribuita uniformemente. Qualora sia usata una camera, essa dovrà essere progettata in modo da evitare l'affollamento degli animali, da esperimento e al tempo stesso rendere massima l'esposizione alla sostanza in esame mediante inalazione. Come regola generale, onde garantire la stabilità dell'atmosfera nella camera, il «volume» complessivo degli animali del saggio non dovrebbe superare il 5 % di quello della camera di saggio. Si può ricorrere ad una esposizione oro-nasale, della sola testa o di tutto il corpo in camera singola; le prime due modalità di esposizione aiuteranno a rendere minimo l'assorbimento delle sostanze attraverso altre vie.

1.6.2.7 *Periodo di osservazione*

Il periodo di osservazione dovrebbe essere di almeno 14 giorni. Tuttavia la durata dell'osservazione non dovrebbe essere fissata rigidamente. Essa dovrebbe essere determinata dalla natura delle reazioni tossiche, dalla velocità del loro insorgere e dalla durata del periodo di recupero; essa può, quindi, essere estesa se considerato necessario. Il momento in cui si manifestano e scompaiono i sintomi di tossicità e quello nel quale interviene il decesso, sono importanti, soprattutto quando la sostanza tenda a causare mortalità ritardata.

1.6.3 *Procedimento*

Gli animali sono pesati poco prima dell'esposizione e quindi esposti alla concentrazione di saggio nell'apposito dispositivo, per un periodo di 4 ore, dopo aver effettuato l'equilibramento della concentrazione nella camera di inalazione. Il tempo di equilibramento dovrebbe essere breve. Il saggio dovrebbe essere effettuato ad una temperatura di $22^{\circ}\text{C} \pm 3^{\circ}\text{C}$. Da un punto di vista ottimale l'umidità relativa dovrebbe essere mantenuta tra il 30 e il 70 % ma, in taluni casi (ad esempio, prove di aerosol), ciò può non essere realizzabile. Mantenendo una pressione leggermente negativa all'interno della camera (≥ 5 mm di acqua) si impedirà un trafilamento della sostanza in esame nell'area circostante. Durante l'esposizione, la somministrazione di cibo e acqua deve essere sospesa. Si devono usare sistemi adatti per la generazione e il controllo dell'atmosfera d'esame. Il sistema dovrà assicurare che condizioni di esposizione stabili vengano realizzate il più rapidamente possibile. La camera deve essere progettata e fatta funzionare in modo da mantenere una distribuzione omogenea dell'atmosfera sperimentale all'interno della camera.

Si dovranno misurare o controllare

(a) la velocità del flusso d'aria (in continuo)

(b) la concentrazione effettiva della sostanza in esame misurata nella zona di respirazione almeno tre volte durante l'esposizione (alcune atmosfere, per esempio aerosol ad alta concentrazione, possono richiedere un controllo più frequente). Durante il periodo di esposizione, la concentrazione non dovrebbe variare più del $\pm 15\%$ del valore medio. Tuttavia nel caso di alcuni aerosol questo livello di regolazione può non essere realizzabile, e in tal caso è accettabile un intervallo più ampio. Per gli aerosol, si deve eseguire con la frequenza necessaria (almeno una volta per gruppo di prova) l'analisi della dimensione delle particelle

(c) temperatura e umidità, in continuo se possibile

Durante e dopo l'esposizione, si procede all'effettuazione e alla registrazione sistematica delle osservazioni effettuate, registrazioni individuali dovranno essere tenute per ciascun animale. Durante il primo giorno le osservazioni dovrebbero essere frequenti. Un attento esame clinico dovrà essere effettuato almeno una volta al giorno per cinque giorni per settimana. Altre osservazioni dovranno essere effettuate quotidianamente con azioni appropriate per minimizzare la perdita di animali da studiare, ad esempio necropsia e refrigerazione degli animali trovati morti e isolamento o sacrificio degli animali deboli e moribondi.

Le osservazioni dovrebbero comprendere le alterazioni della cute e del pelo, degli occhi, delle membrane mucose e del sistema respiratorio, circolatorio, nervoso autonomo e centrale, dell'attività somatomotoria e del comportamento dell'animale. Particolare attenzione dovrebbe essere rivolta all'osservazione del comportamento respiratorio, di tremori, convulsioni, salivazione, diarrea, letargia, sonno e coma. Il momento in cui sopraggiunge il decesso dell'animale dovrà essere registrato con la massima precisione possibile. I valori ponderali degli animali dovranno essere determinati settimanalmente dopo l'esposizione e al momento del decesso.

Gli animali che muoiono durante il saggio e quelli che sopravvivono a conclusione dello stesso sono sottoposti a necropsia con particolare riferimento alle alterazioni del tratto respiratorio superiore e inferiore. Si dovranno registrare tutti i cambiamenti patologici macroscopici. Ove del caso, i tessuti dovrebbero essere prelevati per l'esame istopatologico.

2 DATI

I dati dovranno essere riassunti in una tabella indicante per ogni gruppo di saggio il numero di animali all'inizio del saggio, il momento del decesso di ciascun animale, il numero di animali che presentano altri sintomi di tossicità, la descrizione degli effetti tossici e i risultati della necropsia. Le variazioni ponderali devono essere calcolate e registrate quando la sopravvivenza sia superiore ad un giorno. Gli animali che sono soppressi per motivi umanitari in conseguenza di sofferenze e dolore dovuti al composto sono registrati come morti dovute al composto. La CL_{50} dovrà essere determinata con un metodo riconosciuto. La valutazione dei dati dovrà comprendere il rapporto, se esistente, tra l'esposizione degli animali alla sostanza in esame e l'incidenza e gravità di tutte le alterazioni incluse quelle comportamentali e cliniche, le lesioni macroscopiche, le variazioni del peso corporeo, la mortalità e qualsiasi altro effetto tossico.

3 RELAZIONE

3.1 RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- specie, ceppo, origine degli animali, condizioni ambientali, dieta ecc.,
- condizioni del saggio

descrizione dell'apparecchiatura usata per l'esposizione, incluso il modello, il tipo, le dimensioni, la sorgente d'aria, il sistema per la generazione degli aerosol, il metodo di condizionamento dell'aria e il metodo di alloggiamento degli animali nella camera di prova quando questa venga usata. Si dovrà descrivere anche l'apparecchiatura per la misura della temperatura, dell'umidità e della concentrazione di aerosol e della distribuzione delle dimensioni delle particelle di aerosol.

Dati sull'esposizione

Questi dati dovranno essere raccolti in tabelle e presentati con i valori medi e con una misura di variabilità (ad esempio, deviazione standard) e dovranno, se possibile, includere

- (a) velocità del flusso d'aria attraverso l'apparecchiatura di inalazione,
- (b) temperatura e umidità dell'aria,

- (c) concentrazioni nominali (quantitativo totale della sostanza in esame introdotta nel dispositivo per l'inalazione diviso per il volume d'aria);
- (d) natura dell'eventuale veicolo, se usato;
- (e) concentrazioni effettive nella zona di respirazione;
- (f) il diametro aerodinamico mediano in massa (DAMM) e la deviazione standard geometrica (DSG);
- (g) periodo di equilibratura;
- (h) periodo di esposizione;
- tabulazione dei dati di risposta per sesso e per livello di esposizione (cioè il numero di animali morti o sacrificati durante la prova; il numero di animali che presentano sintomi di tossicità; numero di animali esposti);
- momento della morte durante o dopo l'esposizione, ragioni e criteri usati per la eutanasia di animali;
- tutte le osservazioni;
- CL_{50} per ciascun sesso determinata alla fine del periodo di osservazione (specificando il metodo di calcolo);
- intervallo di confidenza statistica del 95 % per la CL_{50} (quando questo possa venire fornito);
- curve dose-mortalità e relativo coefficiente angolare (se il metodo di determinazione lo permette);
- risultati dell'esame necroscopico;
- qualsiasi risultato istopatologico;
- discussione dei risultati (particolare attenzione deve essere dedicata all'effetto che la eutanasia di animali durante la prova può avere sul valore calcolato della CL_{50});
- interpretazione dei risultati.

1.4 PRINCIPIO DEL METODO DI SAGGIO

La sostanza in esame viene applicata a livelli di dose graduati, un livello di dose per gruppo, sulla cute di vari gruppi di animali di saggio. Si procede poi all'osservazione degli effetti e degli eventi letali. Gli animali morti o sacrificati durante il saggio sono sottoposti a necropsopia e i sopravvissuti lo sono a conclusione del saggio.

Può essere necessario sottoporre a eutanasia gli animali che mostrano segni gravi e persistenti di sofferenza e di dolore, non bisogna eseguire la somministrazione di dosi delle sostanze in esame in una maniera che notoriamente provoca dolore e sofferenza marcate a motivo delle proprietà corrosive o gravemente irritanti.

1.5 CRITERI DI QUALITÀ

Nessuno

1.6 DESCRIZIONE DEL METODO ADOTTATO PER IL SAGGIO

1.6.1 Preparazioni

Per almeno cinque giorni prima dell'esperimento, gli animali sono tenuti nelle gabbie usate per il saggio nelle stesse condizioni di stabulazione e di alimentazione dell'esperimento. Prima del saggio, gli animali che dovranno essere giovani adulti e sani, sono scelti con metodo casuale e assegnati ai gruppi sperimentali. Circa 24 ore prima del saggio, si effettua il taglio o la rasatura del pelo nella parte dorsale del corpo della cavia. Durante le operazioni di taglio o rasatura, si deve badare a non ledere la cute dell'animale per evitarne l'abrasione che potrebbe alterarne la permeabilità. Si dovrà preparare almeno il 10 % della superficie corporea per l'applicazione della sostanza in esame. Le sostanze solide, che potranno essere eventualmente ridotte in polvere, dovrebbero essere inumidite con acqua o, se necessario, con un veicolo adatto ad assicurare un buon contatto con la cute. Se viene utilizzato un veicolo, si dovrà tener conto dell'influenza dello stesso sulla penetrazione cutanea della sostanza in esame. Le sostanze liquide generalmente vengono saggiate senza diluizione.

1.6.2 Condizioni del saggio

1.6.2.1 Animali da esperimento

Possono essere utilizzati ratti o conigli adulti. Si possono utilizzare altre specie animali, ma il loro uso dovrebbe essere giustificato. Dovrebbero essere utilizzati ceppi di laboratorio comunemente usati. Per ciascun sesso, all'inizio della prova l'intervallo di variazione del peso degli animali utilizzati non dovrebbe essere superiore a $\pm 20\%$ del valore medio.

1.6.2.2. *Numero e sesso*

Per ciascun saggio vengono usati almeno 5 animali a ciascun livello di dosaggio. Essi dovrebbero essere tutti dello stesso sesso. Se si usano femmine, dovrebbero essere nullipare e non gravide. Nel caso siano disponibili informazioni che dimostrano che un sesso è nettamente più sensibile, si dovrebbero usare animali di questo sesso.

Nota: nei saggi di tossicità acuta con animali di ordine superiore ai roditori, si dovrà prendere in considerazione l'uso di un numero minore di animali. Le dosi devono essere accuratamente scelte e si deve fare ogni sforzo possibile per non superare dosi moderatamente tossiche. In tali prove si dovrebbe evitare la somministrazione di dosi letali della sostanza in esame.

1.6.2.3. *Livelli di dosaggio*

Questi dovranno essere in numero sufficiente, almeno 3, e adeguatamente intervallati per produrre uno spettro di effetti tossici e di tassi di mortalità. Nel decidere i dosaggi occorre tener presente qualsiasi effetto irritante o corrosivo. I dati dovrebbero essere sufficienti per ottenere una curva dose-risposta e, quando possibile, permettere una determinazione accettabile della DL_{50} .

1.6.2.4. *Saggio limite*

Si può eseguire un saggio limite ad un livello di dosaggio di almeno 2 000 mg/kg peso corporeo su un gruppo di 5 animali maschi e 5 femmine usando le procedure sopra descritte. Se si produce una mortalità dovuta al composto, può essere necessario considerare uno studio completo.

1.6.2.5. *Periodo di osservazione*

Il periodo di osservazione dovrebbe essere almeno di 14 giorni. Tuttavia tale durata non è tassativa. Essa dovrebbe dipendere dalla natura delle reazioni tossiche, dalla velocità della loro insorgenza e dalla lunghezza del periodo di guarigione; se necessario, quindi, essa potrà essere prolungata. Il momento in cui compaiono e spariscono i sintomi di tossicità, la loro durata e il momento in cui interviene il decesso, sono importanti soprattutto nel caso in cui la sostanza tenda a causare mortalità ritardata.

1.6.3. *Procedimento*

Ogni gabbia deve contenere un solo animale. La sostanza in esame dovrà essere applicata uniformemente su una superficie pari a circa il 10 % della superficie corporea totale. Per le sostanze altamente tossiche, la superficie può essere inferiore, ma dovrà essere ricoperta da uno strato per quanto possibile sottile e uniforme.

Durante il periodo di esposizione di 24 ore, le sostanze in esame dovranno essere tenute a contatto diretto della cute mediante una garza porosa e un cerotto non irritante. La parte su cui viene applicata la sostanza dovrebbe essere ulteriormente coperta in modo opportuno per tenere ferma la garza e la sostanza in esame e assicurare che gli animali non ingeriscano la sostanza stessa. Dispositivi per la limitazione dei movimenti possono essere usati per impedire agli animali di ingerire la sostanza in esame, ma l'immobilizzazione completa non è consigliabile.

Alla fine del periodo di esposizione si dovrà rimuovere la sostanza residua utilizzando acqua, se possibile, o altri prodotti idonei per la pulizia della pelle.

Le osservazioni dovranno essere registrate sistematicamente non appena fatte, badando a tenere separati i dati per ciascun animale. Durante il primo giorno le osservazioni dovranno essere frequenti. Un attento esame clinico dovrà essere effettuato almeno una volta al giorno per 5 giorni per settimana. Le altre osservazioni dovrebbero essere effettuate quotidianamente, agendo appropriatamente per minimizzare la perdita di animali da studiare, ad esempio necropsia o refrigerazione degli animali trovati morti e isolamento o sacrificio degli animali deboli o moribondi.

Le osservazioni dovrebbero tener conto delle alterazioni riscontrate nel pelo, nella cute trattata, negli occhi e nelle membrane mucose e anche nel sistema respiratorio, circolatorio, nel sistema nervoso autonomo e centrale, nell'attività somatomotoria e nel comportamento dell'animale. Particolare attenzione dovrebbe essere rivolta all'osservazione di tremori, convulsioni, salivazione, diarrea, letargia, sonno e coma. Il momento in cui sopraggiunge il decesso deve essere registrato con la massima precisione possibile. Gli animali che muoiono durante il saggio e quelli che sopravvivono alla fine del saggio sono sottoposti a necropsia. Tutte le variazioni patologiche macroscopiche dovranno essere registrate. Ove del caso, dovrebbero essere prelevati tessuti per l'esame istopatologico.

Valutazione della tossicità nell'altro sesso

Dopo il completamento dello studio su un sesso, si somministra almeno un intervallo di dose ad un gruppo di 5 animali dell'altro sesso per controllare che gli animali di questo sesso non siano nettamente più sensibili alla sostanza in esame. In circostanze particolari può essere giustificato l'uso di un minor numero di animali. Nel caso in cui siano disponibili informazioni adeguate che dimostrano che gli animali del sesso controllato sono nettamente più sensibili, si può fare a meno di effettuare la prova su animali dell'altro sesso.

2

DATI

I risultati dovranno essere riassunti in forma tabellare indicante per ogni singolo gruppo di saggio il numero di animali presenti all'inizio del saggio, il momento del decesso di ciascun animale, il numero di animali che presentano altri segni di tossicità, la descrizione degli effetti tossici e i risultati della necropsia. Il peso di ciascun animale dovrà essere determinato e registrato poco prima dell'applicazione della sostanza, poi settimanalmente e al momento del decesso; le variazioni ponderali dovranno essere calcolate e registrate quando la sopravvivenza sia superiore a un giorno.

Gli animali che vengono sottoposti ad eutanasia in conseguenza di sofferenza e dolore dovuti al composto vengono registrati come morti in conseguenza del composto. La DL_{50} può essere determinata con un metodo riconosciuto.

La valutazione dei dati dovrebbe includere il rapporto, se esistente, tra l'esposizione degli animali alla sostanza in esame e l'incidenza e gravità di tutte le alterazioni, incluse quelle comportamentali e cliniche, le lesioni macroscopiche, le variazioni del peso corporeo, la mortalità e qualsiasi altro effetto tossico.

3

RELAZIONE

3.1

RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- specie, ceppo, origine degli animali, condizioni ambientali, dieta, ecc.,
- condizioni sperimentali (inclusa la tecnica di pulizia della cute e il tipo di medicazione, occlusiva o non occlusiva),
- livelli di dosaggio (col veicolo, se usato, e concentrazione);
- sesso degli animali sottoposti a somministrazione,
- tabulato dei dati di risposta per dose e livello di dosaggio (cioè il numero di animali morti o sacrificati durante la prova, numero di animali che presentano sintomi di tossicità, numero di animali esposti),
- tempo intercorso tra la somministrazione della sostanza e la morte, ragioni e criteri usati per la eutanasia di animali,
- tutte le osservazioni,
- valore della DL_{50} per il sesso sottoposto ad uno studio completo, determinato dopo 14 giorni, specificando il metodo di determinazione;
- intervallo di confidenza statistica del 95 % per la DL_{50} (se può essere fornito),
- curva dose-mortalità e relativo coefficiente angolare (se il metodo di determinazione lo consente),
- risultati necroscopici,
- qualsiasi altro reperto istopatologico,
- risultati di eventuali saggi sull'altro sesso,
- discussione dei risultati (occorre dedicare una particolare attenzione all'effetto che la eutanasia di animali durante la prova può avere sul valore calcolato della DL_{50}),
- interpretazione dei risultati.

Vedi introduzione generale, parte B

1.3. SOSTANZE DI RIFERIMENTO

Nessuna

1.4. PRINCIPIO DEL METODO DI SAGGIO

Considerazioni iniziali

Una attenta considerazione deve essere dedicata a tutte le informazioni disponibili su una sostanza per minimizzare i controlli su sostanze in condizioni che hanno elevate probabilità di produrre gravi reazioni. Nella valutazione se sia pertinente un saggio completo, uno studio su animale singolo o la non esecuzione di ulteriori prove, possono essere utili le seguenti informazioni.

- i) Proprietà chimico-fisiche e reattività chimica. Le sostanze fortemente acide o alcaline (pH dimostrato minore o uguale a 2 o maggiore o uguale a 11,5, per esempio) possono non richiedere il controllo dell'irritazione cutanea primaria se ci si possono attendere proprietà corrosive. Deve essere tenuta presente inoltre la riserva alcalina o acida.
- ii) Se sono disponibili prove convincenti di effetti gravi in prove convalidate *in vitro*, può non essere necessario un saggio completo.
- iii) Risultati di studi di tossicità acuta. Se è stata condotta una prova della tossicità acuta per via cutanea con la sostanza al livello di dosaggio della prova limite (2 000 mg/kg di peso corporeo), e non si è osservata irritazione cutanea, possono essere superflue ulteriori prove. In aggiunta, è superfluo eseguire le prove su materiali che si sono dimostrati fortemente tossici per via cutanea.

La sostanza da saggiare viene applicata in dose unica sulla cute di alcuni animali da esperimento, ognuno dei quali funge come proprio controllo. Dopo un determinato intervallo, si osserva e valuta il grado di irritazione, che viene ulteriormente descritto per fornire una completa valutazione degli effetti. La durata delle osservazioni dovrebbe essere sufficiente per valutare completamente la reversibilità degli effetti osservati.

Può essere necessario sopprimere umanitariamente animali che presentino segni gravi e perduranti di sofferenza e dolore.

1.5. CRITERI DI QUALITÀ

Nessuno.

1.6. DESCRIZIONE DEL METODO DI SAGGIO

1.6.1. Preparazioni

Circa 24 ore prima del saggio, si dovrebbe effettuare il taglio o la rasatura del pelo nella parte dorsale del corpo dell'animale.

Durante le operazioni di taglio o rasatura, si dovrebbe badare a non ledere la cute dell'animale. Si dovrebbero utilizzare soltanto animali con cute sana e intatta.

Alcuni ceppi di coniglio hanno delle isolette di pelo dense che sporgono maggiormente in certi periodi dell'anno. Le sostanze in esame non devono essere applicate a queste zone di crescita densa del pelo.

Le sostanze da saggiare che sono solide (che potranno essere eventualmente ridotte in polvere, se necessario), dovranno essere inumidite con acqua o, se necessario, con un veicolo adatto per assicurare un buon contatto con la cute. Nell'utilizzare un veicolo, si dovrà tener conto dell'influenza dello stesso sull'irritazione cutanea causata dalla sostanza in esame. Di norma, le sostanze liquide sono usate senza diluizione.

1.6.2. Condizioni di saggio

1.6.2.1. Animali da esperimento

Sebbene si possano usare parecchie specie di mammiferi, il coniglio albino è la specie preferibile.

1.6.2.2. Numero di animali

Se dai risultati di saggi di preselezione *in vitro* o sulla base di altre considerazioni si sospetta che la sostanza possa produrre necrosi (cioè essere corrosiva), si dovrebbe prendere in considerazione l'esecuzione della prova su un animale singolo. Se i risultati di questo saggio non indicano corrosività, il saggio deve essere completato utilizzando almeno due animali addizionali.

Per il saggio completo, si utilizzano almeno 3 animali adulti sani. Non sono richiesti animali separati per un gruppo testimone non trattato. Animali addizionali possono essere necessari per chiarire risposte dubbie.

1.6.2.3. Livelli di dosaggio

Salvo controindicazioni, sulla parte prescelta si applicano 0,5 ml di sostanza liquida oppure 0,5 g di sostanza solida o semisolida. Le zone cutanee adiacenti non trattate di ciascun animale servono come controllo per il saggio.

1.6.2.4. Periodo di osservazione

Il periodo di osservazione non va fissato in modo rigido. Esso dovrebbe essere sufficiente per valutare completamente la reversibilità degli effetti osservati, ma normalmente non è necessario superare i 14 giorni dall'applicazione.

1.6.3. Procedimento

Ogni gabbia dovrà contenere un solo animale. La sostanza da saggiare dovrà essere applicata su una piccola area (di circa 6 cm²) della cute e ricoperta da una garza assicurata con un cerotto non irritante. In caso di sostanze liquide o di alcune paste può essere necessario applicare la sostanza sulla garza e successivamente applicare questa sulla cute. Per tutto il periodo di esposizione, la garza deve essere mantenuta blandamente a contatto con la cute mediante un'apposita medicazione occlusiva o semi-occlusiva. Si deve impedire l'accesso dell'animale alla garza e la risultante ingestione/inalazione della sostanza in esame.

Al termine del periodo di esposizione, la sostanza in esame residua deve essere rimossa, se possibile, usando acqua o un solvente appropriato senza alterare la risposta esistente né l'integrità dell'epidermide.

La durata normale dell'esposizione è 4 ore.

Se si sospetta che la sostanza possa produrre necrosi (cioè che sia corrosiva), la durata dell'esposizione dovrebbe essere ridotta (per esempio a 1 ora o 3 minuti). Per tale prova, si può anche impiegare in primo luogo un animale singolo e, salvo che ciò sia impedito dalla tossicità cutanea acuta del composto in esame, si possono applicare simultaneamente tre garze a questo animale. La prima garza viene rimossa dopo 3 minuti. Se non si osservano reazioni cutanee gravi, si rimuove la seconda garza dopo un'ora. Se le osservazioni a questo stadio indicano che è necessaria un'esposizione di 4 ore e che questa esposizione può essere condotta umanamente, la

terza garza viene rimossa dopo 4 ore, e le risposte vengono valutate. In questo caso (cioè quando è stata possibile un'esposizione di 4 ore), la prova dovrebbe poi essere completata usando almeno 2 animali ulteriori, salvo che ciò non sia considerato umano (per esempio se dopo l'esposizione di 4 ore si osserva necrosi).

Se si osserva una grave reazione cutanea (per esempio necrosi) dopo 3 minuti o dopo 1 ora, la prova viene immediatamente interrotta.

In determinate condizioni, per esempio in funzione di previste utilizzazioni ed esposizioni umane, può essere opportuno prolungare l'esposizione.

1.6.3.1 Osservazione e valutazione

Dopo la rimozione della garza, gli animali dovranno essere osservati per cercare eventuali manifestazioni di eritema o edema e i risultati valutati dopo 60 minuti e poi dopo 24, 48 e 72 ore. L'irritazione cutanea viene valutata e registrata secondo il sistema della tabella 1. Ulteriori osservazioni possono essere necessarie se la reversibilità non è completamente accertata entro 72 ore. In aggiunta all'osservazione di irritazioni, devono essere descritti in modo completo eventuali gravi lesioni, come corrosione (distruzione irreversibile di tessuto cutaneo) e altri effetti tossici.

È possibile usare tecniche come l'esame istopatologico o la misura dello spessore delle pieghe cutanee per chiarire reazioni o risposte dubbie mascherate dalla colorazione della pelle da parte della sostanza in esame.

2. DATI

I risultati dovrebbero essere riassunti in forma tabellare indicante per ogni singolo animale il grado di irritazione per l'eritema e l'edema durante tutto il periodo di osservazione. Si dovrebbe provvedere anche alla registrazione di qualsiasi lesione grave, alla descrizione del grado e del tipo di irritazione, della reversibilità o corrosività e di qualsiasi altro effetto tossico osservato.

3. RELAZIONE

3.1. RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- specie, ceppo, origine degli animali usati, condizioni ambientali, dieta, ecc.)
- condizioni sperimentali (incluse le proprietà chimico-fisiche pertinenti della sostanza chimica, la tecnica di preparazione e pulizia della cute e il tipo di medicazione: occlusiva o semi-occlusiva);
- per ciascun animale e per ogni periodo di osservazione il tabulato dei dati delle risposte relative all'irritazione (ad esempio 1, 24, 48 e 72 ore, ecc., dopo l'eliminazione della garza);
- descrizione di qualsiasi lesione grave osservata, inclusa la corrosività;
- descrizione del grado e della natura dell'irritazione osservata e di qualsiasi rilevamento istopatologico;
- descrizione di qualsiasi effetto tossico diverso dall'irritazione cutanea;
- discussione dei risultati;
- interpretazione dei risultati;

1 METODO

1.1 INTRODUZIONE

Vedi introduzione generale, parte B

1.2 DEFINIZIONI

Vedi introduzione generale, parte B

1.3 SOSTANZE DI RIFERIMENTO

Nessuna

1.4 PRINCIPIO DEL METODO DI SAGGIO

Considerazioni iniziali

Attenta considerazione deve essere dedicata a tutte le informazioni disponibili su una sostanza per minimizzare l'esecuzione di prove in condizioni in cui le sostanze hanno elevate probabilità di produrre gravi reazioni. Le seguenti informazioni possono essere utili a questo proposito

- i) Proprietà chimico-fisiche e reattività chimica. Può non essere necessario eseguire la prova con sostanze fortemente acide o alcaline, che per esempio ci si possa aspettare diano nell'occhio un pH di 2 o meno o di 11,5 o più, se ci si possono attendere gravi lesioni. Si deve tenere in considerazione anche la riserva alcalina o acida.

- ii) Risultati di studi alternativi ben convalidati; l'irritazione oculare non dovrebbe essere esaminata ulteriormente in materiali che hanno già dimostrato di avere potenziali proprietà corrosive o gravemente irritanti, in quanto si presume che tali sostanze possano produrre effetti gravi sugli occhi in un saggio che utilizzi il metodo qui descritto.
- iii) Risultati di studi di irritazione cutanea. I materiali che hanno presentato una capacità corrosiva definita o una grave capacità di irritazione cutanea in uno studio di irritazione cutanea non devono essere sottoposti ad ulteriore controllo della capacità irritante oculare, in quanto si presume che tali sostanze possano produrre gravi effetti sugli occhi.

La sostanza da saggiare viene applicata in dose unica su un solo occhio di ognuno di alcuni animali da esperimento; l'occhio non trattato serve da controllo. Il grado di irritazione è valutato secondo una opportuna scala a determinati intervalli e ulteriormente descritto per fornire una completa valutazione degli effetti. La durata delle osservazioni dovrebbe essere sufficiente per valutare completamente la reversibilità o l'irreversibilità degli effetti osservati.

Può essere necessario sopprimere umanitariamente animali che presentano segni gravi e perduranti di sofferenza e dolore.

1.5. CRITERI DI QUALITÀ

Nessuno

1.6. DESCRIZIONE DEL METODO DI SAGGIO

1.6.1. Preparazioni

Durante le 24 ore precedenti l'inizio dell'esperimento, si devono esaminare entrambi gli occhi degli animali provvisoriamente selezionati per il saggio. Gli animali che presentano irritazioni agli occhi, difetti oculari o lesioni preesistenti alla cornea non devono essere utilizzati.

1.6.2. Condizioni per il saggio

1.6.2.1. Animali da esperimento

Sebbene siano stati utilizzati vari animali, si raccomanda di effettuare il saggio con conigli albini adulti e sani.

1.6.2.2. Numero di animali

Se si prevedono effetti marcati, si dovrebbe prendere in considerazione un saggio su animale singolo. Se i risultati di questo saggio su un solo coniglio fanno pensare che la sostanza sia gravemente irritante (effetto reversibile) o corrosiva (effetto irreversibile) nei confronti dell'occhio con l'utilizzo della procedura descritta, può non essere necessario controllare ulteriormente il potere di irritazione oculare in animali successivi. Occasionalmente, saggi ulteriori su animali addizionali possono essere opportuni per studiare aspetti specifici.

Nei casi differenti dal saggio su animale singolo, si devono usare almeno 3 animali. Animali addizionali possono essere necessari per chiarire risposte equivocate.

1.6.2.3. Livelli di dosaggio

Per saggiare le sostanze liquide si impiega una dose di 0,1 ml. Per le sostanze solide, le paste e le sostanze particellate, la quantità utilizzata dovrebbe avere il volume di 0,1 ml o il peso approssimativo di 0,1 g (il peso deve sempre essere registrato). Se la sostanza in esame è solida o granulare, dovrà essere ridotta in polvere fine. Il volume delle particelle dovrebbe essere misurato dopo averle leggermente compattate ad esempio battendo leggermente il contenitore usato per la misurazione.

Per le sostanze contenute in spruzzatori a pompa o contenitori di aerosol pressurizzati, si deve espellere il liquido e raccoglierne 0,1 ml, e instillarli nell'occhio come descritto per i liquidi.

1.6.2.4. Periodo di osservazione

La durata del periodo di osservazione non dovrebbe essere fissata rigidamente. Essa dovrà essere sufficiente per valutare la reversibilità o l'irreversibilità degli effetti osservati, ma normalmente non supererà i 21 giorni dall'instillazione.

1 6 3 Procedimento

Ogni gabbia dovrebbe contenere un solo animale. La sostanza da saggiare dovrebbe essere applicata nella sacca congiuntivale di un occhio di ciascun animale, dopo aver leggermente distaccato la palpebra inferiore dal bulbo oculare. Per evitare la fuoriuscita del materiale, le palpebre devono essere tenute delicatamente chiuse per circa un secondo. L'occhio non trattato serve da controllo.

Se si ritiene che la sostanza possa provocare un dolore non tollerabile si può usare un anestetico locale prima dell'instillazione della sostanza in esame. Il tipo, la concentrazione e il momento di applicazione dell'anestetico locale devono essere scelti accuratamente per assicurare che il suo uso non dia luogo a differenze significative di reazione alla sostanza in esame. L'occhio di controllo deve essere anestetizzato in modo simile.

Per 24 ore dopo l'instillazione della sostanza in esame, gli occhi degli animali non dovrebbero essere lavati. Se appropriato, dopo 24 ore si può effettuare un lavaggio.

Per alcune sostanze che da questo saggio risultano irritanti, può essere opportuno eseguire prove aggiuntive utilizzando dei conigli i cui occhi vengono lavati poco dopo l'instillazione della sostanza. In questi casi si raccomanda di usare 3 conigli. Mezzo minuto dopo l'instillazione, gli occhi dei conigli vengono lavati per mezzo minuto usando un volume e una velocità di flusso tali da non provocare lesioni.

1 6 3 1 Osservazione e valutazione

Gli occhi dovrebbero essere esaminati dopo 1, 24, 48 e 72 ore. Se dopo 72 ore non si notano lesioni oculari, lo studio può essere interrotto.

In caso di complicazioni persistenti alla cornea o di altre irritazioni oculari, può risultare necessario proseguire l'osservazione per determinare l'evoluzione delle lesioni e la loro reversibilità o irreversibilità. Oltre all'esame della cornea, dell'iride e della congiuntiva, si dovrà registrare e includere nella relazione ogni altra eventuale lesione. Per ogni esame si deve registrare il livello di reazione oculare (vedi tabella in appendice). La valutazione delle reazioni oculari è soggetta a varie interpretazioni. Per assistere il laboratorio di saggio e coloro che fanno ed interpretano le osservazioni, può essere usata una guida illustrata dell'irritazione oculare.

L'utilizzazione di una lente binoculare, di una lampada a fessura, di un biomicroscopio o di un altro ausilio idoneo, può facilitare l'esame delle reazioni. Dopo la registrazione delle osservazioni effettuate dopo 24 ore, gli occhi di una parte o di tutti i conigli possono ancora essere esaminati con l'aiuto della fluoresceina.

2 DATI

I risultati dovrebbero essere riassunti in un tabulato indicante per ogni animale la valutazione dell'irritazione ai tempi di osservazione prescritti. Una descrizione del grado e del tipo di irritazione, la presenza di lesioni gravi e qualsiasi effetto rilevato, diverso dagli effetti oculari, dovranno essere riportati.

3 RELAZIONE

3 1 RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- informazioni relative agli animali (specie, ceppo, origine degli animali, condizioni ambientali, dieta ecc.),
- condizioni dell'esperimento (comprese le caratteristiche fisico-chimiche significative della sostanza in esame),
- tabulato degli effetti irritanti/corrosivi per ogni singolo animale ad ogni tempo a cui viene effettuata l'osservazione (ad esempio 1, 24, 48 e 72 ore),
- descrizione di eventuali lesioni gravi osservate,
- descrizione narrativa del grado e della natura dell'irritazione o corrosione osservata, inclusa l'area di cornea interessata e la reversibilità,

- descrizione del metodo adottato per classificare l'irritazione a 1, 24, 48 e 72 ore (ad esempio lampada manuale a fessura, biomicroscopio, fluoresceina);
- descrizione di qualsiasi effetto topico non oculare riscontrato;
- discussione dei risultati;
- interpretazione dei risultati.

3.2. VALUTAZIONE E INTERPRETAZIONE

TABELLA: CLASSIFICAZIONE DELLE LESIONI OCULARI

Cornea

Opacità: grado di densità (per la lettura viene scelta la superficie più densa)

Nessuna ulcerazione o opacità	0
Zone sporadiche o diffuse di opacità (diverse dalla opacità leggera della luminosità normale), particolari dell'iride nettamente visibili	1
Zona traslucida chiaramente visibile, particolari dell'iride leggermente oscurati	2
Zona madreperlacea, nessun dettaglio dell'iride visibile, dimensione della pupilla appena distinguibile ...	3
Cornea opaca, iride non distinguibile attraverso l'opacità	4

Iride

Normale	0
Rughe notevolmente aperte, congestione gonfiore, iperemia circumcorneale modesta, iniezione, l'uno o l'altro di questi effetti o una combinazione di alcuni degli stessi, l'iride reagisce ancora alla luce (una reazione lenta è positiva)	1
Nessuna reazione alla luce, emorragia, lesioni macroscopiche (uno qualsiasi o tutti questi effetti)	2

Congiuntiva

Rossore (della congiuntiva palpebrale e bulbare, della cornea e dell'iride)

Vasi sanguigni normali	0
Alcuni vasi sanguigni decisamente iperemici (congestionati)	1
Colore cremisi diffuso, i singoli vasi sanguigni non sono facilmente distinguibili	2
Rosso bovino diffuso	3

Chemosi: palpebre e/o membrane nittitanti

Nessun gonfiore	0
Qualsiasi gonfiore superiore alla norma (incluse le membrane nittitanti)	1
Gonfiore evidente con parziale ectropion	2
Gonfiore con palpebre socchiuse (circa per la metà)	3
Gonfiore con palpebre quasi chiuse (più della metà)	4

B 6 SENSIBILIZZAZIONE CUTANEA

1 METODO

1.1 Introduzione

Note

La sensibilità dei saggi e la loro efficacia nell'individuazione di potenziali sensibilizzatori della cute umana costituiscono parametri importanti in un sistema di classificazione della tossicità per la tutela della salute pubblica

Non esiste un unico metodo sperimentale atto a identificare correttamente tutte le sostanze dotate di un potenziale sensibilizzante per la cute umana e quindi sistematicamente applicabile

Nella scelta del metodo occorre tener conto di fattori quali le caratteristiche fisiche di una sostanza, compresa la sua capacità di penetrazione cutanea

Sono stati elaborati due tipi di saggio su porcellini d'India: il saggio con utilizzo di adiuvanti, nel quale uno stato allergico viene potenziato sciogliendo o sospendendo la sostanza in esame in adiuvante completo di Freund (ACF), e il saggio senza utilizzo di adiuvante

I saggi con utilizzo di adiuvante offrono generalmente un più elevato grado di precisione nell'individuare un potenziale di sensibilizzazione cutanea nell'uomo rispetto ai metodi che non prevedono l'uso dell'adiuvante completo di Freund. Essi sono pertanto preferibili

Il "Guinea-Pig Maximisation Test" (GPMT) è un test con utilizzo di adiuvante ampiamente usato. Malgrado esistano diversi altri metodi per identificare il potenziale di sensibilizzazione cutanea di una sostanza, il GPMT è considerato il metodo con adiuvante d'elezione

Per molte classi di sostanze chimiche, i saggi senza utilizzo di adiuvante (fra cui il più diffuso è quello di Buehler) sono considerati meno sensibili

In alcuni casi il saggio di Buehler, che prevede un'applicazione topica della sostanza, può risultare preferibile all'iniezione intradermica utilizzata nel Guinea Pig Maximisation Test. Qualora si opti per il saggio di Buehler, si dovrà fornire una giustificazione scientifica

Il Guinea-Pig Maximisation Test (GPMT) e il saggio di Buehler sono descritti nel presente metodo. È possibile il ricorso ad altri metodi, purché siano debitamente convalidati e venga fornita una giustificazione scientifica

In caso di risultato positivo di un saggio di screening riconosciuto, la sostanza in esame può essere considerata un potenziale sensibilizzante e non è necessario condurre un ulteriore test GPMT. Tuttavia in caso di risultato negativo del saggio di screening è necessario condurre un test GPMT attenendosi alla procedura descritta nel presente metodo di saggio

Vedi anche introduzione generale, parte B

1.2 Definizioni

Sensibilizzazione cutanea (dermatite allergica da contatto) è una reazione cutanea a una sostanza mediata da fattori immunologici. Nell'uomo la reazione può essere caratterizzata da prurito, eritema, edema, papule, vescicole, bolle o da una combinazione di queste manifestazioni. In altre specie le reazioni possono differire e limitarsi alla comparsa di eritemi e di edemi

Esposizione di induzione esposizione sperimentale di un soggetto alla sostanza in esame al fine di indurre uno stato di ipersensibilità

Periodo di induzione periodo della durata minima di una settimana, successivo all'esposizione di induzione, entro il quale può manifestarsi uno stato di ipersensibilità

Esposizione di provocazione in un soggetto già trattato, esposizione sperimentale alla sostanza in esame, effettuata successivamente al periodo di induzione al fine di accertare se il soggetto sviluppa una reazione di ipersensibilità

1.3. Sostanze di riferimento

La sensibilità e l'attendibilità della tecnica sperimentale utilizzata devono essere verificate ogni sei mesi utilizzando sostanze notoriamente dotate di proprietà di sensibilizzazione cutanea di grado leggero-medio.

In un saggio eseguito correttamente, per sensibilizzanti di tipo leggero-medio si dovrebbe avere una risposta pari ad almeno il 30 % con il metodo con adiuvanti e ad almeno il 15 % con il metodo senza adiuvanti.

Si farà preferibilmente ricorso alle seguenti sostanze:

Numero CAS	Numero EINECS	Denominazione EINECS	Denominazione corrente
101-86-0	202-983-3	α -esilcinnamaldeide	α -esilcinnamaldeide
149-30-4	205-736-8	benzothiazol-2-tiolo (mercapto-benzothiazolo)	kaptax
94-09-7	202-303-5	benzocaina	norcaina

Qualora le circostanze lo giustificino, potranno essere utilizzate altre sostanze di controllo conformi ai criteri suelencati.

1.4. Principio del metodo di saggio

In un primo tempo gli animali vengono esposti alla sostanza da saggiare con iniezioni intradermiche e/o applicazione epidermica (esposizione di induzione). Dopo un periodo di riposo di 10-14 giorni (periodo di induzione), in cui si può sviluppare una risposta immunitaria, essi vengono esposti alla dose di provocazione. L'estensione e la gravità della reazione cutanea all'esposizione di provocazione vengono confrontate con la reazione sviluppata dagli animali di controllo trattati con un placebo nella fase di induzione e sottoposti all'esposizione di provocazione.

1.5. Descrizione dei metodi di saggio

Se lo si ritiene necessario, si procederà alla rimozione della sostanza da saggiare utilizzando acqua o un solvente appropriato, in modo da non alterare la reazione in corso, né intaccare l'integrità dell'epidermide.

1.5.1. *Guinea-Pig Maximisation Test (GMPT)*

1.5.1.1. Preparazioni

Porcellini d'India albini, giovani e sani, vengono acclimatati alle condizioni di laboratorio per almeno 5 giorni prima dell'inizio del saggio. Prima dell'esperimento, gli animali vengono suddivisi in modo casuale ed assegnati al gruppo da trattare o al gruppo di controllo. In funzione del metodo di saggio utilizzato, il pelo verrà tagliato, rasato o rimosso con una sostanza depilatoria, avendo cura di non danneggiare la cute. Gli animali vengono pesati all'inizio e alla fine del saggio.

1.5.1.2. Condizioni sperimentali

1.5.1.2.1. Animali da esperimento

Si utilizzano porcellini d'India albini di ceppi comunemente usati in laboratorio.

1.5.1.2.2. Numero e sesso

Si utilizzano animali di sesso maschile e/o femminile. Le femmine dovranno essere nullipare e non gravide.

Il gruppo sottoposto a trattamento deve essere composto da almeno 10 animali, il gruppo di controllo da un minimo di 5. Qualora il primo gruppo comprenda meno di 20 esemplari ed il secondo meno di 10 e non sia possibile concludere che la sostanza in esame è un sensibilizzante, si consiglia di proseguire lo studio fino a disporre di almeno 20 animali trattati e 10 di controllo.

1 5 1 2 3 Livelli di dosaggio

La concentrazione della sostanza in esame utilizzata per ogni esposizione di induzione deve essere ben tollerata a livello sistemico e corrispondere alla dose massima suscettibile di produrre un'irritazione cutanea di grado leggero-medio. La concentrazione utilizzata per l'esposizione di provocazione deve corrispondere alla dose massima che non cagioni irritazione. Se necessario, la concentrazione appropriata può essere determinata con uno studio pilota condotto su due o tre animali. A questo scopo è preferibile utilizzare animali trattati con l'adiuvante completo di Freund.

1 5 1 3 Procedimento

1 5 1 3 1 Induzione

Giorno 0 — gruppo trattato

Nella regione della spalla, debitamente depilata, si praticano tre serie di due iniezioni intradermiche da 0,1 ml ciascuna. Le due iniezioni di ciascuna serie devono essere praticate l'una a sinistra e l'altra a destra della linea mediana.

Iniezione 1: miscela 1:1 (v/v) ACF/acqua o soluzione salina fisiologica.

Iniezione 2: la sostanza in esame in un veicolo adatto alla concentrazione selezionata.

Iniezione 3: la sostanza in esame alla concentrazione desiderata, formulata in una miscela 1:1 (v/v) ACF/acqua o soluzione salina fisiologica.

Nell'iniezione 3, le sostanze idrosolubili vengono disciolte nella fase acquosa prima di essere miscelate con l'ACF. Le sostanze liposolubili o insolubili vengono messe in sospensione nell'ACF prima di essere combinate con la fase acquosa. La concentrazione finale della sostanza in esame deve essere uguale a quella utilizzata nell'iniezione 2.

Le iniezioni 1 e 2 vengono praticate l'una accanto all'altra e quanto più possibile in prossimità della testa, mentre la 3 è praticata verso la parte caudale della zona d'esame.

Giorno 0 — gruppo di controllo

Tre serie di due iniezioni intradermiche, ciascuna del volume di 0,1 ml, sono praticate negli stessi punti scelti per gli animali trattati.

Iniezione 1: miscela 1:1 (v/v) ACF/acqua o soluzione salina fisiologica.

Iniezione 2: il veicolo non diluito.

Iniezione 3: formulazione 50 % p/v del veicolo in una miscela 1:1 (v/v) ACF/acqua o soluzione salina fisiologica.

Giorno 5-7 — gruppo trattato e gruppo di controllo

Circa 24 ore prima dell'applicazione topica di induzione, se la sostanza non è un irritante cutaneo l'area di prova, debitamente tosata e/o rasata, viene trattata con 0,5 ml di laurilsolfato di sodio al 10 % in vaselina, al fine di provocare un'irritazione locale.

Giorno 6-8 — gruppo trattato

L'area di prova viene nuovamente depilata. Una carta da filtro (2×4 cm), impregnata della sostanza in esame incorporata in un veicolo adatto, viene applicata sull'area di prova e tenuta in contatto con la cute per 48 ore mediante una medicazione occlusiva. La scelta del veicolo deve essere motivata. Le sostanze solide vengono ridotte in polvere e incorporate in un veicolo adatto. I liquidi, se del caso, possono essere applicati direttamente.

Giorno 6-8 — gruppo di controllo

L'area di prova viene nuovamente depilata. Il solo veicolo viene applicato con le stesse modalità sull'area di prova e tenuto a contatto per 48 ore mediante una medicazione occlusiva.

1 5 1 3 2 Provocazione (challenge)

Giorno 20-22 — gruppo trattato e gruppo di controllo

Si rimuove il pelo dai fianchi degli animali trattati e degli animali di controllo. Su un fianco si applica una garza o una compressa impregnata della sostanza in esame e, se opportuno, sull'altro si applica una garza o una compressa impregnata del solo veicolo. Le compresse vengono tenute a contatto con la cute per 24 ore mediante una medicazione occlusiva.

1.5.1.3.3. Osservazione e valutazione: gruppo trattato e gruppo di controllo

- circa 21 ore dopo la rimozione della compressa, la zona sottoposta a "challenge" viene pulita e tosata e/o rasata e depilata, se necessario;
- circa 3 ore più tardi (approssimativamente 48 ore dall'inizio dell'applicazione di provocazione) la reazione cutanea viene esaminata e classificata in base alla scala di valutazione riportata in appendice;
- circa 24 ore dopo detto esame si procede a una seconda osservazione (72 ore) e a una nuova classificazione delle reazioni cutanee.

È consigliabile procedere ad una lettura cieca nei due gruppi di animali.

Qualora sia necessario chiarire i risultati ottenuti nel primo "challenge", una seconda esposizione di provocazione, ove del caso con un nuovo gruppo di controllo, potrà essere effettuata a circa una settimana di distanza dalla prima. Il nuovo "challenge" potrà essere realizzato anche sul gruppo di controllo iniziale.

Tutte le reazioni cutanee e qualsiasi risultato insolito, comprese le reazioni sistemiche, derivanti dall'esposizione di induzione e di provocazione, dovranno essere osservate e classificate in base alla scala di valutazione di Magnusson/Kligman (vedi appendice). Per chiarire eventuali reazioni dubbie si potrà far ricorso ad altre tecniche, quali l'esame istopatologico o la misurazione dello spessore delle pieghe cutanee.

1.5.2. Saggio di Buehler

1.5.2.1. Preparazioni

Porcellini d'India albin, giovani e sani, vengono acclimatati alle condizioni di laboratorio per almeno 5 giorni prima dell'inizio del saggio. Prima dell'esperimento, gli animali vengono suddivisi in modo casuale ed assegnati al gruppo da trattare o al gruppo di controllo. In funzione del metodo di saggio utilizzato, il pelo verrà tagliato, rasato o rimosso con una sostanza depilatoria, avendo cura di non danneggiare la cute. Gli animali vengono pesati all'inizio e alla fine del saggio.

1.5.2.2. Condizioni sperimentali

1.5.2.2.1. Animali da esperimento

Si utilizzano porcellini d'India albin di ceppi comunemente usati in laboratorio.

1.5.2.2.2. Numero e sesso

Si utilizzano animali di sesso maschile e/o femminile. Le femmine dovranno essere nullipare e non gravide.

Il gruppo sottoposto a trattamento deve essere composto da almeno 20 animali, il gruppo di controllo da un minimo di 10.

1.5.2.2.3. Livelli di dosaggio

La concentrazione della sostanza in esame utilizzata per ogni esposizione di induzione deve corrispondere alla dose massima suscettibile di produrre un'irritazione cutanea moderata e non eccessiva. La concentrazione utilizzata per l'esposizione di provocazione deve corrispondere alla dose massima che non cagioni irritazione. Se necessario, la concentrazione appropriata può essere determinata con uno studio pilota condotto su due o tre animali.

Nel caso di sostanze idrosolubili, l'acqua o una soluzione diluita non irritante di surfactante rappresentano il veicolo più appropriato. Per le altre sostanze si preferiranno una miscela di etanolo all'80 % ed acqua per la fase di induzione e dell'acetone per la fase di provocazione.

1.5.2.3. Procedimento

1.5.2.3.1. Induzione

Giorno 0 — gruppo trattato

Gli animali vengono tosati su un fianco. La compressa utilizzata per il saggio viene impregnata della sostanza in esame incorporata in un veicolo idoneo (la scelta del veicolo deve essere motivata; se del caso, le sostanze liquide possono essere applicate non diluite). La compressa viene applicata sull'area di prova e tenuta a contatto con la pelle per sei ore mediante un cerotto occlusivo e una fasciatura adeguata.

La medicazione deve essere occlusiva. Si potrà ricorrere a un tampone d'ovatta, rotondo o quadrato e di circa 4-6 cm². Per garantire l'occlusione, è opportuno limitare la libertà di movimento degli animali con un sistema adeguato. Se si utilizza una fasciatura, possono essere necessarie esposizioni supplementari.

Giorno 0 — gruppo di controllo

Gli animali vengono tosati su un fianco. Il solo veicolo viene applicato con modalità analoghe a quelle utilizzate per il gruppo trattato. La compressa viene tenuta a contatto con la pelle per sei ore mediante un cerotto occlusivo e una fasciatura adeguata. Se si dimostra che non è necessario disporre di un gruppo di controllo cui sia stato somministrato un placebo, si potrà utilizzare un gruppo di controllo non sottoposto a tale trattamento.

Giorni 6-8 e 13-15 — gruppo trattato e gruppo di controllo

Si esegue la stessa applicazione del giorno 0 sulla medesima area di prova (rasata, se necessario) sulla stesso fianco il giorno 6-8 e nuovamente il giorno 13-15.

1.5.2.3.2. Provocazione (challenge)

Giorno 27-29 — gruppo trattato e gruppo di controllo

Il fianco non trattato degli animali trattati e degli animali di controllo viene tosato. Si procede quindi all'applicazione di un cerotto occlusivo o di una compressa contenente un'adeguata quantità della sostanza in esame, alla massima concentrazione non irritante, sulla parte posteriore del fianco non trattato in entrambi i gruppi di animali.

Se necessario, si applica inoltre un cerotto occlusivo o una compressa contenente il solo veicolo sulla parte anteriore del fianco non trattato di entrambi i gruppi di animali. Il cerotto o la compressa vengono tenuti a contatto con la pelle per 6 ore mediante un'adeguata medicazione.

1.5.2.3.3. Osservazione e valutazione

- Circa 21 ore dopo la rimozione del cerotto, la zona sottoposta a "challenge" viene depilata,
- circa tre ore più tardi (approssimativamente 30 ore dopo l'applicazione di provocazione) le reazioni cutanee vengono esaminate e classificate in base alla scala di valutazione riportata in appendice,
- circa 24 ore dopo detto esame (approssimativamente 54 ore dopo l'applicazione di provocazione) si procede a una seconda osservazione e a una nuova classificazione delle reazioni cutanee.

È consigliabile procedere ad una lettura cieca nei due gruppi di animali.

Qualora sia necessario chiarire ulteriormente i risultati ottenuti nel primo "challenge", una seconda esposizione di provocazione, ove del caso con un nuovo gruppo di controllo, potrà essere effettuata a circa una settimana di distanza dalla prima. Il nuovo "challenge" potrà essere realizzato anche sul gruppo di controllo iniziale.

Tutte le reazioni cutanee e qualsiasi risultato insolito, comprese le reazioni sistemiche, derivanti dall'esposizione di induzione e di provocazione, dovranno essere osservate e classificate in base alla scala di valutazione di Magnusson/Kligman (vedi appendice). Per chiarire eventuali reazioni dubbie si potrà far ricorso ad altre tecniche, quali l'esame istopatologico o la misurazione dello spessore delle pieghe cutanee.

2. DATI (GPMT E SAGGIO DI BUEHLER)

I dati saranno riassunti in forma tabulare, indicando, per ogni animale, le reazioni cutanee rilevate nel corso di ogni osservazione.

3. RELAZIONE (GPMT E SAGGIO DI BUEHLER)

Se il saggio sul porcellino d'India è preceduto da una prova preliminare, si avrà cura di fornirne la descrizione o il riferimento (p. es. Local Lymph Node Assay (LLNA), Mouse Ear Swelling Test (MEST), compreso il procedimento particolareggiato, insieme ai risultati ottenuti con le sostanze da saggiare e le sostanze di riferimento.

Relazione sul saggio (GPMT E SAGGIO DI BUEHLER)

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

Animali da esperimento

- ceppo di porcellino d'India utilizzato;
- numero, età e sesso degli animali;
- origine, condizioni di alloggiamento, dieta, ecc.,
- peso di ogni singola cavia all'inizio dell'esperimento.

Condizioni sperimentali:

- tecnica di preparazione dell'area di applicazione della compressa;
- materiali utilizzati e tecnica di preparazione e di applicazione della compressa;
- risultato dello studio pilota e conclusioni relative alle concentrazioni di induzione e di provocazione da utilizzare nel saggio;
- modalità di preparazione, applicazione e rimozione della sostanza in esame;
- motivazione della scelta del veicolo;
- concentrazioni del veicolo e della sostanza utilizzate per le esposizioni di induzione e di provocazione, nonché quantità totale di sostanza applicata per l'induzione e la provocazione.

Risultati:

- un riepilogo dei risultati dell'ultimo controllo di sensibilità e attendibilità (vedi 1.3), comprese le informazioni sulla sostanza, la concentrazione e il veicolo utilizzato;
- tutte le osservazioni effettuate su ogni singolo animale, compreso il sistema di classificazione;
- la descrizione della natura e dell'entità degli effetti osservati;
- tutti i reperti dell'esame istopatologico.

*Discussione dei risultati.**Conclusioni.***4. RIFERIMENTI**

Il presente metodo corrisponde al metodo OCSE TG 406.

Appendice

TABELLA

scala di Magnusson/Kligman per la classificazione delle reazioni al saggio di provocazione cutanea

0 = assenza di modificazioni visibili

1 = entema localizzato o a distribuzione irregolare

2 = entema modesto e confluyente

3 = entema intenso associato a tumefazione

•B.7 TOSSICITÀ A DOSE RIPETUTA (28 GIORNI) PER VIA ORALE**1. METODO****1.1. Introduzione**

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Principio del metodo di saggio

La sostanza in esame viene somministrata in dosi giornaliere graduate ad alcuni gruppi di animali da esperimento, un livello di dose per gruppo, per un periodo di 28 giorni. Durante il periodo di somministrazione gli animali vengono giornalmente esaminati al fine di rilevare eventuali segni di tossicità. Gli animali deceduti o soppressi durante l'esperimento vengono sottoposti a necropsopia. Al termine del saggio gli animali superstiti vengono soppressi e sottoposti a necropsopia.

Il presente metodo attribuisce particolare importanza agli effetti neurologici in quanto parametro specifico di valutazione e comporta la necessità di un'accurata osservazione clinica degli animali per ottenere il maggior numero possibile di informazioni. Tale metodo è finalizzato all'individuazione di sostanze chimiche dotate di un potenziale neurotossico, che potranno successivamente richiedere indagini più approfondite al riguardo. Esso può inoltre fornire indicazioni sugli effetti immunologici e sulla tossicità per l'apparato riproduttivo.

1.4. Descrizione del metodo di saggio**1.4.1. Preparazioni**

Animali adulti, giovani e sani, vengono suddivisi in modo casuale e assegnati a gruppi da trattare e a gruppi di controllo. Le gabbie dovranno essere sistemate in modo da ridurre al minimo eventuali effetti dovuti alla loro collocazione. Gli animali vengono identificati individualmente e tenuti nelle loro gabbie per un periodo di almeno 5 giorni prima dell'inizio del saggio, in modo da potersi acclimatare alle condizioni di laboratorio.

La sostanza in esame viene somministrata a mezzo di sonda gastrica, con gli alimenti e con l'acqua. La modalità di somministrazione orale viene scelta in funzione della finalità dello studio e delle proprietà fisico-chimiche della sostanza.

Se necessario, la sostanza in esame viene disciolta o messa in sospensione in un veicolo adeguato. Ove possibile, si preferirà una soluzione/sospensione acquosa, o, come seconda alternativa, una soluzione/emulsione in olio (per esempio olio di mais), o ancora, infine, una soluzione in altri veicoli. Per i veicoli non acquosi, dovranno esserne note le caratteristiche di tossicità. È opportuno determinare la stabilità della sostanza in esame nel veicolo.

1.4.2. Condizioni sperimentali**1.4.2.1. Animali da esperimento**

Il ratto è la specie d'elezione, ma sono ammesse anche altre specie di roditori. Si utilizzeranno animali adulti, giovani e sani, di ceppi comunemente usati in laboratorio. Le femmine dovranno essere nullipare e non gravide. La somministrazione dovrà prima possibile al termine dello svezzamento, e comunque non oltre la nona settimana di vita.

All'inizio dello studio, la variazione di peso degli animali dovrà essere minima e non essere superiore al ± 20 per cento del peso medio per ogni sesso.

Qualora, prima di uno studio a lungo termine, si effettui uno studio preliminare con somministrazione orale ripetuta, si utilizzeranno di preferenza in entrambi animali provenienti dallo stesso ceppo e aventi la medesima origine.

1.4.2.2. Numero e sesso

Per ciascun livello di dosaggio dovranno essere utilizzati almeno 10 animali (cinque femmine e 5 maschi). Se il protocollo sperimentale prevede la soppressione di animali nel corso dello studio, il numero totale dovrà essere aumentato in ragione del numero di animali che si prevede di sacrificare.

Inoltre, un gruppo satellite di 10 animali (cinque per sesso) potrà essere trattato alla dose massima per 28 giorni e tenuto in osservazione nei 14 giorni successivi al fine di valutare la reversibilità, la persistenza o la comparsa tardiva di effetti tossici. È altresì previsto l'utilizzo di un gruppo satellite di 10 animali di controllo (cinque animali per sesso).

1.4.2.3 Livelli di dosaggio

Si utilizzano generalmente almeno tre gruppi da trattare e un gruppo di controllo. Quest'ultimo, fatta eccezione per la somministrazione della sostanza in esame, dovrà essere trattato in modo identico ai gruppi sottoposti a trattamento. Qualora la sostanza da saggiare venga incorporata in un veicolo, al gruppo di controllo verrà somministrato il medesimo veicolo nel volume massimo utilizzato.

Se, in base alla valutazione di altri dati, sussistono motivi per ritenere che un dosaggio di 1 000 mg/kg pc/d non dovrebbe produrre effetti, è possibile eseguire un saggio limite. In mancanza di dati al riguardo, potrà essere effettuato uno studio finalizzato alla determinazione di un range entro il quale selezionare le dosi da somministrare.

I livelli di dosaggio dovranno essere selezionati tenendo conto di tutti i dati esistenti sulla tossicità e le caratteristiche (tossico-)cinetiche della sostanza da saggiare o di sostanze affini. Il livello massimo di dosaggio dovrà essere tale da indurre effetti tossici senza tuttavia cagionare la morte o sofferenze gravi. Sarà inoltre definita una serie decrescente di dosaggi al fine di individuare eventuali risposte a dosi determinate e dimostrare l'assenza di effetti avversi al dosaggio minimo (NOAEL, no-observed-adverse effects). Per la determinazione dei livelli decrescenti di dosaggio risulta spesso ottimale applicare un fattore di divisione compreso tra due e quattro, è comunque preferibile aggiungere un quarto gruppo di studio piuttosto che avere uno scarto eccessivo (superiore ad un fattore 10) tra una dose e l'altra.

Se la sostanza è somministrata con gli alimenti o con l'acqua, è importante verificare che le quantità di sostanza necessarie non alterino il bilancio idrico o nutrizionale. Se la sostanza in esame è somministrata con la dieta, si può utilizzare sia una concentrazione dietetica (ppm), sia un livello di dosaggio costante in funzione del peso degli animali, avendo cura di specificare quale sia l'alternativa prescelta. Se la sostanza è somministrata tramite sonda gastrica, la dose deve essere somministrata ogni giorno alla stessa ora e modificata in modo da mantenere un dosaggio costante in funzione del peso dell'animale.

Qualora, prima di uno studio a lungo termine, si effettui uno studio preliminare con somministrazione orale ripetuta, la dieta degli animali dovrà essere identica in entrambi.

1.4.2.4 Saggio limite

Qualora un saggio, effettuato in conformità con il metodo descritto, con un livello di dosaggio di almeno 1 000 mg/kg di peso corporeo/giorno o, in caso di somministrazione con gli alimenti o l'acqua, ad una concentrazione equivalente (in funzione del peso corporeo), non produca effetti tossici evidenti e se i dati relativi a sostanze di struttura affine non sono suggestivi di tossicità, può non essere necessario eseguire uno studio completo utilizzando tre dosaggi. Il saggio limite è giustificato, salvo nel caso in cui l'esposizione umana comporti la necessità di utilizzare un più elevato livello di dosaggio.

1.4.2.5 Periodo di osservazione

Il periodo di osservazione ha una durata di 28 giorni. Gli animali del gruppo satellite selezionati per effettuare ulteriori osservazioni dovranno essere esaminati per almeno altri 14 giorni senza alcun trattamento al fine di individuare l'insorgenza, la persistenza o la scomparsa tardiva degli effetti tossici.

1.4.3 Procedimento

La sostanza in esame viene somministrata agli animali giornalmente, sette giorni su sette, per un periodo di 28 giorni. La scelta di somministrare la sostanza cinque giorni alla settimana deve essere opportunamente motivata. Se effettuata mediante intubazione, la somministrazione avverrà in una singola dose mediante sonda gastrica o apposita cannula. Il volume massimo di liquido somministrabile in una sola volta dipende dalla taglia dell'animale. Esso non dovrebbe superare 1 ml/100 g di peso corporeo, eccetto nel caso di soluzioni acquose, dove sono ammessi 2 ml/100 g di peso corporeo. Salvo nel caso di sostanze irritanti o corrosive suscettibili di produrre effetti esacerbati a concentrazioni più elevate, la variabilità del volume di saggio dovrà essere ridotta al minimo ritoccando la concentrazione, in modo da mantenere un volume costante per qualsiasi livello di dosaggio.

1.4.3.1 Osservazioni generali

Osservazioni cliniche generali devono essere effettuate almeno una volta al giorno, preferibilmente alla stessa ora e tenendo conto del periodo probabile di massima intensità degli effetti dopo la somministrazione. Si registreranno informazioni concernenti le condizioni di salute degli animali. Almeno due volte al giorno, tutti gli animali vengono esaminati al fine di determinare la morbidità e la mortalità. Gli animali moribondi o recanti segni di grave sofferenza o dolore saranno immediatamente esclusi dallo studio, sottoposti ad eutanasia e a necropsia.

Prima dell'esposizione iniziale (per consentire un confronto sullo stesso soggetto) e almeno una volta alla settimana successivamente tutti gli animali vengono sottoposti ad osservazioni cliniche particolareggiate. A tale scopo gli animali vengono tolti dalle gabbie, collocati in un recinto standard ed esaminati di preferenza sempre alla stessa ora. Le osservazioni vengono accuratamente registrate, possibilmente utilizzando sistemi di punteggio esplicitamente definiti dal laboratorio che esegue il saggio. Si avrà cura di ridurre al minimo le variazioni delle condizioni sperimentali e le osservazioni saranno condotte di preferenza da persone che non siano al corrente del trattamento. Si terrà conto, tra l'altro, di tutte le alterazioni della cute, del pelo, degli occhi, delle membrane mucose, della comparsa di secrezioni ed escrezioni e dell'attività del sistema nervoso autonomo (p. es. lacrimazione, piloerezione, ampiezza pupillare, ritmo respiratorio insolito). Verranno inoltre registrate le modifiche osservate nel comportamento, nella postura e nella risposta alla manipolazione, come pure la presenza di movimenti clonici o tonici, stereotipi (p. es. tolettatura eccessiva, continuo girare in tondo) o comportamenti insoliti (p. es. automutilazione, marcia a ritroso).

Nella quarta settimana di esposizione si procede alla valutazione della reattività sensoriale a diversi tipi di stimolo (p. es. uditivi, visivi e propriocettivi), della forza di prensione e dell'attività motoria. Ulteriori dettagli sui metodi utilizzabili sono riportati in letteratura (vedi introduzione generale parte B).

Le osservazioni funzionali previste per la quarta settimana di esposizione possono essere evitate nel caso di uno studio preliminare ad un successivo studio subcronico (90 giorni). In questa eventualità, le osservazioni funzionali saranno incluse nello studio complementare. D'altro canto le informazioni ricavate possono essere utili nella determinazione dei livelli di dosaggio per un successivo studio subcronico.

In via eccezionale, le osservazioni funzionali potranno essere evitate anche per i gruppi che presentino segni di tossicità suscettibili di interferire in modo significativo con i risultati delle prove funzionali.

1.4.3.2. Peso corporeo e consumo di cibo e di acqua

Tutti gli animali devono essere pesati almeno una volta alla settimana. Il consumo di cibo e di acqua viene determinato con scadenza almeno settimanale. Se la sostanza in esame viene somministrata con l'acqua, anche il consumo di acqua deve essere misurato almeno una volta alla settimana.

1.4.3.3. Ematologia

Al termine del periodo di prova si effettueranno i seguenti controlli ematologici: ematocrito, concentrazione dell'emoglobina, conteggio degli eritrociti, conteggio dei leucociti totali e formula leucocitaria, conteggio delle piastrine e determinazione del tempo/potenziale di coagulazione.

I campioni di sangue devono essere prelevati in un sito determinato immediatamente prima o durante la soppressione degli animali e conservati in condizioni adeguate.

1.4.3.4. Biochimica clinica

Esami biochimico clinici finalizzati allo studio dei principali effetti tossici sui tessuti ed in particolare sui reni e sul fegato dovranno essere effettuati sui campioni di sangue prelevati da tutti gli animali immediatamente prima o durante la loro soppressione (eccetto gli animali trovati morti e/o soppressi nel corso del saggio). È preferibile che gli animali vengano tenuti a digiuno dalla sera precedente il prelievo di sangue⁽¹⁾. Le analisi sul plasma o sul siero comprenderanno il sodio, il potassio, il glucosio, il colesterolo totale, l'urea, la creatinina, le proteine totali e l'albmina, almeno due enzimi indicatori degli effetti epatocellulari (come l'alanina aminotransferasi, l'aspartato aminotransferasi, la fosfatasi alcalina, la gamma glutamil transpeptidasi e la sorbitolo deidrogenasi). Determinazioni di altri enzimi (di origine epatica o altro) e degli acidi biliari possono talvolta fornire indicazioni utili.

⁽¹⁾ Per un certo numero di analisi nel siero e nel plasma, ed in particolare per la determinazione del glucosio, è preferibile che gli animali siano a digiuno dalla sera precedente. In caso contrario infatti si ha una maggiore variabilità nei risultati, cosa che può dissimulare gli effetti meno evidenti e ostacolare l'interpretazione. D'altro canto, però, il digiuno può modificare il metabolismo generale degli animali e, soprattutto negli studi sull'alimentazione, perturbare l'esposizione giornaliera alla sostanza in esame. Se si opta per il digiuno, gli esami biochimico clinici dovranno essere effettuati dopo le osservazioni funzionali della quarta settimana.

I seguenti esami delle urine possono essere facoltativamente effettuati nell'ultima settimana dello studio utilizzando un volume d'urina raccolto ad orari fissi: aspetto, volume, osmolalità o densità relativa, pH, albumina, glucosio e sangue-eritrociti.

Sono inoltre raccomandati studi sui marker serici delle lesioni tissutali generali. Altre determinazioni dovranno essere eseguite qualora si abbia motivo di ritenere o di sospettare che le proprietà della sostanza in esame possano alterare i profili metabolici riguardanti il calcio, il fosfato, i trigliceridi a digiuno, gli ormoni specifici, la metemoglobina e la colinesterasi. Tali parametri dovranno essere determinati per certe classi di sostanze o determinati composti specifici.

Nel complesso è opportuno adottare un approccio flessibile, che tenga conto della specie utilizzata e degli effetti osservati e/o previsti della sostanza in esame.

Se i dati storici di base risultano inadeguati, è opportuno determinare i parametri ematologici e biochimico-chimici prima dell'inizio del saggio.

1.4.3.5 Necropsia macroscopica

Tutti gli animali dello studio dovranno essere sottoposti ad una necropsia completa, comprendente un accurato esame della superficie esterna del corpo, di tutti gli orifizi, della cavità cranica, toracica e addominale e del loro contenuto. Il fegato, i reni, le ghiandole surrenali, i testicoli, gli epididimi, il timo, la milza, il cervello e il cuore di tutti gli animali saranno opportunamente sezionati e pesati quanto più rapidamente possibile onde evitarne la disidratazione.

I seguenti tessuti dovranno essere conservati nel mezzo di fissazione, più adeguato in funzione del tipo di tessuto e degli esami istopatologici previsti: tutti i tessuti recanti lesioni macroscopiche, encefalo (le regioni rappresentative comprendono cervello, cervelletto e ponte), midollo spinale, stomaco, intestino tenue e crasso (comprese le placche di Peyer), fegato, reni, ghiandole surrenali, milza, cuore, timo, tiroide, trachea e polmoni (conservati con insufflazione di un fissativo e successiva immersione), gonadi, organi genitali accessori (p. es. utero, prostata), vescica, linfonodi (preferibilmente un linfonodo sulla via di somministrazione e un linfonodo distante da essa, in modo da coprire gli effetti sistemici), nervi periferici (nervo sciatico o nervo tibiale), possibilmente in stretta prossimità del muscolo, e una sezione del midollo osseo (o, in alternativa, un preparato fresco di midollo osseo aspirato). In base all'esito dell'esame clinico e ad altri risultati può risultare opportuno esaminare altri tessuti. Dovranno inoltre essere conservati tutti gli organi ritenuti organi bersaglio potenziali in funzione delle proprietà note della sostanza in esame.

1.4.3.6 Esame istopatologico

Un esame istopatologico completo sarà effettuato sugli organi e i tessuti conservati di tutti gli animali del gruppo di controllo e del gruppo trattato con dosaggio elevato. Detto esame sarà esteso agli animali degli altri gruppi di dosaggio qualora nel gruppo a dosaggio elevato vengano osservate alterazioni indotte dalla sostanza.

Si procederà all'esame di tutte le lesioni macroscopiche.

Nel caso si utilizzi un gruppo satellite, un esame istopatologico dovrà essere eseguito sui tessuti e gli organi per i quali siano stati osservati effetti nei gruppi trattati.

2 DATI

Dovranno essere forniti i dati individuali di ciascun animale. Inoltre, tutti i dati dovranno essere riassunti in una tabella indicante, per ogni gruppo, il numero di animali all'inizio del saggio, il numero di animali rinvenuti morti durante il saggio o sottoposti ad eutanasia nonché il momento del decesso o della soppressione di ciascun animale, il numero di animali recanti segni di tossicità, una descrizione degli effetti tossici con indicazione del momento della comparsa, della durata e della gravità di detti effetti, il numero di animali che presentano lesioni, il tipo di lesione e la percentuale di animali per ogni tipo di lesione.

Se possibile, i risultati numerici devono essere valutati sulla base di un metodo statistico adeguato e generalmente riconosciuto. I metodi statistici devono essere selezionati durante la fase di progettazione dello studio.

RELAZIONE**Relazione sul saggio**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

Animali da esperimento:

- specie/ceppo utilizzati;
- numero, età e sesso degli animali;
- origine, condizioni di alloggiamento, dieta ecc.;
- peso di ciascun animale determinato all'inizio del saggio, con cadenza settimanale nel periodo successivo e al termine del saggio.

Condizioni sperimentali:

- motivazione della scelta del veicolo utilizzato, se diverso dall'acqua;
- motivazione della scelta del livello di dosaggio;
- informazioni dettagliate sulla formulazione della sostanza e sulla preparazione della dieta, concentrazione ottenuta, stabilità e omogeneità della preparazione;
- modalità precise di somministrazione della sostanza in esame;
- se del caso, conversione della concentrazione della sostanza somministrata con gli alimenti o con l'acqua (ppm) in dose effettiva (mg/kg di peso corporeo/giorno);
- informazioni dettagliate sulla qualità del cibo e dell'acqua.

Risultati:

- peso corporeo/modificazioni del peso corporeo;
- consumo di cibo e, se del caso, consumo di acqua;
- dati concernenti la risposta tossica per sesso e per dose, compresi i segni di tossicità;
- natura, gravità e durata degli effetti clinici osservati (ed eventuale reversibilità);
- valutazione dell'attività sensoriale, della forza di prensione e dell'attività motoria;
- esami ematologici e relativi valori di riferimento;
- esami biochimico-clinici e relativi valori di riferimento;
- peso corporeo al momento della soppressione degli animali e peso degli organi;
- esito dell'esame necroscopico;
- una descrizione particolareggiata di tutti i reperti istopatologici;
- dati relativi all'assorbimento, se disponibili;
- ove del caso, elaborazione statistica dei risultati.

*Discussione dei risultati.**Conclusioni.***RIFERIMENTI**

Il presente metodo corrisponde al metodo OCSE TG 407.*

B.8. TOSSICITÀ A DOSE RIPETUTA (28 GIORNI) PER INALAZIONE

1 METODO

1.1 INTRODUZIONE

È utile avere informazioni preliminari sulla distribuzione delle dimensioni delle particelle, la tensione di vapore, il punto di fusione, il punto di ebollizione, il punto di infiammabilità e la esplosività (se del caso) della sostanza.

Vedi anche introduzione generale, parte B

1.2 DEFINIZIONI

Vedi introduzione generale, parte B

1.3 SOSTANZE DI RIFERIMENTO

Nessuna

1.4 PRINCIPIO DEL METODO DI SAGGIO

Diversi gruppi di animali da esperimento sono esposti quotidianamente per un periodo determinato a concentrazioni graduate della sostanza in esame; si utilizza una concentrazione per gruppo, somministrata per 28 giorni. Se si fa uso di un veicolo per ottenere una concentrazione appropriata della sostanza in esame nell'atmosfera, si dovrà prevedere anche un gruppo di animali di controllo trattati con il veicolo. Durante il periodo di trattamento, gli animali vengono esaminati quotidianamente per rilevare i sintomi di tossicità. Gli animali che muoiono durante il saggio e quelli che sopravvivono sono sottoposti a necropsia alla fine del saggio.

1.5 CRITERI DI QUALITÀ

Nessuno

1.6 DESCRIZIONE DEL METODO DI SAGGIO

1.6.1 Preparazioni

Per almeno 5 giorni prima dell'esperimento gli animali sono mantenuti nelle stesse condizioni di stabulazione e di alimentazione dell'esperimento. Prima del saggio, gli animali, che dovranno essere giovani e sani, sono scelti con metodo casuale e assegnati ai vari gruppi previsti. Se necessario, alla sostanza in esame può essere aggiunto un veicolo idoneo per facilitare la generazione di una concentrazione appropriata della sostanza in esame nell'atmosfera. Se per facilitare il dosaggio si utilizza un veicolo o altri additivi, questi dovranno non produrre effetti tossici. Se appropriato, possono essere utilizzati i dati storici.

1.6.2 Condizioni per il saggio

1.6.2.1 Animali da esperimento

Salvo controindicazione, il ratto è la specie d'elezione. Si dovranno utilizzare animali giovani e sani da ceppi di laboratorio comunemente usati.

All'inizio dello studio, l'intervallo di variazione ponderale degli animali usati non dovrebbe superare $\pm 20\%$ del valore medio.

1.6.2.2. Numero e sesso

Per ogni gruppo in esame dovranno essere utilizzati almeno 10 animali (5 di sesso maschile e 5 di sesso femminile). Le femmine dovrebbero essere nullipare e non gravide. Ove siano programmati sacrifici intermedi, il numero degli animali dovrà essere aumentato per includere quello degli animali da sacrificare prima del termine della prova. Inoltre, un gruppo satellite di 10 animali (5 animali per sesso) può essere sottoposto al trattamento con il livello superiore di dosaggio per 28 giorni ed esaminato, nei seguenti 14 giorni, per quanto riguarda la reversibilità o la persistenza o l'insorgenza ritardata degli effetti tossici. Inoltre si userà in tale caso, un gruppo satellite pure di 10 animali di controllo (5 animali per sesso).

1.6.2.3. Concentrazioni di esposizione

Sono richieste almeno tre concentrazioni con un controllo, oppure, se viene utilizzato un veicolo, un controllo del veicolo (corrispondente alla massima concentrazione del veicolo). Gli animali del gruppo di controllo dovranno essere trattati in modo identico agli animali dei gruppi trattati, ad eccezione del trattamento con la sostanza in esame. La massima concentrazione dovrebbe produrre effetti tossici, ma senza causare mortalità, o almeno causando una mortalità molto bassa. La concentrazione più bassa non dovrebbe causare alcun sintomo di tossicità. Nei casi in cui sia possibile stimare l'esposizione umana prevista, il livello di dosaggio più basso dovrebbe superare questo livello. Dal punto di vista ottimale la concentrazione intermedia dovrebbe produrre effetti tossici minimi. Nel caso in cui siano utilizzate più concentrazioni intermedie, queste dovrebbero essere intervallate in modo tale da produrre una graduazione di effetti tossici. Nei gruppi esposti alle concentrazioni bassa e intermedia e nei controlli, l'incidenza dei decessi dovrebbe essere bassa al fine di consentire una valutazione significativa dei risultati.

1.6.2.4. Tempo di esposizione

La durata dell'esposizione giornaliera dovrà essere di 6 ore. Tuttavia, per esigenze specifiche, si possono utilizzare esposizioni di diversa durata.

1.6.2.5. Apparecchiature

Gli animali dovranno essere esposti al composto in dispositivi per l'inalazione appositamente progettati per consentire un flusso dinamico dell'aria di almeno 12 ricambi l'ora per garantire un adeguato contenuto di ossigeno e un'atmosfera uniformemente distribuita. Qualora sia usata una camera, essa deve essere progettata in modo da minimizzare l'affollamento degli animali da esperimento e al tempo stesso rendere massima l'esposizione mediante inalazione alla sostanza in esame. Come regola generale per garantire la stabilità dell'atmosfera della camera, il «volume» complessivo degli animali di saggio non dovrebbe superare il 5 % di quello della camera di saggio. Si può ricorrere ad una esposizione oro-nasale, della sola testa, oppure di tutto il corpo in camera individuale; le prime due modalità d'esposizione renderanno minima l'assunzione delle sostanze attraverso altre vie.

1.6.2.6. Periodo di osservazione

Durante l'intero trattamento e il periodo di recupero, gli animali dovranno essere esaminati quotidianamente per rilevare i segni di tossicità. Il momento del decesso e il momento in cui si manifestano e scompaiono i sintomi di tossicità dovranno essere registrati.

1.6.3. Procedimento

Gli animali vengono esposti giornalmente alla sostanza in esame per 5-7 giorni alla settimana per un periodo di 28 giorni. Gli animali di ogni gruppo satellite, previsto per proseguire le osservazioni, dovranno essere tenuti per altri 14 giorni, senza alcun trattamento, al fine di rilevare la scomparsa oppure la persistenza degli effetti tossici. L'esperimento dovrà essere effettuato ad una temperatura di $22^{\circ}\text{C} \pm 3^{\circ}\text{C}$.

Dal punto di vista ottimale, l'umidità relativa dovrà essere mantenuta tra il 30 e il 70 % ma, in taluni casi (ad esempio prove di alcuni aerosol), ciò può non essere realizzabile. Mantenendo una leggera pressione negativa all'interno della camera (≤ 5 mm d'acqua) si impedirà il trafileamento della sostanza in esame nell'area circostante. Durante l'esposizione, la somministrazione di cibo e acqua dovrebbe essere sospesa.

Dovrà essere realizzato un sistema dinamico d'inalazione con un adeguato sistema analitico di controllo della concentrazione. Si raccomanda di effettuare un esperimento di prova per stabilire le concentrazioni idonee di esposizione. La velocità di flusso dell'aria dovrà essere regolata in modo da rendere uniformi le condizioni nella camera di esposizione. Il sistema dovrebbe consentire di raggiungere al più presto possibile le condizioni d'esposizione stabili.

Dovranno essere misurati o controllati

- (a) la velocità del flusso d'aria (in continuo),
- (b) la concentrazione effettiva della sostanza in esame nella zona di respirazione. Durante il periodo giornaliero di esposizione, la concentrazione non dovrà variare oltre il $\pm 15\%$ del valore medio. Tuttavia, nel caso di alcuni aerosol, questo livello di controllo potrebbe non essere realizzabile, e sarebbe quindi accettabile un intervallo più ampio. Per tutta la durata dello studio, le concentrazioni dovranno essere mantenute per quanto possibile costanti da un giorno all'altro. Per gli aerosol, si dovrà eseguire almeno un'analisi delle dimensioni di particelle per gruppo di prova e per settimana.
- (c) Temperatura e umidità, in continuo se possibile

Durante e dopo l'esposizione si procede all'effettuazione e alla registrazione sistematica delle osservazioni, registri individuali dovranno essere mantenuti per ciascun animale. Tutti gli animali dovranno essere esaminati giornalmente e dovranno essere registrati i sintomi di tossicità, compresi il momento del loro insorgere, il loro grado e la loro durata. Le osservazioni effettuate dovrebbero comprendere le alterazioni della cute e del pelo, degli occhi, delle membrane mucose e dei sistemi respiratorio, circolatorio, nervoso autonomo e centrale, dell'attività somatomotoria e del comportamento dell'animale. La misura del peso degli animali dovrà essere effettuata ogni settimana. Si raccomanda, inoltre, che anche il consumo di alimento sia misurato ogni settimana. L'osservazione regolare degli animali è necessaria per minimizzare la perdita di animali da studiare causata da cannibalismo, autolisi dei tessuti o errata collocazione. Al termine dello studio, gli animali sopravvissuti, esclusi quelli del gruppo satellite, vengono sottoposti ad esame necroscopico. Gli animali moribondi e gli animali in stato di grave sofferenza o dolore dovrebbero essere rimossi appena notati, soppressi umanamente e sottoposti a necroscopia.

Al termine del saggio tutti gli animali, compresi quelli di controllo, saranno sottoposti ai seguenti esami

1. ematologia, comprendente almeno l'ematocrito, la concentrazione di emoglobina, la conta degli eritrociti, la conta totale e differenziale dei leucociti e una misura del potenziale di coagulazione,
2. biochimica clinica del sangue, comprendente almeno un parametro della funzionalità epatica e renale nel siero: alanina aminotransferasi (prima conosciuta come glutammico-piruvico transaminasi), aspartato aminotransferasi (prima conosciuta come glutammico-ossalacetico transaminasi), azoto ureico, albumina, creatinina ematica, bilirubina totale e proteine sieriche totali

Altre determinazioni che possono risultare necessarie per una adeguata valutazione tossicologica, comprendono il calcio, il fosforo, il cloruro, il sodio, il potassio, il glucosio a digiuno, l'analisi dei lipidi, gli ormoni, l'equilibrio acido/base, la metaemoglobina, l'attività colinesterasica.

Ove necessario, si possono effettuare altre analisi biochimico-cliniche per estendere l'indagine degli effetti osservati

1.6.3.1 Necroscopia

Tutti gli animali usati nello studio dovrebbero essere sottoposti a necroscopia completa. Per evitare la disidratazione, almeno il fegato, i reni, le ghiandole surrenali, i polmoni e i testicoli dovrebbero essere pesati a umido appena possibile dopo la dissezione. Organi e tessuti (il tratto respiratorio, fegato, reni, milza, testicoli, ghiandole surrenali, cuore e qualsiasi organo presentante lesioni macroscopiche o variazioni delle dimensioni) dovrebbero essere conservati in un materiale idoneo per un eventuale futuro esame istopatologico. I polmoni dovrebbero essere asportati intatti, pesati e trattati con un fissatore idoneo ad assicurare che la struttura dei polmoni venga mantenuta.

1.6.3.2 Esame istopatologico

Gli organi e i tessuti degli animali del gruppo trattato con la concentrazione più elevata e del gruppo di controllo dovranno essere sottoposti ad esame istologico. Gli organi e i tessuti che presentano alterazioni attribuibili alla sostanza in esame, somministrata al più alto livello di dosaggio, dovranno essere esaminati in tutti i gruppi trattati con i dosaggi inferiori. Gli animali di ogni gruppo satellite dovranno essere sottoposti ad esame istologico, in particolare per gli organi e i tessuti che risultano colpiti da effetti tossici negli altri gruppi trattati.

2 DATI

I risultati dovranno essere riassunti sotto forma di tabelle indicanti, per ogni gruppo trattato, il numero di animali all'inizio e il numero di animali che presentano ciascun tipo di lesione.

3. RELAZIONE

3.1. RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- specie, ceppo, origine degli animali, condizioni ambientali, dieta, ecc.;
- condizioni del saggio:

Descrizione dell'apparecchiatura di esposizione, incluso il disegno, tipo, dimensioni, la fonte d'aria, il sistema per la formazione degli aerosol, il metodo di condizionamento dell'aria, il trattamento dell'aria di scarico e il metodo di stabulazione degli animali in una camera sperimentale, quando questa venga usata. Dovrebbe essere fornita una descrizione della strumentazione usata per misurare la temperatura, l'umidità e, se del caso, la stabilità delle concentrazioni di aerosol o la distribuzione delle dimensioni delle particelle.

Dati relativi all'esposizione:

Essi dovrebbero essere tabulati e presentati con valori medi e con una misura della variabilità (ad esempio deviazione standard) e dovrebbero includere:

- a) velocità del flusso d'aria attraverso l'apparecchiatura di inalazione;
 - b) temperatura e umidità dell'aria;
 - c) concentrazioni nominali (quantitativo globale della sostanza in esame introdotta nel dispositivo di inalazione diviso per il volume dell'aria);
 - d) tipo di veicolo, se usato;
 - e) concentrazioni effettive nella zona di respirazione;
 - f) diametro aerodinamico mediano in massa (DAMM) e deviazione standard geometrica (DSG);
- dati relativi agli effetti tossici per sesso e per concentrazione;
 - momento del decesso durante lo studio, o se gli animali sono sopravvissuti sino al suo termine;
 - descrizione di effetti tossici o altri effetti; livello senza effetti;
 - momento in cui è stato rilevato ciascun sintomo anormale e suo decorso;
 - dati relativi al consumo di alimento e al peso corporeo;
 - analisi ematologiche effettuate e loro risultati;
 - analisi biochimiche-cliniche effettuate e loro risultati;
 - risultati della necropsopia;
 - descrizione dettagliata di tutti i risultati istopatologici;
 - elaborazione statistica dei risultati, ove possibile;
 - discussione dei risultati;
 - interpretazione dei risultati.

3.2. VALUTAZIONE E INTERPRETAZIONE

Vedi introduzione generale, parte B

4. BIBLIOGRAFIA

B.9 TOSSICITÀ A DOSE RIPETUTA (28 GIORNI) PER VIA CUTANEA

1 METODO

1.1 INTRODUZIONE

Vedi introduzione generale, parte B

1.2 DEFINIZIONI

Vedi introduzione generale, parte B

1.3 SOSTANZA DI RIFERIMENTO

Nessuna

1.4 PRINCIPIO DEL METODO DI SAGGIO

La sostanza in esame è applicata ogni giorno sulla pelle di alcuni gruppi di animali da esperimento, in dosi graduate, un livello di dose per gruppo, per un periodo di 28 giorni. Durante il periodo di applicazione, gli animali vengono osservati quotidianamente per rilevare i sintomi di tossicità. Si sottopongono a necropsopia gli animali morti durante la prova e al termine del saggio vengono sottoposti a necropsopia gli animali sopravvissuti.

1.5. CRITERI DI QUALITÀ

Nessuno

1.6 DESCRIZIONE DEL METODO DI SAGGIO

1.6.1 Preparazioni

Per un periodo di almeno 5 giorni prima della prova gli animali sono mantenuti nelle stesse condizioni di stabulazione e di alimentazione del saggio. Prima del saggio gli animali, che dovranno essere giovani e sani, sono scelti con metodo casuale e assegnati ai gruppi previsti per il trattamento e per il controllo. Poco prima dell'esperimento si effettua il taglio del pelo nella parte dorsale del corpo degli animali. Si può procedere alla rasatura, ma essa dovrebbe essere effettuata circa 24 ore prima dell'esperimento. Di norma è necessario ripetere il taglio o la rasatura a intervalli di circa una settimana. Durante il taglio o la rasatura si dovrà badare a non ledere la cute dell'animale. Per l'applicazione della sostanza in esame, si dovrebbe preparare almeno il 10 % della superficie corporea. Nel determinare l'entità dell'area da preparare e le dimensioni della copertura è opportuno tenere presente il peso dell'animale. Le sostanze solide, che possono essere ridotte in polvere se appropriato, dovranno essere inumidite sufficientemente con acqua o, se necessario, con un veicolo adatto ad assicurare un buon contatto con la pelle. In generale le sostanze liquide sono saggiate in forma non diluita. Dal punto di vista ottimale, applicazioni quotidiane vengono effettuate sulla base di 5-7 giorni per settimana.

1.6.2 Condizioni per il saggio

1.6.2.1 Animali per l'esperimento

Possono essere utilizzati ratti adulti, conigli o porcellini d'India. Si possono utilizzare altre specie animali, ma il loro uso dovrà essere giustificato.

All'inizio dello studio l'intervallo di variazione di peso degli animali non dovrebbe superare $\pm 20\%$ del valore medio.

1.6.2.2. Numero e sesso

Per ciascun livello di dosaggio dovrebbero essere utilizzati almeno 10 animali (5 di sesso femminile e 5 di sesso maschile) con cute sana. Le femmine dovrebbero essere nullipare e non gravide. Qualora siano stati programmati sacrifici intermedi di alcuni animali, il numero degli animali dovrà essere aumentato per includere quello degli animali da sacrificare prima del termine della prova. Inoltre, un altro gruppo (gruppo satellite) di 10 animali (5 animali per sesso) può essere sottoposto al trattamento con il livello massimo di dosaggio per 28 giorni e tenuto in osservazione per 14 giorni dopo il trattamento per rilevare la reversibilità, la persistenza o l'insorgenza ritardata degli effetti tossici. Inoltre si utilizzerà in tale caso pure un gruppo satellite di 10 animali di controllo (5 animali per sesso).

1.6.2.3. Livelli di dosaggio

Sono richiesti almeno 3 livelli di dosaggio, almeno 6 ore al giorno, con un gruppo di controllo oppure, nel caso venga usato un veicolo, con un gruppo di controllo del veicolo. L'applicazione della sostanza in esame dovrebbe essere effettuata ogni giorno alla stessa ora e modificata ad intervalli (settimanali e bisettimanali) al fine di mantenere un livello di dosaggio costante in funzione del peso dell'animale. Gli animali del gruppo di controllo dovranno essere trattati in modo identico agli animali del saggio, ad eccezione che per l'applicazione delle sostanze da saggiare.

Se, per facilitare il dosaggio, viene utilizzato un veicolo, al gruppo di controllo dovrà essere somministrato il veicolo allo stesso modo che ai gruppi trattati e nella stessa quantità somministrata al gruppo con il dosaggio più elevato. Il livello di dosaggio più elevato della sostanza in esame dovrebbe causare effetti tossici ma senza causare mortalità oppure causando una mortalità molto limitata. Il livello di dosaggio più basso non dovrebbe provocare alcun sintomo di tossicità. Nei casi in cui vi sia una stima utilizzabile dell'esposizione umana, il livello di dosaggio più basso dovrebbe superarla. Dal punto di vista ottimale, il livello intermedio dovrebbe provocare effetti tossici osservabili minimi. Nei casi in cui siano usati più livelli di dosaggio intermedi, essi dovrebbero essere intervallati al fine di causare una graduazione di effetti tossici. Nei gruppi a livello di dosaggio basso e medio e di controllo, l'incidenza dei decessi dovrebbe essere bassa per consentire una valutazione significativa dei risultati.

Se l'applicazione della sostanza in esame dovesse causare una grave irritazione della cute, sarà opportuno ridurne le concentrazioni, e ciò può causare una diminuzione oppure l'assenza degli altri effetti tossici al livello di dosaggio più elevato. Inoltre, se la cute è stata gravemente danneggiata, può essere necessario interrompere il saggio e iniziargli uno nuovo a concentrazioni più basse.

1.6.2.4. Saggio limite

Qualora un saggio preliminare, effettuato con un livello di dosaggio di 1 000 mg/kg di peso corporeo, oppure con una dose superiore in relazione all'eventuale esposizione umana, se nota, non causi effetti tossici, ulteriori saggi possono essere considerati non necessari.

1.6.2.5. Periodo di osservazione

Gli animali da esperimento dovrebbero essere esaminati quotidianamente al fine di rilevare i segni della tossicità. Il momento del decesso e quello in cui appaiono e scompaiono i sintomi di tossicità dovrebbero essere registrati.

1.6.3. Procedimento

Ogni gabbia dovrebbe contenere un solo animale. Da un punto di vista ottimale, la sostanza in esame viene applicata agli animali 7 giorni la settimana per un periodo di 28 giorni. Gli animali di ogni eventuale gruppo satellite previsto per proseguire le osservazioni dovrebbero essere tenuti per altri 14 giorni, senza subire trattamenti, al fine di rilevare l'eventuale guarigione o la persistenza degli effetti tossici. La durata dell'esposizione dovrebbe essere almeno di 6 ore/giorno.

La sostanza in esame dovrebbe essere applicata uniformemente su un'area pari a circa il 10 % della superficie corporea totale. Per le sostanze altamente tossiche, la superficie coperta può essere inferiore, ma la maggior parte dell'area trattata dovrebbe essere ricoperta da uno strato per quanto possibile sottile e uniforme.

Durante il periodo di esposizione, la sostanza in esame viene tenuta a contatto della cute mediante una garza porosa e un cerotto non irritante. La parte su cui viene applicata la sostanza dovrà essere ulteriormente coperta in modo opportuno per tenere ferma la garza e la sostanza in esame e affinché gli animali non possano ingerire la sostanza stessa. Dispositivi per la limitazione dei movimenti possono essere utilizzati per impedire agli animali di ingerire la sostanza in esame, ma non è consigliabile l'immobilizzazione completa dell'animale. Come alternativa si può usare un «dispositivo protettivo a collare».

Alla fine del periodo di esposizione, la sostanza residua dovrà essere rimossa utilizzando acqua, se possibile, o altri prodotti idonei per la pulizia della pelle

Tutti gli animali dovranno essere esaminati quotidianamente e dovranno essere registrati i segni di tossicità, inclusi il momento dell'insorgenza, il loro grado e durata

Le osservazioni dovrebbero includere le alterazioni della cute e del pelo, degli occhi e delle membrane mucose, e anche dei sistemi respiratorio, circolatorio, nervoso autonomo e centrale, dell'attività somatomotoria e del comportamento dell'animale. La misura del peso degli animali dovrà essere effettuata ogni settimana. Si raccomanda, inoltre, che il consumo sia anche misurato ogni settimana. L'esame periodico degli animali è necessario per impedire la perdita degli animali dello studio, dovuta a cause come cannibalismo, autolisi dei tessuti o errata collocazione. Al termine del saggio, tutti gli animali sopravvissuti, ad eccezione del gruppo satellite, sono sottoposti a necropsopia. Gli animali moribondi e gli animali in condizioni di grave sofferenza o dolore dovranno essere rimossi appena notati, soppressi umanamente e sottoposti a necropsopia

Al termine del saggio tutti gli animali, compresi quelli di controllo, saranno sottoposti ai seguenti esami

- (i) ematologia, comprendente almeno l'ematocrito, la concentrazione di emoglobina, la conta degli eritrociti, la conta totale e differenziale dei leucociti e una misura del potenziale di coagulazione,
- (ii) biochimica clinica del sangue, comprendente almeno un parametro della funzionalità epatica e renale nel siero: alanina aminotransferasi (prima conosciuta come glutammico-piruvico transaminasi), aspartato aminotransferasi (prima conosciuta come glutammico-ossalacetico transaminasi), azoto ureico, albumina, creatinina ematica, bilirubina totale e proteine sieriche totali

Altre determinazioni, che possono risultare necessarie per un'adeguata valutazione tossicologica, comprendono il calcio, il fosforo, il cloruro, il sodio, il potassio, il glucosio a digiuno, l'analisi dei lipidi, gli ormoni, l'equilibrio acido/base, la metaemoglobina, l'attività colinesterasica

Per estendere l'indagine degli effetti osservati, se necessario, si possono utilizzare ulteriori esami biochimico-clinici

1.6.4 Necropsopia

Tutti gli animali dello studio dovranno essere sottoposti a necropsopia completa. Per evitare la disidratazione, il fegato, i reni, le ghiandole surrenali e i testicoli dovrebbero essere pesati unificati al più presto possibile dopo la dissezione. Gli organi e i tessuti, cioè la cute normale e trattata, il fegato, i reni, la milza, i testicoli, le ghiandole surrenali, il cuore e gli organi bersaglio (cioè gli organi che presentano lesioni macroscopiche o variazioni di dimensioni) dovranno essere conservati in un mezzo adatto per l'eventuale futuro esame istopatologico

1.6.5 Esame istopatologico

Gli organi e i tessuti degli animali del gruppo ad alto dosaggio e del gruppo di controllo opportunamente preservati dovranno essere sottoposti ad esame istologico. Gli organi e i tessuti che presentano lesioni attribuibili alla sostanza in esame somministrata al dosaggio più elevato dovranno essere esaminati anche per i gruppi a dosaggio inferiore. Gli animali dell'eventuale gruppo satellite dovranno essere sottoposti ad esame istologico, in particolare per gli organi e i tessuti che risultano colpiti da effetti tossici negli altri gruppi trattati

2 DATI

I risultati dovranno essere riassunti in una tabella indicante, per ogni gruppo trattato, il numero di animali all'inizio del saggio e il numero di animali che mostra ciascun tipo di lesione

Tutti i risultati osservati dovranno essere valutati con un adeguato metodo statistico. Può essere utilizzato qualsiasi metodo statistico riconosciuto

3. RELAZIONE**3.1. RELAZIONE SUL SAGGIO**

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- dati sugli animali (specie, ceppo, origine, condizioni ambientali, dieta, ecc.);
- condizioni di prova (incluso il tipo di medicazione: occlusiva o non occlusiva);
- livello di dosaggio (incluso il veicolo, se usato) e concentrazioni;
- livello senza effetti, dove possibile;
- effetti tossici per sesso e dosaggio;
- il momento del decesso durante il saggio, oppure se gli animali sono sopravvissuti sino al termine;
- effetti tossici o altri effetti;
- momento dell'osservazione di ciascun sintomo anomalo e suo successivo decorso;
- dati relativi al consumo di alimenti e al peso corporeo;
- esami ematologici effettuati e loro risultati;
- esami biochimico-clinici effettuati e loro risultati;
- risultati della necropsopia;
- descrizione dettagliata di tutti i risultati istopatologici;
- elaborazione statistica dei risultati, ove possibile;
- discussione dei risultati;
- interpretazione dei risultati.

1.4 PRINCIPIO DEL METODO DI SAGGIO

Il test citogenetico *in vitro* è un test di mutagenesi a breve termine per la rivelazione di aberrazioni cromosomiche strutturali nelle cellule di mammifero in coltura. Possono essere utilizzate sia colture di linee cellulari stabilizzate che colture cellulari primarie. Dopo esposizione alle sostanze chimiche d'esame con e senza sistema di attivazione metabolica appropriato, le colture cellulari vengono trattate con inibitori del fuso, come colchicina, per accumulare le cellule allo stadio di metafase della mitosi (metafase c). Le cellule sono raccolte in tempi adeguati e vengono allestiti dei preparati cromosomici. Le preparazioni sono colorate e le metafasi sono analizzate per individuare le anomalie cromosomiche.

1.5 CRITERI DI QUALITÀ

Nessuno

1.6 DESCRIZIONE DEL METODO DI SAGGIO

1.6.1 Preparazioni

1.6.1.1 Cellule

Si utilizzano linee cellulari stabilizzate o colture di cellule primarie, per esempio cellule di criceto cinese e linfociti umani. Le sostanze chimiche da esaminare vengono preparate in terreno di coltura o sciolte in veicoli appropriati prima del trattamento delle cellule.

1.6.1.2 Sistema di attivazione metabolica

Le cellule vanno esposte alla sostanza in esame sia in presenza che in assenza di un sistema appropriato di attivazione metabolica. Il sistema più comunemente usato è una frazione post mitocondriale integrata di cofattori, preparata partendo da fegati di roditori trattati con agenti induttori di enzimi.

1.6.2 Condizioni per il saggio

Numero di colture

Per ogni punto dell'esperimento si usano almeno due colture.

Uso di controlli negativi e positivi

Come controlli negativi si impiegano solvente (quando il solvente non è costituito dal terreno di coltura o dall'acqua), miscela di attivazione con enzimi epatici, miscela di attivazione con enzimi epatici e solvente, e controlli non trattati. Ogni esperimento comporta anche un controllo positivo, quando viene impiegata la

miscela di attivazione con enzimi epatici per attivare la sostanza in esame, si deve usare come controllo positivo un composto noto per richiedere attivazione metabolica.

Dosi

Si usano almeno 3 dosi del composto in esame con almeno un intervallo d'un fattore logaritmico tra di esse; la dose più elevata deve inibire l'attività mitotica del 50 % circa o presentare qualche altro segno di citotossicità. Se non è tossica, la sostanza in esame deve esser saggiata fino al limite di solubilità, o fino ad una concentrazione massima di 5 mg/ml.

Condizioni di coltura:

Vanno impiegati terreno di coltura e condizioni d'incubazione (per esempio temperatura, recipienti di coltura, concentrazione di CO₂, e l'umidità) appropriate.

1.6.3. Procedimento

1.6.3.1 Preparazione delle colture

Linee cellulari stabilizzate: le cellule sono generate da colture di riserva (per esempio mediante tripsinizzazione o «scuotimento»), seminate in recipienti di coltura in densità appropriate e messe in incubazione a 37 °C.

Linfociti umani: un quantitativo di sangue intero eparinizzato è aggiunto a un terreno di coltura contenente fitoemoagglutinina, siero fetale bovino e antibiotici e viene posto in incubazione a 37 °C.

1.6.3.2. Trattamento delle colture con il composto in esame

(i) Trattamento senza miscela di attivazione con enzimi epatici

Se possibile, tutti i trattamenti devono coprire almeno il periodo di un intero ciclo cellulare e gli schemi di fissazione devono assicurare l'analisi delle prime mitosi post-trattamento di cellule trattate a differenti stadi del ciclo.

Quando il trattamento non copre la durata di un intero ciclo cellulare, i tempi di fissazione sono scelti in modo da campionare cellule a stadi diversi del ciclo cellulare durante il trattamento, per esempio G₁, S e G₂. La sostanza in esame è aggiunta a colture di linee cellulari stabilizzate quando sono nella fase di crescita esponenziale. Le colture di linfociti umani vengono trattate quando si trovano ancora in una condizione semisincrona.

(ii) Trattamento con miscela di attivazione di enzimi epatici

Per il trattamento, il composto in esame, combinato con il sistema di attivazione, deve essere presente il più a lungo possibile senza esercitare un effetto tossico sulle cellule. Se, per motivi di tossicità, questo trattamento non copre la durata di un intero ciclo cellulare, si scelgono molteplici tempi di fissazione in modo da campionare cellule a diversi stadi del ciclo cellulare nel corso del trattamento, ossia G₁, S e G₂.

Raccolta delle cellule:

Le colture cellulari sono trattate con l'inibitore del fuso per un tempo adeguato prima della raccolta. Ciascuna coltura è raccolta e trattata separatamente per la preparazione di cromosomi.

Sono necessari almeno due tempi di raccolta. Si raccomanda che uno coincida approssimativamente con un ciclo cellulare, e l'altro sia effettuato più tardi. Ciò serve a far sì che siano coperti tutti gli stadi del ciclo cellulare e a tener conto di ritardi del ciclo cellulare.

1.6.3.3. Preparazione di cromosomi

Le preparazioni di cromosomi comportano il trattamento ipotonico delle cellule, la fissazione, la disseminazione su vetrini e la colorazione.

Analisi:

Almeno 100 metafasi ben distribuite per coltura vengono analizzate per individuarne le aberrazioni cromosomiche. I vetrini ricevono, prima dell'analisi, un numero di codice. Nei linfociti umani si analizzano soltanto metafasi contenenti 46 centromeri. Nelle linee cellulari stabilizzate si analizzano solo metafasi contenenti un numero di centromeri pari al numero modale ± 2 .

In aggiunta, va valutato l'indice mitotico o qualche altro indice di citotossicità, ove appropriato, per ciascun livello di dosaggio durante la prova.

2. DATI

I dati sono presentati sotto forma di tabelle. Aberrazioni di tipo cromatidico («gaps», rotture, interscambi), cromosomico («gaps», rotture, «minutes», anelli, dicentrici, policentrici) e il numero di metafasi aberranti (con e senza «gaps») vengono registrati separatamente per tutte le colture trattate e di controllo.

I dati vengono valutati con metodi statistici appropriati.

I risultati sperimentali devono essere confrontati con controlli negativi provati in parallelo.

Si conducono almeno due esperimenti indipendenti. Tuttavia, se ciò può essere giustificato scientificamente, può essere sufficiente un esperimento singolo. Non è necessario eseguire il secondo in maniera identica all'esperimento iniziale. Al contrario può essere preferibile modificare certe condizioni sperimentali allo scopo di ottenere dati più utili.

3. RELAZIONE**3.1. RELAZIONE SUL SAGGIO**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

- cellule utilizzate;
- condizioni nelle quali è stato effettuato il test: composizione del terreno, concentrazione di CO₂, temperature d'incubazione, dosi, tempo di trattamento, durata del trattamento con l'inibitore del fuso mitotico e loro concentrazione, tipo di miscela d'attivazione di enzimi epatici usata, controlli positivi e negativi;
- numero di colture cellulari;
- numero di metafasi analizzate (dati indicati separatamente per ogni coltura);
- indice mitotico, o altra indicazione di citotossicità;
- tipo e numero di aberrazioni indicato separatamente per ogni coltura trattata e di controllo, numero modale di cromosomi nelle linee cellulari stabilizzate usate;
- valutazione statistica;
- discussione dei risultati;
- interpretazione dei risultati.

B.11. MUTAGENICITÀ (MAMMIFERI: MIDOLLO OSSEO — SAGGIO CITOGENETICO *IN VIVO* — ANALISI CROMOSOMICA)**1. METODO****1.1. INTRODUZIONE**

Vedi introduzione generale, parte B

1.2. DEFINIZIONI

Vedi introduzione generale, parte B

1.3. SOSTANZA DI RIFERIMENTO

Nessuna.

1.4. PRINCIPI DEL METODO DI SAGGIO

Questo test citogenetico *in vivo* è un test di mutagenesi a breve termine per l'individuazione di aberrazioni cromosomiche strutturali. Dette aberrazioni cromosomiche vengono generalmente valutate nelle prime mitosi successive al trattamento. Con i mutageni chimici la maggior parte delle aberrazioni provocate sono di tipo cromatidico.

Il test utilizza cellule di midollo osseo di mammiferi esposti a sostanze chimiche attraverso adeguate vie di somministrazione e successivamente sacrificati ad intervalli sequenziali. Gli animali vengono ulteriormente trattati, prima del sacrificio, con inibitori del fuso, quali la colchicina, per accumulare cellule allo stadio mitotico della metafase (c-metafase). A partire dalle cellule vengono ricavate preparazioni cromosomiche essiccate che vengono poi colorate; le metafasi vengono poi sottoposte ad analisi microscopica per individuare le aberrazioni cromosomiche.

1.5. CRITERI DI QUALITÀ

Nessuno.

1.6. DESCRIZIONE DEL METODO DI SAGGIO**1.6.1. Preparazioni**

Le sostanze chimiche in esame vengono disciolte in soluzione fisiologica. Qualora non siano solubili, vengono disciolte o messe in sospensione in solventi adatti.

Vengono utilizzate soluzioni fresche del composto in esame. Qualora venga utilizzato un solvente per facilitare il dosaggio, esso non deve interferire con il composto, né produrre effetti tossici.

1.6.2. Condizioni per il saggio**1.6.2.1. Animali sperimentali**

Vengono utilizzati roditori quali ratti, topi o criceti cinesi. Vengono scelti a caso soggetti giovani adulti, che vengono poi assegnati ai gruppi di trattamento e di controllo.

1.6.2.2. Numero e sesso

Si impiegano almeno 5 animali di sesso femminile e 5 di sesso maschile per ogni gruppo sperimentale e di controllo. Pertanto vanno sacrificati 10 animali per gruppo per tempo, se si includono nel programma sperimentale vari tempi di controllo del saggio dopo il trattamento. Per il gruppo di controllo positivo è sufficiente un singolo tempo di campionamento.

1.6.2.3 Via di somministrazione

In genere le sostanze in esame vanno somministrate in un'unico trattamento. Il trattamento può essere ripetuto a intervalli regolari sulla base di dati tossicologici. Tuttavia lo schema di trattamento ripetuto può essere applicato soltanto se la sostanza in esame non ha effetti citotossici sul midollo osseo. La somministrazione avviene in genere per via orale o mediante iniezione intraperitoneale. Altre vie di somministrazione possono essere adatte.

1.6.2.4 Controlli positivi e negativi

Come controllo positivo viene utilizzata una sostanza di cui è nota la capacità di produrre aberrazioni cromosomiche *in vivo*, inoltre anche un gruppo di controllo negativo (solvente) deve essere incluso nel piano di ogni esperimento.

1.6.2.5 Dosi

Per il «dossier» di base viene utilizzata una dose della sostanza in esame, che consiste nella dose massima tollerata o in quella che produce qualche indicazione di citotossicità come, ad esempio, la parziale inibizione della mitosi.

Per composti «non tossici» la dose massima (limite) da saggiare nel caso di singola somministrazione è di 2 000 mg/kg di peso corporeo.

Se si impiega un programma a dosi ripetute, la dose limite è 1 000 mg/kg di peso corporeo per giorno.

Possono essere utilizzate dosi aggiuntive qualora siano indicate da motivazioni scientifiche.

Qualora il test sia usato come prova di verifica vanno utilizzate almeno altre due dosi.

1.6.3 Procedimento

Il test può essere eseguito in due modi:

- (i) gli animali vengono trattati con il composto in esame una volta alla dose tollerata più elevata. In prima istanza, i campioni vengono prelevati 24 ore dopo il trattamento. Se a questo punto, i risultati sono chiaramente positivi può non essere necessario un ulteriore campionamento. Se tuttavia i risultati sono negativi o dubbi, poiché la cinetica del ciclo cellulare può essere influenzata dal composto chimico in esame, si effettuano un campionamento più precoce e uno più tardivo, adeguatamente distanziati in un intervallo che va da 6 a 48 ore.

Quando vengono usati livelli di dosaggio aggiuntivi, si dovrebbero prelevare campioni ad intervalli particolarmente sensibili ovvero, se questi non sono noti, 24 ore dopo il trattamento.

- (ii) Se informazioni farmacocinetiche e metaboliche suggeriscono un programma di trattamento ripetuto, si può utilizzare la somministrazione di dosi ripetute e i campioni dovrebbero essere prelevati 6 e 24 ore dopo l'ultimo trattamento.

Preparazione del midollo osseo

Prima di venire sacrificati, agli animali viene iniettata per via intraperitoneale un'adeguata dose di inibitore del fuso mitotico in modo da ottenere un adeguato numero di cellule in c-metafase. Si ottengono campioni di midollo osseo da ambedue i femori degli animali appena sacrificati, dopo applicazione di una soluzione isotonica. Dopo un adeguato trattamento ipotonico le cellule vengono fissate e quindi strisciate su vetrini. Dopo l'essiccazione si procede alla colorazione.

Analisi

Prima dell'analisi microscopica, ai vetrini viene attribuito un numero di codice. Per l'individuazione delle aberrazioni cromosomiche strutturali vengono analizzati, per ciascun animale, almeno 50 metafasi ben «aperte» con un numero completo di centromeri. In aggiunta, l'indice mitotico può essere determinato per ciascun animale.

2. DATI

I dati sono presentati sotto forma di tabelle. Le aberrazioni di tipo cromatidico e isocromatidico («gaps», rotture, interscambi), il numero di metafasi aberranti (con o senza «gaps») e gli indici mitotici, ove determinati, vengono registrati separatamente per tutti gli animali trattati e per quelli di controllo. Vengono inoltre registrate per ogni gruppo trattato e di controllo le medie e le deviazioni standard. I dati vengono valutati con metodi statistici appropriati.

3. RELAZIONE**3.1. RELAZIONE SUL SAGGIO**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

- specie, ceppo ed età degli animali utilizzati;
- numero di animali di ciascun sesso nei gruppi trattati e di controllo;
- condizioni del saggio: descrizione dettagliata dello schema di trattamento e di campionamento, livelli di dosaggio, durata del trattamento con l'inibitore del fuso usato e relativa concentrazione;
- numero di metafasi analizzate per animale;
- indici mitotici, ove determinati;
- tipo e numero di aberrazioni, indicate separatamente per ogni animale trattato e per ogni animale di controllo;
- sintomi di tossicità nel corso dello studio;
- valutazione statistica;
- discussione dei risultati;
- interpretazione dei risultati.

B.12. MUTAGENICITÀ, SAGGIO DEL MICRONUCLEO

1 METODO

1.1 INTRODUZIONE

Vedi introduzione generale, parte B

1.2 DEFINIZIONI

Vedi introduzione generale, parte B

1.3 SOSTANZE DI RIFERIMENTO

Nessuna

1.4 PRINCIPIO DEL METODO DI SAGGIO

Il saggio del micronucleo è un saggio *in vivo*, a breve termine, effettuato su mammiferi, per individuare danno cromosomico o dell'apparato mitotico ad opera di sostanze chimiche. Questo saggio si basa sulla constatazione di un aumento dei micronuclei negli eritrociti policromatici degli animali sottoposti al trattamento rispetto a quelli osservati negli animali di controllo.

I micronuclei sono formati da frammenti di cromosomi o da cromosomi interi perduti durante la mitosi. Quando gli eritroblasti si trasformano in eritrociti, il nucleo principale viene espulso, mentre il micronucleo può rimanere nel citoplasma. Per questo saggio vengono analizzati eritrociti policromatici del midollo osseo di animali opportunamente esposti alle sostanze in esame attraverso vie di somministrazione adatte. Il midollo osseo viene prelevato e vengono effettuati strisci, successivamente colorati. Gli eritrociti policromatici vengono esaminati al microscopio per individuare i micronuclei e viene stabilita la proporzione fra eritrociti policromatici e normocromatici.

1.5 CRITERI DI QUALITÀ

Nessuno

1.6 DESCRIZIONE DEL METODO DI SAGGIO

1.6.1 Preparazioni

Le sostanze chimiche vengono disciolte in soluzione fisiologica. Qualora non siano solubili, vengono disciolte o sospese in solventi adatti. Se viene utilizzato un solvente per facilitare il dosaggio, esso non deve interferire con il composto né produrre effetti tossici. Normalmente, vengono impiegate soluzioni fresche del composto in esame.

1.6.2 Condizioni del saggio

1.6.2.1 Animali sperimentali

Si raccomanda l'uso di topi, ma è possibile usare altri mammiferi. Vengono scelti a caso soggetti giovani adulti destinati ai gruppi di trattamento e ai gruppi di controllo.

1.6.2.2 Numero e sesso

Si impiegano almeno 5 animali di sesso femminile e 5 di sesso maschile per ogni gruppo sperimentale e di controllo. Pertanto vanno sacrificati 10 animali per ciascun intervallo di tempo se si includono nel programma sperimentale diversi tempi di saggio dopo il trattamento. Per il gruppo di controllo positivo è sufficiente un singolo tempo di campionamento.

1.6.2.3. Via di somministrazione

In genere le sostanze in esame dovrebbero essere somministrate un'unica volta. Il trattamento può essere ripetuto a intervalli regolari sulla base di dati tossicologici. Tuttavia lo schema di trattamento ripetuto può essere applicato soltanto se la sostanza in esame non ha effetti citotossici sul midollo osseo. La somministrazione avviene in genere per via orale o mediante iniezione intraperitoneale. Anche altre vie di somministrazione possono essere adeguate.

1.6.2.4 Controlli positivi e negativi

Per ogni esperimento vengono usati controlli positivi e negativi (solvente).

1.6.2.5 Dosi

Per il dossier di base viene utilizzata una dose della sostanza in esame che consiste nella dose massima tollerata o in quella che produce qualche indicazione di citotossicità come, ad esempio, un cambiamento del rapporto fra eritrociti policromatici e normocromatici.

Per composti «non tossici» la dose massima (limite) da studiare dopo somministrazione di una dose singola è di 2 000 mg/kg di peso corporeo.

Se si impiega un protocollo a dosi ripetute, la dose limite è 1 000 mg/kg di peso corporeo per giorno.

Possono essere utilizzate dosi addizionali qualora siano giustificate da motivazioni scientifiche.

Qualora il saggio sia usato come prova di verifica dovrebbero essere utilizzate almeno altre due dosi.

1.6.3. Procedimento

Il saggio può essere eseguito in due modi:

- (i) gli animali vengono trattati con il composto in esame una sola volta. I tempi di campionamento dovrebbero coincidere con la risposta massima del saggio, che varia con il composto in esame. Pertanto, si prelevano campioni di midollo osseo almeno due volte iniziando non prima di 12 ore dopo il trattamento e non oltre le 48 ore.

Quando vengono usati livelli di dosaggio addizionali, si dovrebbero prelevare campioni ad intervalli particolarmente sensibili ovvero, se questi non sono noti, 24 ore dopo il trattamento.

- (ii) Se informazioni farmacocinetiche e metaboliche suggeriscono un protocollo di trattamento ripetuto, si può utilizzare la somministrazione di dosi ripetute e i campioni dovrebbero essere prelevati una volta, non prima di 12 ore dopo l'ultimo trattamento.

Preparazione del midollo osseo:

Si ottengono campioni di midollo osseo da ambedue i femori di animali appena sacrificati e si sospendono in siero fetale di vitello. Le cellule vengono sedimentate mediante centrifugazione ed il surnatante viene scartato. Gocce della sospensione omogenea vengono disposte su vetrini e strisciate. Dopo l'essiccazione si procede alla colorazione.

Analisi:

Prima dell'analisi microscopica, ai vetrini viene attribuito un numero di codice. Vengono osservati almeno 1 000 eritrociti policromatici per animale, per determinare l'incidenza dei micronuclei.

Il rapporto fra eritrociti policromatici e normocromatici viene determinato per ciascun animale contando un totale di 1 000 eritrociti.

2 DATI

I dati sono presentati sotto forma di tabelle. Il numero di eritrociti policromatici osservati, il numero di eritrociti che presentano micronuclei e la percentuale delle cellule con micronuclei vengono elencati separatamente per ogni animale trattato e per ogni animale di controllo, come pure il rapporto fra eritrociti policromatici e normocromatici. Vengono inoltre elencate, per ogni gruppo di sperimentazione e di controllo, le medie e le deviazioni standard. I dati vengono valutati con metodi statistici appropriati.

3 RELAZIONE**3.1 RELAZIONE SUL SAGGIO**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

- specie, ceppo ed età degli animali utilizzati,
- numero di animali di ciascun sesso nei gruppi trattati e di controllo,
- condizioni del test: descrizione dettagliata dello schema del trattamento e del prelievo di campioni, dosi, dati relativi alla tossicità, controlli negativi e positivi,
- criteri adottati per il conteggio dei micronuclei,
- rapporto dose/effetto, ove possibile,
- sintomi di tossicità nel corso dello studio,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

3.2 VALUTAZIONE E INTERPRETAZIONI

B.13. MUTAGENICITÀ — BATTERI — *ESCHERICHIA COLI* — SAGGIO DI REVERSIONE

1. METODO

1.1. INTRODUZIONE

Vedi introduzione generale, parte B

1.2. DEFINIZIONI

Vedi introduzione generale, parte B

1.3. SOSTANZE DI RIFERIMENTO

Nessuna.

1.4. PRINCIPIO DEL METODO DI SAGGIO

Il sistema di reversione del triptofano (trp) in *Escherichia coli* è un test microbiologico che misura la reversione $trp^- \rightarrow trp^+$ indotta da sostanze chimiche che causano mutazioni del tipo «sostituzione di base» nel genoma del microorganismo.

I batteri sono esposti alla sostanza chimica in esame con e senza attivazione metabolica. Dopo un adeguato periodo d'incubazione in terreno minimo, le colonie revertanti vengono contate e confrontate con il numero di revertanti spontanei presenti in una coltura di controllo non trattata e/o trattata con solvente.

1.5. CRITERI DI QUALITÀ

Nessuno.

1.6. DESCRIZIONE DEL SAGGIO

Per l'analisi possono essere utilizzati i seguenti metodi: 1) il metodo della preincubazione; 2) il metodo della incorporazione diretta, in cui i batteri e la sostanza saggiata sono mescolati in uno strato di agar molle e versati sulla superficie di una piastra di terreno selettivo agarizzato.

1.6.1. Preparazioni

1.6.1.1. Batteri

I batteri vengono coltivati a 37 °C fin quasi al termine della fase di crescita esponenziale o all'inizio della fase stazionaria. La densità approssimativa delle cellule dovrebbe essere di 10^8 - 10^9 cellule per ml.

1.6.1.2. Attivazione metabolica

I batteri dovrebbero essere esposti alla sostanza in esame in presenza e assenza di un adeguato sistema di attivazione metabolica. Il sistema più comunemente usato è una frazione post-mitocondriale integrata di co-fattori preparata dal fegato di roditori trattati con agenti induttori di enzimi.

1 6 2 Condizioni del saggio

1 6 2 1 Ceppi

Si dovrebbero usare tre ceppi, WP2, WP2 uvr A e WP2 uvr A pKM 101. Si debbono usare metodi noti per la preparazione e per la conservazione delle colture. Debbono essere oggetto di controlli le richieste nutrizionali e l'identità genetica dei ceppi, la loro sensibilità alle radiazioni ultraviolette o alla mitomicina C e la resistenza all'ampicillina del ceppo WP2 uvr A pKM 101. I vari ceppi debbono anche produrre revertanti spontanei entro i valori limite attesi per ogni ceppo.

1 6 2 2 Terreni

Viene utilizzato un terreno adeguato per l'espressione e la selezione dei mutanti, con uno strato adeguato di agar molle sovrastante.

1 6 2 3 Controlli negativi e positivi

Vanno eseguiti controlli concomitanti del non trattato e del solvente. I controlli positivi vanno eseguiti per due motivi:

(i) Per confermare la sensibilità dei ceppi batterici.

Metilmetan solfonato, 4 nitrochinolina ossido o etilnitrosourea possono essere utilizzati come controlli positivi per i test in assenza di attivazione metabolica.

(ii) Per garantire l'attività di un adeguato sistema metabolico.

Un controllo positivo dell'attività di un sistema metabolico per tutti i ceppi consiste nell'utilizzazione di 2-amminoantracene. Quando possibile sarebbe opportuno effettuare un controllo positivo con una sostanza della stessa classe chimica del composto in esame.

1 6 2 4 Quantità di sostanza in esame per piastra

Vengono effettuati esperimenti con almeno 5 dosi diverse, con intervalli semilogaritmici tra di loro. Le sostanze sono saggiate fino al limite di solubilità o tossicità. La tossicità è evidenziata da una riduzione del numero di revertanti spontanei, da una diminuzione del fondo di crescita ovvero dal grado di sopravvivenza delle colture trattate. Le sostanze non tossiche dovrebbero essere saggiate fino alla concentrazione di 5 mg per piastra prima di essere considerate negative.

1 6 2 5 Condizioni d'incubazione

Le piastre vengono esposte in incubazione per un periodo variante da 48 a 72 ore a 37 °C.

1 6 3 Procedimento

Per il metodo di incorporazione diretta in piastra, senza attivazione enzimatica, la sostanza in esame viene aggiunta a 0,1 ml di coltura fresca e a 2,0 ml di agar molle. Per quanto riguarda quello con attivazione metabolica, si aggiungono all'agar molle 0,5 ml di miscela di attivazione di enzimi epatici, contenente un'adeguata quantità di frazione postmitocondriale, dopo l'aggiunta della sostanza in esame e dei batteri. Il contenuto di ogni tubo viene agitato e versato sulla superficie di una piastra con terreno selettivo agarizzato. Si lascia solidificare l'agar e le piastre vengono messe in incubazione a 37 °C per un periodo che va dalle 48 alle 72 ore.

Alla fine del periodo d'incubazione vengono contate le colonie revertanti per ciascuna piastra. Per quanto riguarda il metodo di preincubazione, una miscela contenente sostanza saggiata, 0,1 ml di coltura batterica fresca e un'adeguata quantità di miscela di attivazione di enzimi epatici o la stessa quantità di tampone viene preincubata prima di aggiungere 2,0 ml di agar molle. Tutte le altre fasi del procedimento sono uguali a quelle relative al metodo di incorporazione diretta.

Per ambedue i metodi ogni piastramento viene fatto almeno in triplicato.

2 DATI

Il numero di colonie revertanti per piastra viene riportato sia per la serie di controllo che per le serie trattate. Sia per la serie trattata che per quella di controllo si dovrebbe riportare il valore della conta di ogni singola piastra, il numero medio di colonie revertanti per piastra e le deviazioni standard.

I dati dovrebbero essere valutati con adeguati metodi statistici.

Si eseguono almeno due esperimenti indipendenti. Non è necessario eseguire il secondo in un modo identico all'esperimento iniziale. Al contrario può essere preferibile modificare certe condizioni sperimentali allo scopo di ottenere dati più utili.

3. RELAZIONE**3.1. RELAZIONE SUL SAGGIO**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

- batteri, ceppo usato;
- condizioni usate nell'esperimento: dosi, tossicità, composizione dei terreni; procedure di trattamento (preincubazione, incubazione); sistema di attivazione metabolica; sostanze di riferimento, controlli negativi;
- conta per piastre singole, numero medio di colonie revertanti per piastra, deviazione standard, rapporto dose/effetto se possibile;
- discussione dei risultati;
- interpretazione dei risultati.

1.6 DESCRIZIONE DEL METODO DI SAGGIO

1.6.1 Preparazioni

1.6.1.1 Batteri

Sono utilizzate colture batteriche fresche fatte crescere a 37 °C, sino alla tarda fase di crescita esponenziale o all'inizio di quella stazionaria. La densità delle cellule dovrebbe essere di circa 10⁸ - 10⁹ cellule per ml.

1.6.1.2 Attivazione metabolica

I batteri dovrebbero essere esposti alla sostanza in esame in presenza e assenza di un adeguato sistema di attivazione metabolica. Il sistema più comunemente usato è una frazione postmitocondriale integrata di coliformi preparata da fegato di roditori trattati con agenti induttori enzimatici.

1.6.2 Condizioni per il saggio

1.6.2.1 Ceppi

Debbono essere usati almeno quattro ceppi: TA 1535, TA 1537 o TA 97, TA 98 e TA 100, possono inoltre essere usati anche altri ceppi, quali il TA 1538 e TA 102. Debbono inoltre essere usati metodi noti per la preparazione per la conservazione delle colture. Debbono essere oggetto di controlli le richieste nutrizionali e l'identità genetica dei ceppi, nonché la loro sensibilità alle radiazioni ultraviolette e al cristallo violetto e la resistenza all'ampicillina. I vari ceppi debbono anche produrre revertanti spontanei entro i valori limite previsti per ogni ceppo.

1.6.2.2. *Terreni*

Viene usato un adeguato terreno selettivo con uno strato adeguato di agar molle sovrastante.

1.6.2.3. *Controlli positivi e negativi*

Vanno effettuati controlli paralleli non trattati e trattati col solvente. I controlli positivi vanno eseguiti per due motivi:

- (i) per confermare le sensibilità dei ceppi batterici.

I seguenti composti possono essere utilizzati per i saggi che non comportano attivazione metabolica:

Ceppo	Reversione in presenza di
TA 1535, TA 100	sodio azide
TA 1538, TA 98, TA 97	2-nitrofluorene
TA 1537	9-amminoacridina
TA 102	idroperossido di cumene

- (ii) Per garantire l'attività di un adeguato sistema metabolico.

Un controllo positivo dell'attività di un sistema metabolico per tutti i ceppi consiste nell'utilizzazione di 2-amminoantracene. Possibilmente sarebbe opportuno effettuare un controllo positivo con una sostanza della stessa classe chimica di quella del composto in esame.

1.6.2.4. *Quantità di sostanza in esame per piastra*

Vengono effettuati esperimenti con almeno 5 dosi diverse, con intervalli semilogaritmici tra di loro. Le sostanze sono saggiate fino al limite di solubilità o tossicità. La tossicità è evidenziata da una riduzione del numero di revertanti spontanei, da una riduzione del fondo di crescita ovvero dal grado di sopravvivenza delle colture trattate. Le sostanze non tossiche dovrebbero essere saggiate fino alla concentrazione di 5 mg per piastra prima di essere considerate negative.

1.6.2.5. *Condizioni d'incubazione*

Le piastre vengono esposte in incubazione per un periodo variante da 48 a 72 ore a 37 °C.

1.6.3. *Procedimento*

Per il metodo di incorporazione diretta in piastra, senza attivazione enzimatica, la sostanza in esame viene aggiunta a 0,1 ml di coltura fresca e a 2,0 ml di agar molle. Per quanto riguarda quello con attivazione metabolica, si aggiungono all'agar molle 0,5 ml di miscela di attivazione di enzimi epatici, contenente un'adeguata quantità di frazione postmitocondriale, dopo l'aggiunta della sostanza in esame e dei batteri. Il contenuto di ogni tubo viene agitato e versato sulla superficie di una piastra con terreno selettivo agarizzato. Si lascia solidificare l'agar e le piastre vengono messe in incubazione a 37 °C per un periodo che va dalle 48 alle 72 ore. Alla fine del periodo d'incubazione vengono contate le colonie revertanti per ciascuna piastra. Per quanto riguarda il metodo di preincubazione, una miscela contenente la sostanza saggiata, 0,1 ml di coltura batterica fresca e un'adeguata quantità di miscela di attivazione di enzimi epatici o la stessa quantità di tampone viene preincubata prima di aggiungere 2,0 ml di agar molle. Tutte le altre fasi del procedimento sono uguali a quelle relative al metodo di incorporazione diretta. Per ambedue i metodi ogni piastramento viene fatto almeno in triplicato.

2. *DATI*

Il numero di colonie revertanti per ciascuna piastra viene riportato sia per la serie di controllo che per le serie trattate. Sia per la serie trattata che per quella di controllo vanno riportati il valore della conta di ogni singola piastra, il numero medio di colonie revertanti per piastra e le deviazioni standard.

I dati vanno valutati con adeguati metodi statistici.

Si eseguono almeno due esperimenti indipendenti. Non è necessario eseguire il secondo in un modo identico all'esperimento iniziale. Al contrario può essere preferibile modificare certe condizioni sperimentali allo scopo di ottenere dati più utili.

3 RELAZIONE**3.1 RELAZIONE SUL SAGGIO**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni

- batteri, ceppo usato,
- condizioni usate nell'esperimento: dosi, tossicità, composizione dei terreni, procedure di trattamento (preincubazione, incubazione), sistema di attivazione metabolica, sostanze di riferimento, controlli negativi,
- conta per piastre singole, numero medio di colonie revertanti per piastra, deviazione standard, relazione dose/effetto se possibile,
- discussione dei risultati,
- interpretazione dei risultati

1.2 Definizioni

Vedi introduzione generale, parte B.

1.3 Sostanze di riferimento

Nessuna.

1.4 Principi del metodo di saggio

Per misurare l'induzione di mutazioni geniche indotte da agenti chimici, con e senza attivazione metabolica, può essere fatto uso di una varietà di ceppi aploidi e diploidi del lievito *Saccharomyces cerevisiae*.

Sono stati utilizzati sistemi di mutazione in avanti in ceppi aploidi, come la misura della mutazione da mutanti rossi, richiedenti adenina (*ade-1*, *ade-2*), a doppi mutanti bianchi richiedenti adenina; e sistemi selettivi come l'induzione della resistenza alla canavanina.

Il sistema di retromutazione più largamente convalidato comporta l'uso del ceppo aploide XV 185-14C che porta le mutazioni di tipo «senza senso» (*ochre*) *ade-2-1*, *arg-4-17*, *lys-1-1* e *trp-5-48*, le quali possono essere revertite da mutageni che inducono sostituzioni di base nel sito specifico o mutazioni che sopprimono «ochre». Il ceppo XV 185-14C porta altresì il marcatore *his-1-7*, mutazione di tipo «senso sbagliato» revertita principalmente da mutazioni nel secondo sito, e il marcatore *hom-3-10* che viene revertito da mutageni che inducono mutazioni del tipo «inserzione-delezione».

Fra i ceppi diploidi del *S. cerevisiae* il solo largamente convalidato è il ceppo *D₇*, omozigote per *ilv-1-92*.

1.5 Criteri qualitativi

Nessuno.

1.6 Descrizione del metodo di saggio

Preparati

È opportuno preparare le soluzioni delle sostanze in esame e dei composti di controllo o di riferimento, servendosi di un veicolo appropriato, al momento dell'effettuazione del test. Con i composti organici non solubili in acqua si devono usare soluzioni di solventi organici quali l'etanolo, l'acetone e il dimetilsolfossido (DMSO) a non più del 2 % in volume (v/v). La concentrazione finale del solvente non dovrebbe influenzare in modo significativo la vitalità cellulare e le caratteristiche di crescita.

Attivazione metabolica

Le cellule vanno esposte alle sostanze in esame sia in presenza che in assenza di un sistema appropriato di attivazione metabolica esogena.

Il sistema più comunemente usato è una frazione postmitocondriale integrata con cofattori, ottenuta dai fegati di roditori pretrattati con agenti che inducono enzimi. Per l'attivazione metabolica può essere appropriato anche l'uso di altre specie, di altri tessuti, di altre frazioni postmitocondriali o di altri procedimenti.

*Condizioni di effettuazione del saggio***Ceppi**

I ceppi più largamente usati negli studi sulle mutazioni geniche sono il ceppo aploide XV 185 14C e il ceppo diploide D. Possono essere appropriati anche altri ceppi.

Terreni di coltura

Per la determinazione della sopravvivenza delle cellule e del numero dei mutanti è fatto uso di terreni di coltura appropriati.

Uso di controlli negativi e positivi

È opportuno procedere in parallelo a controlli positivi, non trattati e con il solo solvente. Per ciascun evento genetico specifico vanno usate appropriate sostanze di controllo positivo.

Concentrazioni

Occorre far uso di almeno 5 concentrazioni adeguatamente intervallate della sostanza in esame. Per le sostanze tossiche la concentrazione più elevata usata nei test non deve ridurre la sopravvivenza a meno del 5-10%. Le sostanze relativamente insolubili in acqua vanno saggiate fino al loro limite di solubilità secondo procedimenti appropriati. Per le sostanze non tossiche completamente solubili in acqua la concentrazione massima va determinata caso per caso.

Condizioni di incubazione

Le piastre vengono incubate per 4-7 giorni a temperatura da 28° a 30 °C nell'oscurità.

Frequenze delle mutazioni spontanee

È opportuno usare subcolture con frequenze delle mutazioni spontanee entro i limiti accettati come normali.

Numero delle repliche

Per la determinazione dei prototrofi che si inducono per mutazione genica e della sopravvivenza cellulare è opportuno fare uso di almeno tre piastre di replica per concentrazione. Nel caso di esperimenti nei quali si usino marcatori a bassa frequenza di mutazione, quali h^{-} o trp^{-} , per poter ottenere dati aventi rilevanza statistica è necessario aumentare il numero delle piastre.

Procedimento

Il trattamento dei ceppi di *S. cerevisiae* viene normalmente effettuato secondo un procedimento di test in sospensione liquida con impiego di cellule quiescenti o in crescita. Gli esperimenti iniziali dovrebbero essere condotti su cellule in crescita. Si espongono alla sostanza in esame per una durata fino a 18 ore a temperatura da 28° a 37 °C e in agitazione $1-5 \times 10^7$ cellule/ml, in casi opportuni, nel corso del trattamento si aggiunge una quantità adeguata di un sistema di attivazione metabolica. Al termine del trattamento si procede alla centrifugazione ed al lavaggio delle cellule ed alla loro semina su un terreno di coltura appropriato. Dopo incubazione si analizzano le piastre per la determinazione della sopravvivenza e dell'induzione della mutazione genica.

Se il primo esperimento è negativo il secondo esperimento dovrebbe essere condotto su cellule quiescenti, se il primo esperimento è positivo, viene confermato in un appropriato esperimento indipendente.

2**DATI**

I dati devono essere presentati in forma di tabelle, con indicazione del numero delle colonie contate, del numero di mutanti, della sopravvivenza e della frequenza dei mutanti. Tutti i risultati devono essere confermati in un esperimento indipendente. I dati devono essere stabiliti secondo metodi statistici appropriati.

3. RELAZIONE

3.1 Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- ceppo usato,
- condizioni di effettuazione del test: cellule in fase stazionaria o in crescita, composizione dei terreni, temperatura e durata dell'incubazione, sistemi di attivazione metabolica,
- condizioni del trattamento: livelli di esposizione, procedimento e durata del trattamento, temperatura di trattamento, controlli positivi e negativi,
- numero delle colonie contate, numero di mutanti, sopravvivenza e frequenza dei mutanti, relazione dose/risposta se disponibile, valutazione statistica dei dati,
- discussione dei risultati,
- interpretazione dei risultati.

B.16. RICOMBINAZIONE MITOTICA *SACCHAROMYCES CEREVISIAE*

1 METODO

1.1 Introduzione

Vedi introduzione generale, parte B

1.2 Definizioni

Vedi introduzione generale, parte B

1.3 Sostanze di riferimento

Nessuna

1.4 Principi del metodo di saggio

La ricombinazione mitotica in *Saccharomyces cerevisiae* può essere rilevata fra geni (o in linea più generale fra un gene e il suo centromero) e all'interno dei geni. La prima delle due eventualità è denominata crossing-over mitotico e genera prodotti reciproci, mentre la seconda eventualità è per lo più non reciproca ed è denominata conversione genica. Il crossing-over viene generalmente determinato mediante la produzione di colonie o settori recessivi omozigoti in un ceppo eterozigote, mentre la conversione genica viene determinata attraverso la produzione di revertanti prototrofici in un ceppo auxotrofico eteroallelomorfo portante due diversi alleli del medesimo gene. I ceppi più comunemente usati per la rilevazione della conversione genica mitotica sono i ceppi D₄ (eteroallelomorfo in *ade 2* e *trp 5*), D₇ (eteroallelomorfo in *trp 5*), BZ₁₄ (eteroallelomorfo in *arg 4*) e JD1 (eteroallelomorfo in *his 4* e *trp 5*). Il crossing over mitotico produttore settori omozigoti di colore rosso e rosa può essere determinato nel ceppo D₁ o in D₇ (che misura anche la conversione genica mitotica e la retromutazione in *ilv 1-92*), essendo entrambi i ceppi eteroallelomorfi per alleli complementanti di *ade 2*.

1.5 Criteri qualitativi

Nessuno

1.6 Descrizione del metodo di saggio

Preparazioni

È opportuno preparare le soluzioni della sostanza in esame e dei composti di controllo o di riferimento, facendo uso di un solvente appropriato, al momento di procedere all'effettuazione dei test. Con i composti organici non solubili in acqua è opportuno usare solventi organici come l'etanolo, l'acetone e il dimetilsolfossido (DMSO) a non più del 2% (v/v). La concentrazione finale del solvente non dovrebbe alterare significativamente la vitalità cellulare e le caratteristiche di crescita.

Attivazione metabolica

Le cellule devono essere esposte alle sostanze in esame sia in presenza che in assenza di un sistema appropriato di attivazione metabolica esogena. Il sistema più comunemente usato è una frazione postmitocondriale supplementare con cofattori e ottenuta dai fegati di roditori pretrattati con agenti che inducono enzimi. Per l'attivazione metabolica può essere appropriato anche l'impiego di altre specie, di altri tessuti, di altre frazioni postmitocondriali o di altri procedimenti.

*Condizioni sperimentali**Ceppi*

I ceppi più frequentemente usati sono i ceppi diploidi D₄, D₇, D₁, e JD1. Può essere appropriato anche l'impiego di altri ceppi.

Terreni di coltura

Per la determinazione della sopravvivenza e della frequenza della ricombinazione mitotica si devono usare terreni di coltura appropriati.

Uso di controlli negativi e positivi

È opportuno effettuare in parallelo controlli positivi, controlli non trattati o trattati con solo solvente. Per ciascun tipo specifico di ricombinazione devono essere usate le appropriate sostanze di controllo positivo.

Concentrazioni

È opportuno fare uso di almeno cinque concentrazioni della sostanza in esame adeguatamente intervallate. Tra i fattori da prendere in considerazione vi sono la citotossicità e la solubilità. La concentrazione più bassa non deve produrre alcun effetto sulla vitalità cellulare. Per le sostanze tossiche, la più alta concentrazione saggiata non deve ridurre la sopravvivenza a meno del 5-10%. Le sostanze relativamente insolubili in acqua devono essere saggiate fino al loro limite di solubilità secondo procedimenti appropriati. Per le sostanze non tossiche altamente solubili in acqua la concentrazione massima del test va determinata caso per caso.

Le cellule possono essere esposte alle sostanze in esame in fase stazionaria o in fase di crescita per periodi fino a 18 ore. Nel caso di tempi di trattamento prolungati occorre tuttavia accertare mediante esame microscopico che nelle culture non vi sia formazione di spore, la cui presenza invaliderebbe il test.

Condizioni di incubazione

Le piastre vengono incubate nell'oscurità per 4-7 giorni a temperatura da 28 ° a 30 °C. Le piastre usate per l'analisi dei settori omozigoti di colore rosso e roseo derivanti dal crossing over mitotico vanno tuttavia tenute in frigorifero (4 °C) per un altro ciclo di uno o due giorni prima dell'analisi, per dare tempo allo sviluppo del pigmento nelle colonie ricombinanti.

Frequenze della ricombinazione mitotica spontanea

È opportuno usare subcolture con frequenze di ricombinazione mitotica spontanea entro i limiti accettati come normali.

Numero delle repliche

Per la determinazione dei prototrofi prodotti dalla conversione genica mitotica e per quella della sopravvivenza è opportuno fare uso di un minimo di tre piastre di replica per concentrazione. Nella determinazione della omozigosità recessiva derivante dal crossing-over mitotico il numero delle piastre va aumentato in modo da ottenere un numero adeguato di colonie.

Procedimento

Il trattamento dei ceppi di *S. cerevisiae* viene normalmente effettuato in un procedimento di test in sospensione liquida con cellule in fase stazionaria o in fase di crescita. Esperimenti iniziali dovrebbero essere condotti su cellule in fase di crescita. Si espongono alla sostanza in esame per una durata fino a 18 ore a temperatura da 28 ° a 37 °C con scuotimento $1 - 5 \times 10^7$ cellule/ml; nel corso del trattamento, nei casi opportuni si aggiunge una quantità adeguata di un sistema di attivazione metabolica. Al termine del trattamento si procede alla centrifugazione ed al lavaggio delle cellule ed alla loro semina su un terreno di coltura appropriato. Dopo l'incubazione si analizzano le piastre per la determinazione della sopravvivenza e dell'induzione della ricombinazione mitotica.

Se il primo esperimento è negativo il secondo dovrebbe essere eseguito su cellule quiescenti, se il primo esperimento è positivo, il secondo viene confermato in un esperimento indipendente appropriato.

DATI

I dati devono essere presentati in forma di tabelle, con indicazione del numero dei ricombinanti, della sopravvivenza e della frequenza dei ricombinanti.

Tutti i risultati devono essere confermati in un esperimento indipendente. I dati vanno stabiliti per valutazione secondo metodi statistici appropriati.

B.17. CELLULE DI MAMMIFERI IN VITRO SAGGIO DI MUTAZIONI GENICA

1 METODO

1.1 Introduzione

Vedi introduzione generale, parte B

1.2 Definizione

Vedi introduzione generale, parte B

1.3 Sostanze di riferimento

Nessuna

1.4 Principi del metodo di saggio

Per la rilevazione di mutazioni indotte da sostanze chimiche può essere fatto uso di sistemi di coltura di cellule di mammiferi. Fra i tipi di cellule più largamente usati figurano le cellule di linfoma di topo L 5178Y e le linee CHO e V-79 di cellule di hamster cinese. In queste linee cellulari i sistemi più comunemente usati misurano mutazioni nei loci della timidina chinasi (TK), della ipoxantina guanina fosforibosil transferasi (HPRT) ⁽¹⁾ e della Na^+/K^+ ATPase. I sistemi di mutazioni della TK e della HPRT evidenziano mutazioni del tipo «sostituzione di base» mutazioni del tipo «inserzione-delezione» e piccole delezioni, il sistema Na^+/K^+ segnala soltanto mutazioni del tipo «sostituzione di base».

Le cellule deficienti di timidina chinasi (TK), a causa della mutazione in avanti TK^+ - TK sono resistenti alla bromodeossipuridina (BrdU), alla fluorodeossipuridina (FdU) e alla trifluorotimidina (TFT) non essendo detti antimetaboliti incorporati in nucleotidi cellulari dalla timidina chinasi del sistema enzimatico «di recupero» i nucleotidi occorrenti per il metabolismo cellulare sono ottenuti unicamente dalla sintesi de novo. In presenza di timidina chinasi la BrdU, la FdU e la TFT sono per contro incorporate nei nucleotidi, con conseguente inibizione del metabolismo cellulare e della citotossicità. Le cellule mutanti sono così in grado di proliferare in presenza di BrdU, FdU o di TFT, mentre le cellule normali, che contengono timidina chinasi, non lo possono fare.

Analogamente le cellule con insufficienza di HPRT sono selezionate per resistenza alla 8 azaguanina (AG) o alla 6-tioguanina (TG). Le cellule con alterazione della Na^+/K^+ ATPase sono selezionate per resistenza alla ouabaina.

Per la determinazione della citotossicità si misura l'effetto della sostanza in esame sulla capacità di formazione di colonie (efficienza di clonaggio) o sui tassi di crescita delle colture. La determinazione della frequenza dei mutanti si effettua a sua volta seminando numeri noti di cellule in un terreno contenente l'agente selettivo per individuare le cellule mutanti, e in un terreno senza agente selettivo per determinare l'efficienza di clonaggio. Dopo un appropriato periodo di incubazione si contano le colonie. Le frequenze dei mutanti si calcolano in base al numero delle colonie di mutanti con la correzione relativa all'efficienza di clonaggio delle cellule.

1.5 Criteri qualitativi

Nessuno

1.6 Descrizione del metodo di saggio

Preparazioni

Cellule

Per il tipo di determinazione qui considerato è disponibile tutta una serie di linee cellulari. Esse comprendono dei subcloni di cellule L5178Y, CHO o di cellule V-79 delle quali sono state dimostrate la sensibilità agli agenti mutageni chimici, l'elevata efficienza di clonaggio e la bassa frequenza di mutazioni spontanee. Le cellule possono essere controllate periodicamente per quel che riguarda la stabilità del cariotipo, ed è comunque opportuno accertare l'assenza in esse di contaminazione da micoplasma. È possibile usare anche altri tipi di cellule, a condizione che ne sia pienamente documentata la validità per la determinazione delle mutazioni geniche indotte chimicamente.

⁽¹⁾ Già HGPRT

2. DATI

I dati devono essere presentati in forma di tabelle. Devono essere presentati i conteggi delle singole piastre, per la sostanza in esame e per il controllo, sia per l'induzione delle mutazioni che per la sopravvivenza. Devono altresì essere indicati il numero medio delle colonie per piastra e la deviazione standard. La frequenza delle mutazioni va espressa quale numero dei mutanti in relazione al numero delle cellule sopravvissute. La sopravvivenza e l'efficienza di clonaggio sono espresse in forma di percentuale del livello del controllo. I dati devono essere valutati secondo metodi statistici appropriati.

3. RELAZIONE**3.1. Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile:

- tipo di cellule usate, numero delle colture di cellule, metodi per il mantenimento delle colture di cellule,
- condizioni di effettuazione del test: composizione dei terreni, concentrazione di CO₂, concentrazione della sostanza in esame, solvente usato, temperatura di incubazione, tempo di incubazione, durata del periodo di espressione (se necessario, con indicazione del numero delle cellule seminate, delle subcolture e dello schema di mantenimento), durata del trattamento, densità delle cellule durante il trattamento, tipo di sistema di attivazione metabolica dei mammiferi usato, controlli positivi e negativi, agente selettivo usato,
- ragioni della selezione delle dosi,
- metodo usato per il conteggio delle cellule vitali e delle cellule mutanti,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

3.2. Valutazione ed interpretazione

Vedi introduzione generale, parte B.

4. RIFERIMENTI

Vedi introduzione generale, parte B.

3 RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile

- ceppo usato,
- condizioni di effettuazione del test: cellule in fase stazionaria o di crescita, composizione dei terreni, temperatura e durata dell'incubazione, sistemi di attivazione metabolica,
- condizioni del trattamento, concentrazione di esposizione, procedimento e durata del trattamento, temperatura di trattamento, controlli positivi e negativi,
- numero di colonie contate, numero dei ricombinanti, frequenza della sopravvivenza e della ricombinazione, relazione dose/risposta se possibile, valutazione statistica dei dati,
- discussione dei risultati,
- interpretazione dei risultati

3.2. Valutazione ed interpretazione

Vedi introduzione generale, parte B.

4 RIFERIMENTI

Vedi introduzione generale, parte B.

Terreni di coltura

E' necessario valersi di terreni di coltura e di condizioni di incubazione (temperatura, recipienti di coltura, concentrazioni di CO₂, umidità, ecc.) appropriati. I terreni e i sieri vanno scelti in relazione ai sistemi selettivi e al tipo di cellule usati nella determinazione.

Sostanza in esame

Le sostanze in esame possono essere preparate in terreni di coltura ovvero disciolte o poste in sospensione in veicoli appropriati prima del trattamento delle cellule. La concentrazione finale del veicolo nel sistema di coltura non deve influire sulla vitalità delle cellule o sul loro tasso di crescita.

Attivazione metabolica

E' opportuno esporre le cellule alla sostanza in esame sia in presenza che in assenza di un sistema esogeno di attivazione metabolica dei mammiferi. Alternativamente, quando si fa uso di tipi di cellule con attività metabolica endogena è opportuno che l'entità e la natura di detta attività siano conosciute come appropriate alla classe clinica che si sta esaminando.

Condizioni sperimentali

Uso di controlli positivi e negativi

E' opportuno includere in ciascun esperimento dei controlli positivi, valendosi sia di un composto ad azione diretta che di un composto per il quale occorre attivazione metabolica; è altresì opportuno effettuare un controllo negativo (del veicolo).

Quali esempi di sostanze che si prestano ad essere usate come controlli positivi si possono citare le seguenti:

- composti ad azione diretta:
 - etilmetansulfonato,
 - icantone,
- composti ad azione indiretta:
 - 2-acetilaminofluorene,
 - 7, 12-dimetilbenzantracene,
 - N-nitrosodimetilamina.

Se del caso, si può ancora aggiungere un ulteriore controllo positivo della medesima classe chimica della sostanza in esame.

Concentrazioni

E' opportuno fare uso di diverse concentrazioni della sostanza in esame. Dette concentrazioni devono produrre un effetto tossico proporzionale alle concentrazioni stesse, nel senso che la concentrazione più elevata dà luogo ad un livello ridotto di sopravvivenza, mentre alla concentrazione più bassa la sopravvivenza è approssimativamente dello stesso ordine che nel controllo negativo. Le sostanze relativamente insolubili in acqua vanno saggiate fino al loro limite di solubilità secondo procedure appropriate. Per le sostanze non tossiche completamente solubili in acqua la concentrazione più elevata della sostanza all'esame va determinata caso per caso.

Procedimento

Il numero delle cellule usate per le varie colture deve essere in relazione con la frequenza delle mutazioni spontanee; un criterio di carattere generale consiste nell'usare un numero di cellule vitali pari al decuplo dell'inverso delle frequenze delle mutazioni spontanee.

Le cellule vanno esposte all'effetto delle sostanze per una durata adeguata; nella maggior parte dei casi è efficace un'esposizione da 2 a 5 ore. Le cellule che non hanno un'attività metabolica endogena sufficiente devono di preferenza essere esposte alla sostanza in esame sia in presenza che in assenza di un appropriato sistema di attivazione metabolica. Al termine del periodo di esposizione le cellule vengono lavate da ogni traccia della sostanza in esame e poste in coltura per la determinazione dell'efficienza di clonaggio e per consentire l'espressione del fenotipo mutante.

Al termine del periodo di espressione, che deve essere sufficientemente lungo per rendere possibile un'espressione fenotipica pressoché ottimale dei mutanti indotti, le cellule vengono coltivate in un mezzo rispettivamente con e senza agenti selettivi per la determinazione del numero dei mutanti e dell'efficienza di clonaggio.

Tutti i risultati vengono confermati in un esperimento indipendente.

determinazioni autoradiografiche che per le determinazioni LSC effettuate senza attivazione metabolica e la 4-NQO (4-nitrochinolina N ossido), la N dimetilnitrosamina e a sua volta un esempio di composto per controllo positivo quando sia fatto uso di sistemi di attivazione metabolica

Concentrazioni

E opportuno fare uso di concentrazioni multiple della sostanza in esame in una gamma adeguata ai fini della determinazione della risposta. La concentrazione più elevata deve dar luogo a qualche effetto citotossico. I composti relativamente insolubili in acqua vanno saggiati fino al loro limite di solubilità. Per le sostanze non tossiche altamente solubili in acqua la concentrazione massima della sostanza in esame va determinata caso per caso.

Cellule

Per il mantenimento delle colture è opportuno fare uso di terreni di crescita, di concentrazioni di CO₂ e di condizioni di temperatura e di umidità appropriate. Le linee cellulari stabilizzate devono essere controllate periodicamente per escludere la presenza di contaminazione da micoplasma.

Attivazione metabolica

Con le colture primarie di epatociti non si fa uso di sistemi di attivazione metabolica. Le linee cellulari stabilizzate ed i linfociti vengono esposti alla sostanza in esame sia in presenza che in assenza di un sistema appropriato di attivazione metabolica.

Procedimento

Preparazione delle colture

Le linee cellulari stabilizzate vengono generate da coltura stock (ad esempio per tripsinizzazione o mediante separazione per scuotimento), seminate in recipienti di coltura a densità appropriata ed incubate a 37 °C.

Colture a breve termine di epatociti di ratto vengono preparate dando modo a epatociti dissociati di fresco in un terreno appropriato di attaccarsi alla superficie di crescita. Le colture di linfociti umani vengono preparate secondo tecniche appropriate.

Trattamento delle colture con la sostanza in esame

Epatociti primari di ratto

Gli epatociti di ratto isolati di fresco vengono trattati con la sostanza in esame in un terreno contenente ³H-TdR per una durata appropriata. Al termine del periodo di trattamento le cellule vanno tolte mediante filtraggio dal terreno, risciacquate, fissate ed essiccate. I vetrini vanno immersi in emulsione autoradiografica (alternativamente si possono usare pellicole adatte), esposti, sviluppati, colorati ed enumerati.

Linee cellulari stabilizzate e linfociti

Tecniche autoradiografiche. Le colture di cellule vengono esposte alla sostanza in esame per una durata appropriata e successivamente trattate con ³H-TdR. La durata sarà determinata dalla natura della sostanza, dall'attività del sistema metabolizzante e dal tipo delle cellule. Per rilevare il valore massimo di UDS, è opportuno aggiungere ³H-TdR contemporaneamente alla sostanza all'esame, ovvero entro pochi minuti dall'esposizione alla sostanza stessa. La scelta fra i suddetti due procedimenti sarà fatta in relazione alla possibilità di interazioni fra la sostanza all'esame e ³H-TdR.

Al fine di poter distinguere fra UDS e la replicazione semi conservativa di DNA si può inibire quest'ultima ad esempio facendo uso di un terreno deficiente di arginina, a basso contenuto di siero o con idrossurea nel mezzo di coltura.

Misure LSC di UDS. Prima del trattamento con la sostanza in esame è opportuno bloccare nel modo che si è descritto sopra l'entrata delle cellule nella fase S. Le cellule vengono poi esposte alla sostanza in esame nel modo che si è descritto per l'autoradiografia. Al termine del periodo di incubazione si estrae il DNA dalle cellule e si determinano il contenuto totale di DNA e la misura della incorporazione di ³H-TdR.

Occorre rilevare che quando si fa uso delle tecniche sopra descritte di linfociti umani, la soppressione della replicazione semi conservativa di DNA non è necessaria in colture non stimulate.

Esempi di controlli positivi per il test su epatociti di ratto sono il 7,12-DMBA (7,12-dimetilbenzotracene) e il 2-AAF (2-acetilaminofluorene). Nel caso delle linee cellulari stabilizzate un esempio di controllo positivo sia per le determinazioni autoradiografiche che per le determinazioni LSC effettuate senza attivazione metabolica è la 4-NQO (4-nitrochinolina-N-ossido); la N-dimetilnitrosamina è a sua volta un esempio di composto per controllo positivo quando sia fatto uso di sistemi di attivazione metabolica.

Concentrazioni

È opportuno fare uso di concentrazioni multiple della sostanza in esame in una gamma adeguata ai fini della determinazione della risposta. La concentrazione più elevata deve dar luogo a qualche effetto citotossico. I composti relativamente insolubili in acqua vanno saggiati fino al loro limite di solubilità. Per le sostanze non tossiche altamente solubili in acqua la concentrazione massima della sostanza in esame va determinata caso per caso.

Cellule

Per il mantenimento delle colture è opportuno fare uso di terreni di crescita, di concentrazioni di CO₂ e di condizioni di temperatura e di umidità appropriate. Le linee cellulari stabilizzate devono essere controllate periodicamente per escludere la presenza di contaminazione da micoplasma.

Attivazione metabolica

Con le colture primarie di epatociti non si fa uso di sistemi di attivazione metabolica. Le linee cellulari stabilizzate ed i linfociti vengono esposti alla sostanza in esame sia in presenza che in assenza di un sistema appropriato di attivazione metabolica.

Procedimento

Preparazione delle colture

Le linee cellulari stabilizzate vengono generate da coltura stock (ad esempio per tripsinizzazione o mediante separazione per scuotimento), seminate in recipienti di coltura a densità appropriata ed incubate a 37 °C.

Colture a breve termine di epatociti di ratto vengono preparate dando modo a epatociti dissociati di fresco in un terreno appropriato di attaccarsi alla superficie di crescita. Le colture di linfociti umani vengono preparate secondo tecniche appropriate.

Trattamento delle colture con la sostanza in esame

Epatociti primari di ratto

Gli epatociti di ratto isolati di fresco vengono trattati con la sostanza in esame in un terreno contenente ³H-TdR per una durata appropriata. Al termine del periodo di trattamento le cellule vanno tolte mediante filtraggio dal terreno, risciacquate, fissate ed essiccate. I vetrini vanno immersi in emulsione autoradiografica (alternativamente si possono usare pellicole adatte), esposti, sviluppati, colorati ed enumerati.

Linee cellulari stabilizzate e linfociti

Tecniche autoradiografiche: Le colture di cellule vengono esposte alla sostanza in esame per una durata appropriata e successivamente trattate con ³H-TdR. La durata sarà determinata dalla natura della sostanza, dall'attività del sistema metabolizzante e dal tipo delle cellule. Per rilevare il valore massimo di UDS, è opportuno aggiungere ³H-TdR contemporaneamente alla sostanza all'esame, ovvero entro pochi minuti dall'esposizione alla sostanza stessa. La scelta fra i suddetti due procedimenti sarà fatta in relazione alla possibilità di interazioni fra la sostanza all'esame e ³H-TdR.

Al fine di poter distinguere fra UDS e la replicazione semi-conservativa di DNA si può inibire quest'ultima, ad esempio facendo uso di un terreno deficiente di arginina, a basso contenuto di siero o con idrossiurea nel mezzo di coltura.

Misure LSC di UDS: Prima del trattamento con la sostanza in esame è opportuno bloccare nel modo che si è descritto sopra l'entrata delle cellule nella fase S. Le cellule vengono poi esposte alla sostanza in esame nel modo che si è descritto per l'autoradiografia. Al termine del periodo di incubazione si estrae il DNA dalle cellule e si determinano il contenuto totale di DNA e la misura della incorporazione di ³H-TdR.

Occorre rilevare che quando si fa uso delle tecniche sopra descritte di linfociti umani, la soppressione della replicazione semi-conservativa di DNA non è necessaria in colture non stimolate.

Analisi**Determinazioni autoradiografiche**

Nella determinazione di UDS nelle cellule in coltura non si contano i nuclei in fase S. È opportuno contare almeno 50 cellule per concentrazione. Le lastre vanno codificate prima del conteggio. È opportuno contare su ciascuna piastrina diversi campi a caso interamente separati tra loro. Per la determinazione della quantità di incorporazione di ^3H -TdR nel citoplasma è bene contare nel citoplasma di ciascuna cellula conteggiata tre aree delle dimensioni del nucleo.

Determinazioni LSC

Nelle determinazioni LSC UDS occorre fare uso di un numero adeguato di colture per ogni concentrazione e per i controlli.

Tutti i risultati dovrebbero essere confermati in un esperimento indipendente.

2 DATI

I dati devono essere presentati in forma di tabelle.

2.1 Determinazioni autoradiografiche

Della entità dell'incorporazione di ^3H -TdR nel citoplasma e del numero dei granuli osservati nel nucleo delle cellule va presa nota separatamente.

Per descrivere la distribuzione dell'entità dell'incorporazione di ^3H -TdR nel citoplasma e del numero dei granuli per nucleo può essere fatto riferimento alla media, alla mediana ed al modo.

2.2 Determinazioni LSC

Per le determinazioni LSC, l'incorporazione di ^3H -TdR va indicata in termini di dpm/ μg di DNA. Il valore medio di dpm/ μg di DNA con la deviazione standard può essere usato per descrivere la distribuzione della incorporazione.

I dati devono essere valutati secondo metodi statistici appropriati.

3 RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile:

- cellule usate, densità e numero dei passaggi al momento del trattamento, numero delle colture di cellule,
- metodi usati per il mantenimento delle colture di cellule, con indicazione del terreno, della temperatura e della concentrazione di CO_2 ,
- sostanza in esame, veicolo, concentrazioni e ragioni della scelta delle concentrazioni usate nella determinazione,
- dettagli riguardanti i sistemi di attivazione metabolica,
- programmi di trattamento,
- controlli positivi e negativi,

- tecnica autoradiografica usata,
- procedimenti usati per bloccare l'entrata delle cellule nella fase S,
- procedimenti usati per l'estrazione di DNA e per la determinazione del contenuto totale di DNA nelle determinazioni LSC,
- relazione dose-risposta se del caso,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

B.19. SAGGIO DEGLI SCAMBI TRA CROMATIDI FRATELLI IN VITRO

1 METODO

1.1 Introduzione

Vedi introduzione generale, parte B

1.2 Definizioni

Vedi introduzione generale, parte B

1.3 Sostanze di riferimento

Nessuna

1.4 Principi del metodo di saggio

Quello degli scambi tra cromatidi fratelli — Sister chromatid exchange (SEC) — è un test a breve termine per la rilevazione degli scambi reciproci di DNA fra due cromatidi fratelli di un cromosoma in duplicazione. Gli SCE rappresentano l'interscambio di prodotti della replicazione di DNA in corrispondenza di loci apparentemente omologhi. Il processo di scambio comporta presumibilmente la rottura e la riunione di DNA, ma sulla sua base molecolare non si conosce in realtà molto. La rilevazione degli SCE richiede qualche mezzo per marcare in modo differenziale i cromatidi fratelli, e questo può essere ottenuto mediante incorporazione di bromodeossiridina (BrdU) nel DNA cromosomico per due cicli cellulari.

Culture in vitro di cellule di mammiferi vengono esposte alla sostanza in esame con e senza un sistema esogeno di attivazione metabolica dei mammiferi, se appropriato, e poste in coltura per due cicli di replicazione in terreno contenente BrdU. Dopo un trattamento con un inibitore del fuso (ad esempio la colchicina) per accumulare cellule in uno stadio di mitosi di tipo metafase (c-metafase), le cellule vengono raccolte e si procede alle preparazioni cromosomiche.

1.5 Criteri qualitativi

Nessuno

1.6 Descrizione del metodo di saggio

Preparazioni

- Nel saggio si possono usare colture primarie (linfociti umani) o linee cellulari stabilizzate (ad esempio cellule di ovario di hamster cinese). Le linee cellulari devono essere controllate per escludere la presenza di contaminazione da Mycoplasma.
- Vanno usati terreni di coltura e condizioni di incubazione (temperatura, recipienti di coltura, concentrazione di CO₂ ed umidità) appropriati.
- Le sostanze in esame possono essere preparate in terreni di coltura ovvero disciolte o poste in sospensione in veicoli appropriati prima del trattamento delle cellule. La concentrazione finale dei veicoli nei sistemi di coltura non deve influire in maniera significativa sulla vitalità o sul tasso di crescita delle cellule, ed è parallelamente opportuno verificare la frequenza degli SCE per mezzo di un controllo con solvente.
- È opportuno esporre le cellule alla sostanza in esame sia in presenza che in assenza di un sistema esogeno di attivazione metabolica di mammiferi. Alternativamente, ove si faccia uso di tipi di cellule con attività metabolica endogena, l'intensità e la natura dell'attività devono essere appropriate per la classe chimica sottoposta all'esame.

*Condizioni sperimentali**Numero di colture*

Per ciascun punto sperimentale dovrebbero essere usate colture almeno in duplicato.

Uso di controlli positivi e negativi

È opportuno includere in ciascun esperimento dei controlli positivi, facendo uso sia di un composto ad azione diretta che di un composto richiedente attivazione metabolica, ed è opportuno anche effettuare un controllo del veicolo.

Quali esempi di sostanze che si prestano ad essere usate come controlli positivi si possono citare:

- come composto ad azione diretta:
 - l'etilmetansulfonato,
- come composto ad azione indiretta:
 - la ciclofosfamide.

Se del caso, può essere incluso nell'esperimento un controllo positivo supplementare della medesima classe chimica della sostanza in esame.

Concentrazioni

È opportuno fare uso di almeno tre concentrazioni adeguatamente intervallate della sostanza in esame. La concentrazione più elevata deve dar luogo ad un effetto tossico significativo, ma deve ancora consentire il verificarsi di una replicazione adeguata delle cellule. Le sostanze relativamente insolubili in acqua vanno saggiate fino al loro limite di solubilità secondo procedimenti appropriati. Per le sostanze non tossiche altamente solubili in acqua la concentrazione massima della sostanza in esame va determinata caso per caso.

Procedimento

Preparazione delle colture

Linee cellulari stabilizzate vengono generate da colture stock (ad esempio per tripsinizzazione o mediante distacco per scuotimento), seminate in recipienti di coltura a densità appropriata ed incubate a 37 °C. Nel caso di coltura monostrato, il numero delle cellule per ogni recipiente di coltura va regolato in modo che le colture non siano confluenti in misura molto maggiore del 50 % al momento della raccolta. Alternativamente, le cellule possono essere usate in forma di coltura in sospensione. Le colture di linfociti umani sono ottenute da sangue eparinizzato secondo tecniche appropriate ed incubate a 37 °C.

Trattamento

Vengono esposte alla sostanza in esame per una durata adeguata cellule in uno stadio di crescita esponenziale; nella maggior parte dei casi può essere efficace una durata da una a due ore, ma la durata del trattamento può in taluni casi essere prolungata fino a due cicli cellulari completi. Le cellule non aventi una sufficiente attività metabolica endogena vanno esposte alla sostanza in esame sia in presenza che in assenza di un sistema appropriato di attivazione metabolica. Al termine del periodo di esposizione le cellule vengono lavate da ogni traccia della sostanza in esame e coltivate per due cicli di replicazione in presenza di BrdU. In un procedimento alternativo si possono esporre le cellule contemporaneamente alla sostanza in esame e al BrdU per la durata completa di coltura di due cicli cellulari. Le colture di linfociti umani vengono trattate mentre si trovano in condizione semisincrona. Le cellule vengono analizzate alle loro seconda divisione dopo il trattamento, per assicurarsi che siano state esposte alla sostanza negli stadi più sensibili del ciclo cellulare. Tutte le colture alle quali si aggiunge BrdU, vanno manipolate nell'oscurità o in luce attenuata di lampade ad incandescenza fino al momento della raccolta delle cellule, allo scopo di ridurre per quanto possibile la fotolisi del DNA contenente BrdU.

Raccolta delle cellule

Le colture di cellule vengono trattate con un inibitore del fuso (ad esempio colchicina) da 1 a 4 ore prima della raccolta. Ciascuna coltura viene raccolta e trattata separatamente per la preparazione dei cromosomi.

Preparazione e colorazione dei cromosomi

I preparati di cromosomi vengono ottenuti secondo le tecniche citogenetiche correnti. La colorazione dei vetrini per l'evidenziazione degli SCE può essere effettuata secondo diverse tecniche (ad esempio con il metodo della fluorescenza più Giemsa).

Analisi

Il numero di cellule analizzate deve essere basato sulla frequenza spontanea di controllo degli SCE. Normalmente si analizzano per gli SCE almeno 25 metafasi ben spaziate per coltura. I vetrini vengono codificati prima dell'analisi. Nei linfociti umani si analizzano soltanto metafasi contenenti 46 centromeri. Nelle linee cellulari stabilizzate si analizzano a loro volta soltanto metafasi contenenti ± 2 centromeri del numero modale. È opportuno indicare se il salto di marcatura a livello del centromero viene o non viene conteggiato come SCE. I risultati dovrebbero essere confermati in un esperimento indipendente.

2. DATI

I dati devono essere presentati in forma di tabelle. Il numero degli SCE per metafase e il numero degli SCE per cromosoma vanno indicati separatamente per tutte le colture trattate e quelle di controllo. I dati devono essere definiti secondo metodi statistici appropriati.

3. RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile:

- cellule usate, metodi di mantenimento della coltura cellulare,
- condizioni sperimentali: composizione dei mezzi, concentrazione di CO_2 , concentrazione della sostanza all'esame, veicolo usato, temperatura di incubazione, tempo di trattamento, inibitore del fuso usato, sua concentrazione e durata del trattamento connesso, tipo di sistema di attivazione di mammiferi usato, controlli positivi e negativi,
- numero di colture di cellule per punto sperimentale,
- dettagli della tecnica usata per la preparazione delle lastre,
- numero delle metafasi analizzate (indicazione separata dei dati per ciascuna coltura),
- numero medio di SCE per cellula e per cromosoma (indicazione separata dei dati per ciascuna coltura),
- criteri per il riscontro degli SCE,
- criteri di selezione delle dosi,
- relazione dose/risposta se del caso,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

B.20. SAGGIO DEI LETALI RECESSIVI LEGATI AL SESSO: DROSOPHILA MELANOGASTER

I METODO

1.1 Introduzione

Vedi introduzione generale, parte B.

1.2 Definizioni

Vedi introduzione generale, parte B.

1.3 Sostanze di riferimento

Nessuna.

1.4 Principi del metodo di saggio

Il saggio dei letali recessivi legati al sesso — sex-linked recessive lethal (SLRL) — nel quale è fatto uso della *Drosophila melanogaster*, permette di rilevare l'induzione sia di mutazioni puntiformi che di piccole delezioni nella linea germinale dell'insetto. Si tratta di un saggio capace di rivelare mutazioni in circa 800 loci sul cromosoma X; questa cifra rappresenta circa l'80 % di tutti i loci del cromosoma X; quest'ultimo rappresenta a sua volta circa un quinto dell'intero genoma aploide.

Le mutazioni nel cromosoma X nella *D. melanogaster* sono espresse fenotipicamente nei maschi portanti il gene mutante. Quando la mutazione è letale nella condizione emizigote, la sua presenza si desume dall'assenza di una delle due classi di discendenza maschile che sono normalmente prodotte da una femmina eterozigote. Il saggio SLRL si basa sulla disponibilità di cromosomi specificamente marcati.

1.5 Criteri qualitativi

Nessuno.

1.6 Descrizione del metodo di saggio

*Preparazioni**Ceppi*

Possono essere usati maschi di un ceppo ben definito di tipo selvatico e femmine del ceppo Muller-5. Possono altresì essere usati altri ceppi di femmine marcate in modo appropriato con cromosomi X multipli invertiti.

Sostanza in esame

Le sostanze in esame vanno disciolte in acqua. Le sostanze non solubili in acqua possono essere disciolte o poste in sospensione in solventi appropriati (ad esempio una miscela di etanolo e Tween-60 o 80), e successivamente diluite in acqua o in soluzione salina prima della somministrazione. È opportuno evitare quale solvente il dimetilsolfossido (DMSO).

Numero di animali

Il saggio va programmato con una sensibilità ed una potenza predeterminati. Sul numero di cromosomi trattati che devono essere analizzati influirà fortemente la frequenza delle mutazioni spontanee osservata nel controllo appropriato.

Vie di somministrazione

L'esposizione può essere orale, per iniezione o per esposizione a gas o a vapori. La somministrazione della sostanza in esame può essere fatta in forma di soluzione zuccherina. Se necessario, le sostanze possono essere disciolte in soluzione di NaCl allo 0,7 % ed iniettate nel torace o nell'addome.

Uso di controlli negativi e positivi

È opportuno includere nell'esperimento controlli negativi (del solvente) e positivi. Ove tuttavia siano disponibili appropriati dati storici di controllo del laboratorio, non sono necessari controlli concomitanti.

Concentrazioni

È opportuno fare uso di tre concentrazioni. Per una valutazione preliminare può essere fatto uso di una sola concentrazione della sostanza in esame, che può essere quella massima tollerata o quella che dà luogo ad una qualche indicazione di tossicità. Per le sostanze non tossiche è opportuno adottare l'esposizione alla concentrazione massima praticabile.

Procedimento

Maschi di tipo selvatico (di età da 3 a 5 giorni) vengono trattati con la sostanza in esame e accoppiati individualmente con un numero maggiore di femmine vergini dello stock Muller-5 o di altro stock marcato in maniera appropriata (con cromosomi X multipli invertiti). Le femmine vengono sostituite con vergini fresche ogni due, tre giorni così da coprire l'intero ciclo delle cellule germinali. Sulla prole di dette femmine viene effettuata l'analisi degli effetti letali corrispondenti agli effetti sullo sperma maturo, sugli spermatozoi di stadio medio o avanzato, sugli spermatozoi precoci, sugli spermatozoi e sugli spermatogoni al momento del trattamento.

Le femmine eterozigoti F_1 degli incroci di cui sopra sono fatte accoppiare individualmente (ossia in ragione di una femmina per bottiglietta) con i loro fratelli. Nella generazione F_2 si procede su ciascuna coltura all'analisi dell'assenza di maschi del tipo selvatico. Se da una femmina F_1 appare essere derivata una coltura portante un letale nel cromosoma X dei genitori (ossia se non si osservano maschi con il cromosoma trattato) si devono mettere alla prova figlie di quella femmina con il medesimo genotipo per stabilire se la letalità si ripete nella generazione successiva.

2

DATI

I dati devono essere disposti in forma di tabelle con indicazione del numero dei cromosomi X saggiati, del numero dei maschi non fertili e del numero dei cromosomi letali per ciascuna concentrazione di esposizione e per ciascun periodo di accoppiamento per i singoli maschi trattati. Deve essere riportato per ciascun maschio il numero degli aggregati di differenti dimensioni. I risultati del test devono essere confermati in un esperimento a parte.

Per la valutazione del saggio dei letali recessivi legati al sesso deve essere fatto uso di metodi statistici appropriati. L'agglomerazione di letali recessivi aventi origine da un medesimo maschio dev'essere considerata e valutata secondo criteri statistici appropriati.

3

RELAZIONE

3.1

Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- stock, stock o ceppi di *Drosophila* usati, età degli insetti, numero dei maschi trattati, numero dei maschi sterili, numero di colture F_1 costituite, numero di colture F_2 senza prole, numero di cromosomi portanti un letale individuati per ciascuno stadio delle cellule germinali,
- criteri per la definizione delle dimensioni dei gruppi trattati,
- condizioni di effettuazione del saggio: descrizione dettagliata dei programmi di trattamento e di campionatura, livelli di esposizione, dati della tossicità, controlli negativi (del solvente) e positivi, se del caso,
- criteri per il riscontro delle mutazioni letali,
- relazione esposizione/effetto se del caso,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

B.21. SAGGIO IN VITRO DI TRASFORMAZIONE DI CELLULE DI MAMMIFERO

1 METODO

1.1 Introduzione

Vedi introduzione generale, parte B.

1.2 Definizioni

Vedi introduzione generale, parte B.

1.3 Sostanze di riferimento

Nessuna.

1.4 Principi del metodo di saggio

Per la rilevazione di cambiamenti fenotipici in vitro indotti da sostanze chimiche associate con una trasformazione maligna in vivo può essere fatto uso di sistemi di coltura di cellule di mammiferi. Fra le cellule più largamente usate figurano le cellule C3H10T $\frac{1}{2}$, 3T3, SHE, le cellule di ratto Fisher; i saggi si fondano su cambiamenti della morfologia cellulare, sulla formazione di foci e sulla perdita della dipendenza da ancoraggio in agar semisolido. Esistono anche altri sistemi meno largamente usati i quali mettono in luce altri tipi di cambiamenti fisiologici o morfologici nelle cellule successivamente all'esposizione a sostanze chimiche carcinogene. Nessuno degli eventi finali dei test in vitro ha un legame meccanicistico accertato con il cancro. Alcuni fra i saggi sono in grado di evidenziare agenti promotori dei tumori. La citotossicità può essere determinata attraverso la misura dell'effetto della sostanza in esame sulla capacità di formazione di colonie (efficienza di clonaggio) o sul tasso di crescita delle colture. La misurazione della citotossicità ha lo scopo di stabilire se l'esposizione alla sostanza in esame abbia avuto carattere rilevante dal punto di vista tossicologico, ma non può essere usata per calcolare la frequenza della trasformazione in tutti i saggi poiché alcuni di essi possono comportare un'incubazione prolungata e/o un ripiastramento delle cellule.

1.5 Criteri qualitativi

Nessuno.

1.6 Descrizione del metodo di saggio

*Preparazioni**Cellule*

È disponibile tutta una varietà di linee cellulari o di cellule primarie, in relazione al saggio di trasformazione che si intende effettuare. Il ricercatore deve accertarsi che nel saggio che si sta effettuando le cellule presentino dopo esposizione a carcinogeni noti l'appropriato cambiamento fenotipico, e che il saggio nel suo laboratorio sia di provata e documentata validità e attendibilità.

Terreni di coltura

Devono essere usati terreni di coltura e condizioni sperimentali appropriati per il saggio di trasformazione che si effettua.

Sostanza in esame

Le sostanze in esame possono essere preparate in mezzi di coltura ovvero disciolte o poste in sospensione in veicoli appropriati, prima del trattamento delle cellule. La concentrazione finale del veicolo nel sistema di coltura non deve influire sulla vitalità o sul tasso di crescita delle cellule né sull'incidenza della trasformazione.

Attivazione metabolica

Le cellule vanno esposte alla sostanza in esame sia in presenza che in assenza di un sistema esogeno di attivazione metabolica dei mammiferi. Alternativamente, quando sia fatto uso di tipi di cellule che possiedono un'attività metabolica endogena deve essere accertato che la natura dell'attività stessa sia appropriata per la classe chimica sottoposta all'esame.

*Condizioni sperimentali**Uso di controlli positivi e negativi*

È opportuno includere in ciascun esperimento dei controlli positivi, con impiego sia di un composto ad azione diretta che di un composto richiedente attivazione metabolica, e altresì opportuno fare uso di un controllo negativo (del solvente)

Quali esempi di sostanze che si prestano ad essere usate come controlli positivi si possono citare

- sostanze ad azione diretta
 - etilmetansulfonato,
 - β -propiolattone,
- composti richiedenti un'attivazione metabolica
 - 2-acetilaminofluorene,
 - 4-dimetilaminoazobenzene,
 - 7,12-dimetilbenzantracene

Se del caso, è opportuno includere un controllo positivo supplementare della medesima classe chimica del composto in esame

Concentrazioni

È opportuno usare varie concentrazioni della sostanza in esame. Dette concentrazioni devono dar luogo ad un effetto tossico correlato con la concentrazione, nel senso che la concentrazione più elevata produce un livello ridotto di sopravvivenza, mentre alla concentrazione più bassa la sopravvivenza è approssimativamente dello stesso ordine che nel controllo negativo. Le sostanze relativamente insolubili in acqua vanno saggate fino al loro limite di solubilità secondo procedure appropriate. Per le sostanze non tossiche altamente solubili in acqua la concentrazione massima della sostanza va determinata caso per caso.

Procedimento

L'esposizione delle cellule deve avere una durata appropriata in relazione al sistema di saggio adottato, e questo, quando l'esposizione è prolungata, può comportare un ridosaggio con cambio del mezzo e, se necessario, con miscela di attivazione metabolica fresca. Le cellule non aventi un'attività metabolica endogena sufficiente vanno esposte alla sostanza in esame sia in presenza che in assenza di un sistema di attivazione metabolica appropriato. Al termine del periodo di esposizione le cellule vengono lavate da ogni traccia della sostanza in esame e coltivate in condizioni appropriate per la comparsa del fenotipo trasformato che si sta studiando, e viene infine determinata l'incidenza della trasformazione. Tutti i risultati devono essere confermati in un esperimento indipendente.

2 DATI

I dati vanno presentati in forma di tabella e possono assumere forme diverse a seconda del tipo di determinazione effettuato, ad esempio numero di foci o di colonie per piastre, piastre positive o numero delle cellule trasformate. La sopravvivenza va espressa quale percentuale dei livelli di controllo, e la frequenza della trasformazione sotto forma del numero di trasformanti in relazione al numero dei sopravvissuti. I dati devono essere valutati secondo metodi statistici appropriati.

3 RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile

- tipo di cellule usato, numero delle colture cellulari, metodi di mantenimento delle colture,
- condizioni di effettuazione del saggio, concentrazione della sostanza in esame, veicolo usato, temperatura di incubazione, durata dell'incubazione, durata e frequenza del trattamento, densità delle cellule durante il trattamento, tipo di sistema di attivazione metabolica esogena usato, controlli positivi e negativi, specificazione del fenotipo studiato, sistema selettivo usato (se del caso), criteri per la scelta delle dosi,

- metodo seguito per l'enumerazione delle cellule vitali e delle cellule trasformate,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

3.2 **Valutazione ed interpretazione**

Vedi introduzione generale, parte B.

4 **RIFERIMENTI**

Vedi introduzione generale, parte B.

B.22. SAGGIO DEI LETALI DOMINANTI NEI RODITORI

1 METODO

1.1 Introduzione

Vedi introduzione generale, parte B

1.2 Definizioni

Vedi introduzione generale, parte B

1.3 Sostanze di riferimento

Nessuna

1.4 Principi del metodo di saggio

Gli effetti dei letali dominanti provocano la morte dell'embrione o del feto. L'induzione di letali dominanti per effetto dell'esposizione ad una sostanza chimica indica che la sostanza in causa ha attaccato il tessuto germinale della specie all'esame. È generalmente ammesso che i letali dominanti sono dovuti a un danno cromosomico (anomalie strutturali e numeriche). La morte dell'embrione in femmine trattate può altresì essere il risultato di effetti tossici.

Come criterio generale si espongono animali maschi al composto in esame e si accoppiano i medesimi con femmine vergini non trattate. I diversi stadi delle cellule germinali possono essere saggiati separatamente mediante l'osservanza di intervalli in successione negli accoppiamenti. L'aumento degli impianti morti per femmina nel gruppo trattato in confronto con gli impianti morti per femmina nel gruppo di controllo rispecchia la perdita successiva all'impianto. La perdita anteriore all'impianto può essere stimata sulla base di conteggi dei corpi lutei oppure attraverso il raffronto del totale degli impianti per femmina nel gruppo trattato e in quello di controllo. L'effetto letale dominante complessivo è rappresentato dalla somma della perdita anteriore e successiva all'impianto. Il calcolo dell'effetto letale dominante complessivo si basa sul raffronto fra gli impianti vivi per femmina nel gruppo trattato e gli impianti vivi per femmina nel gruppo di controllo. Una riduzione del numero di impianti a determinati intervalli può essere il risultato dell'uccisione di cellule (vale a dire, di spermatoцитi e/o di spermatogoni).

1.5 Criteri qualitativi

Nessuno.

1.6 Descrizione del metodo di saggio

Preparazioni

In tutti i casi in cui ciò sia possibile, le sostanze in esame vanno disciolte o poste in sospensione in soluzione salina isotonica. Le sostanze non solubili in acqua possono essere disciolte o sospese in solventi appropriati. Il solvente usato non deve né interferire con la sostanza in esame né produrre effetti tossici. È opportuno fare uso di preparazioni fresche della sostanza in esame.

*Condizioni sperimentali**Vie di somministrazione*

Il composto in esame va in generale somministrato una sola volta. Sulla base di informazioni tossicologiche può essere adottato un programma di trattamento ripetuto. Le vie di somministrazione correnti sono l'intubazione orale e l'iniezione intraperitoneale. Possono altresì essere appropriate altre vie di somministrazione.

Animali da esperimento

Quali specie da sottoporre al saggio sono raccomandati i ratti o i topi. Animali sani nella piena maturità sessuale vengono randomizzati ed assegnati al gruppo per il trattamento e al gruppo di controllo.

Numero e sesso

Occorre fare uso di un numero adeguato di maschi trattati in modo da tener conto della variazione spontanea del carattere biologico di cui si effettua la valutazione. Il numero scelto deve essere basato sulla sensibilità di rilevazione e sul valore di significatività determinati in precedenza. Ad esempio, in un esperimento tipico, il numero dei maschi per ciascun gruppo/dose deve essere sufficiente per dare da 30 a 50 femmine gravide per ogni intervallo di accoppiamento.

Uso di controlli negativi e positivi

È opportuno in linea generale includere in ciascun esperimento dei controlli simultanei positivi e negativi (del veicolo). Quando siano disponibili risultati accettabili di controlli positivi relativi ad esperimenti effettuati di recente nel medesimo laboratorio, al posto di un controllo positivo simultaneo può essere fatto uso di detti risultati.

Le sostanze per i controlli positivi vanno usate a dosi opportunamente basse (ad esempio MMS, intraperitoneale, a 10 mg/kg) allo scopo di dimostrare la sensibilità del saggio.

Livelli delle dosi

Di norma va fatto uso di tre livelli di dosaggio. La dose più alta deve produrre segni di tossicità o di riduzione della fertilità negli animali trattati. In taluni casi può essere sufficiente un solo livello elevato di dosaggio.

Saggio del limite

Le sostanze non tossiche vanno saggate a 5 g/kg con una sola somministrazione o a 1 g/kg/giorno con somministrazione ripetuta.

Procedimento

Sono possibili vari schemi di trattamento. Il tipo di trattamento più largamente usato è quello della somministrazione singola della sostanza in esame. Possono essere applicati anche altri schemi di trattamento.

I singoli maschi vengono accoppiati in successione con una o due femmine vergini non trattate ad intervalli appropriati dopo il trattamento. Le femmine vanno lasciate con i maschi almeno per la durata di un ciclo di estro o fino a che sia avvenuto l'accoppiamento, da determinare in base alla presenza di sperma nella vagina o di un tappo vaginale.

Il numero degli accoppiamenti successivi al trattamento è determinato in base al programma di trattamento e deve essere tale che vengano esaminati dopo il trattamento tutti gli stadi delle cellule germinali.

Le femmine vengono sacrificate nella seconda metà del periodo di gravidanza, e si procede all'esame del contenuto uterino per la determinazione del numero degli impianti morti e viventi. Si possono anche esaminare le ovaie per determinare il numero dei corpi lutei.

DATI

I dati devono essere disposti in forma di tabelle con indicazione del numero dei maschi, del numero delle femmine gravide e del numero delle femmine non gravide. I risultati di ciascun accoppiamento, con indicazione dell'identità dei singoli soggetti maschi e femmine, vanno riportati individualmente. Per ciascuna femmina va indicata la settimana di accoppiamento, e per i maschi il livello di dosaggio, nonché rispettivamente le frequenze degli impianti vivi e degli impianti morti. Il calcolo dell'effetto complessivo letale dominante si basa sul raffronto fra gli impianti vivi per femmina nel gruppo sottoposto al saggio e gli impianti vivi per femmina nel gruppo di controllo. Il rapporto fra gli impianti morti e quelli vivi del gruppo trattato posto a raffronto con il rapporto corrispondente del gruppo di controllo viene analizzato ai fini dell'indicazione della perdita successiva all'impianto.

Se i dati sono registrati come morti precoci e morti tardive, ciò deve risultare dalle tabelle. Se la perdita anteriore all'impiantazione è stimata, ne deve essere dato ragguaglio. La perdita anteriore all'impianto può essere calcolata come discrepanza fra il numero dei corpi lutei e il numero degli impianti, ovvero come riduzione del numero medio di impianti per utero in confronto con gli accoppiamenti di controllo. I dati vengono valutati secondo metodi statistici appropriati.

3. RELAZIONE

3.1. Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, età e peso degli animali usati, numero degli animali dell'uno e dell'altro sesso nei gruppi sottoposti al saggio e nei gruppi di controllo,
- sostanza in esame, solvente, livelli di dosaggio saggiati e ragioni della scelta delle dosi, controlli negativi e positivi, dati della tossicità,
- via e durata dell'esposizione,
- ordine degli accoppiamenti,
- metodo usato per stabilire l'avvenuto accoppiamento,
- metodo del sacrificio,
- criteri per l'analisi dei letali dominanti,
- relazione dose/risposta, se del caso,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

1.3 Sostanze di riferimento

Nessuna.

1.4 Principi del metodo di saggio

Il saggio dell'analisi citogenetica in vivo qui considerato permette di rilevare aberrazioni strutturali dei cromosomi negli spermatogoni. Esso consiste in un'analisi delle mitosi degli spermatogoni per aberrazioni di tipo cromatidico e di tipo cromosomico.

Il saggio fa uso di preparati di testicoli di mammiferi esposti alle sostanze in esame per vie appropriate e sacrificati ad intervalli diversi. Prima di essere sacrificati gli animali sono altresì trattati con inibitori del fuso quali la colchicina in modo da far accumulare cellule ad uno stadio della mitosi di tipo metafase (c-metafase). Si producono preparati cromosomici essiccati all'aria, che vengono colorati ed analizzati al microscopio.

Utili informazioni supplementari possono essere fornite dall'analisi degli spermatociti allo stadio di diacinesi/metafase I per formazioni multivalenti da traslocazione dopo trattamento delle cellule staminali.

1.5 Criteri qualitativi

Nessuno.

1.6 Descrizione del metodo di saggio

Preparazioni

Le sostanze in esame vengono disciolte in soluzione salina isotonica. Le sostanze non solubili vengono disciolte o poste in sospensione in un solvente appropriato. Si devono usare soluzioni del composto in esame preparate di fresco. Se si fa uso di un solvente per facilitare il dosaggio, esso non deve interferire con la sostanza in esame né produrre effetti tossici.

Vie di somministrazione

I composti in esame vanno in genere somministrati una sola volta. Sulla base di informazioni tossicologiche può essere adottato un programma di trattamento ripetuto. Il trattamento ripetuto può tuttavia essere applicato soltanto se il composto in esame non presenta effetti citotossici nella differenziazione degli spermatogoni.

Le vie di somministrazione correnti sono la via orale e l'iniezione intraperitoneale. Possono altresì essere appropriate altre vie di somministrazione.

Animali da esperimento

E per lo più fatto uso di topi e di hamster cinesi. Può tuttavia essere impiegata qualsiasi altra specie di mammiferi.

Vengono utilizzati maschi sessualmente maturi, che sono assegnati a caso ai gruppi per il trattamento ed ai gruppi di controllo.

Numero degli animali

Si devono usare almeno 5 maschi per ciascun gruppo trattato e per ciascun gruppo di controllo

Uso di controlli negativi e positivi

In linea generale è opportuno includere in ciascun esperimento dei controlli simultanei positivi e negativi (del solvente)

Le sostanze per i controlli positivi vanno usate in dose opportunamente bassa (ad esempio la mitomicina C, intraperitoneale, a 0,3 mg/kg) in modo da dimostrare la sensibilità del saggio

Livelli di dose

Si fa uso di una sola dose del composto in esame, scegliendo a questo fine la dose massima tollerata ovvero quella che produce qualche indicazione di citotossicità. Se la dose iniziale uccide un gran numero di cellule, si deve usare una seconda dose più bassa che presenti citotossicità. Nei casi in cui è necessario stabilire una relazione dose/risposta, sono richieste almeno tre dosi (ad esempio per confermare una risposta positiva debole). Le sostanze non tossiche vanno saggiate alla dose praticabile più elevata sia per la somministrazione singola che per la somministrazione ripetuta

Procedimento

Gli animali vengono in generale trattati con il composto in esame un'unica volta. Per il gruppo con la dose più elevata sono usati tre intervalli di campionamento dopo il trattamento. L'intervallo per il campionamento centrale è di 24 ore. Poiché il composto in esame può influire sulla cinetica del ciclo cellulare, si applicano un primo intervallo per la campionatura ed uno successivo adeguatamente spaziatosi in un lasso di tempo da 6 a 48 ore. Per i livelli di dosaggio supplementari i campioni vanno presi all'intervallo specificamente sensibile ovvero, quando questo non sia noto, 24 ore dopo il trattamento

Nel caso di un programma di trattamento ripetuto, può essere fatto uso di dosaggi ripetuti, e in tal caso i campioni vanno presi da 6 a 24 ore dopo l'ultimo trattamento. Un singolo tempo di campionamento può essere usato se giustificato scientificamente

Preparazione del testicolo

Per l'analisi della mitosi degli spermatogoni si inietta agli animali per via intraperitoneale una dose adeguata di un inibitore del fuso come la colchicina. Gli animali vengono poi sacrificati ad un intervallo appropriato dopo il trattamento. Per i topi detto intervallo varia da 3 a 5 ore, mentre per gli hamster cinesi possono essere necessarie più di 5 ore

È fatto uso della tecnica di essiccazione all'aria. Per specie diverse possono rendersi necessarie modifiche del procedimento standard. Si ottengono sospensioni di cellule che vengono trattate con soluzione ipotonica e fissate. Le cellule vengono stese su vetrini e colorate. I vetrini vengono codificati prima dell'analisi microscopica

Analisi

Per la ricerca delle aberrazioni strutturali dei cromosomi si analizzano almeno 100 metafasi mitotiche largamente disperse con il numero completo di centromeri. In aggiunta a ciò si può determinare il rapporto fra le mitosi degli spermatogoni e la prima e la seconda metafase meiotica in un campione complessivo di 100 cellule in divisione per animale per mettere in luce un eventuale effetto citotossico

2

DATI

I dati vengono presentati in forma di tabelle. Per ogni animale trattato e di controllo tutti i tipi di aberrazioni vengono elencati separatamente. È inclusa l'indicazione del numero totale di cellule analizzate e del numero totale di cellule aberranti per gruppo. Vengono date per tutti i parametri le medie e la deviazione standard. Si riporta infine in forma di tabelle il rapporto medio fra la mitosi degli spermatogoni e la prima e la seconda metafase meiotica per ciascun gruppo trattato e ciascun gruppo di controllo. I dati vengono valutati secondo metodi statistici appropriati

3 RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile:

- specie e ceppo di animali maschi, età e peso degli animali,
- numero di animali per ciascun gruppo trattato e ciascun gruppo di controllo,
- condizione di effettuazione del saggio, descrizione particolareggiata del trattamento, livelli di dosaggio, solventi, inibitore del fuso usato,
- numero delle cellule analizzate per animale in ciascun gruppo,
- tipi e numero di aberrazioni separatamente per ciascun animale trattato e ciascun animale di controllo,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

1.2 Definizioni

Vedi introduzione generale, parte B

1.3 Sostanze di riferimento

Nessuna

1.4 Principi del metodo di saggio

Quello qui considerato è un saggio in vivo nei topi, nel quale vengono esposti alle sostanze chimiche degli embrioni in corso di sviluppo. Le cellule bersaglio negli embrioni in corso di sviluppo sono i melanoblasti e i geni-bersaglio sono quelli che governano la pigmentazione del pelame dell'animale. Gli embrioni in corso di sviluppo sono eterozigoti per una serie di detti geni della colorazione del mantello. Una mutazione nell'allele dominante di un gene di questo tipo in un melanoblasto, o la sua perdita (tramite diversi eventi genetici) ha come risultato l'espressione del fenotipo recessivo nelle sue cellule discendenti, costituita da una macchia di colore cambiato nel mantello del topo risultante. Si riporta quindi il numero della prole con dette macchie o mutazioni, e se ne raffronta la frequenza con quella riscontrata nella prole risultante da embrioni trattati soltanto con il solvente. Il saggio delle macchie (Spot test) nei topi rivela presunte mutazioni somatiche nelle cellule fetali.

1.5 Criteri qualitativi

Nessuno

1.6 Descrizione del metodo di saggio

Preparazioni

Quando ciò è possibile, le sostanze in esame vengono disciolte o poste in sospensione in soluzione salina isotonica. Le sostanze non solubili in acqua vengono disciolte o poste in sospensione in solventi appropriati. Il solvente usato non deve interferire con la sostanza in esame né produrre effetti tossici. È opportuno usare preparazioni fresche della sostanza in esame.

Animali da esperimento

Si accoppiano topi del ceppo T (nonagouti, a/a, chinchilla, pink eye, c^{hp}/c^{hp} , brown, b/b, dilute, short ear, d se/d se, piebald spotting, s/s) con il ceppo HT (pallid, nonagouti, brachypody, pa a bp/pa a bp, leaden fuzzy, ln fz/ln fz, pearl pe/pe) o con C57 BL (nonagouti, a/a). Possono essere usati anche altri incroci appropriati, ad esempio fra NMRI (nonagouti, a/a, albino, c/c) e DBA (nonagouti, a/a, brown, b/b, dilute d/d), a condizione che producano prole nonagouti.

Numero e sesso

Viene trattato un numero di femmine gravide sufficiente per ottenere un numero appropriato di prole sopravvissute per ciascun livello di dosaggio usato. Le dimensioni appropriate del campione sono determinate dal

numero delle macchie osservate nei topi trattati e dalla scala dei dati di controllo. Un risultato negativo è accettabile soltanto quando si siano riscontrati almeno 300 figli di femmine trattate con la dose più alta.

Controlli positivi e negativi

È opportuno che siano disponibili dati di controllo simultanei ottenuti su topi trattati soltanto con il solvente (controlli negativi). Eventuali dati storici di controllo del medesimo laboratorio possono essere messi insieme con i dati di controllo nuovi in modo da accrescere la sensibilità del saggio, a condizione che essi siano omogenei. Se non si rileva alcuna mutagenicità per la sostanza in esame, dovrebbero essere disponibili dati di controllo positivo ottenuti di recente nel medesimo laboratorio in seguito a trattamento con una sostanza della quale sono noti gli effetti di mutagenicità con questo saggio.

Vie di somministrazione

Le vie abituali di somministrazione sono l'intubazione orale e l'iniezione intraperitoneale delle femmine gravide. Nei casi in cui ciò possa essere appropriato, si fa uso anche del trattamento per inalazione o di altre vie di somministrazione.

Livelli di dose

Si fa uso di almeno due livelli di dose, con uno dei livelli che dà luogo a segni di tossicità o ad una riduzione delle proporzioni della figliata. Per le sostanze non tossiche è opportuno ricorrere all'esposizione alla dose massima praticabile.

Procedimento

Viene di norma praticato un unico trattamento nel giorno 8, 9 o 10 di gravidanza, contando come giorno 1 quello in cui si è osservato per la prima volta il tappo vaginale. Detti giorni corrispondono a 7,25, 8,25 e 9,25 giorni dopo il concepimento. Possono essere praticati trattamenti successivi nel corso di detti giorni.

Analisi

La prole viene codificata e nel periodo fra tre o quattro settimane dopo la nascita si effettua su di essa l'analisi delle macchie pigmentale. Si distinguono tre categorie di macchie:

- macchie bianche a distanza fino a 5 mm dalla linea ventrale mediana, che si presume derivino dall'uccisione di cellule (WMVS),
- macchie gialle di tipo aguti, associate con le mammelle, gli organi genitali, le zone della gola, delle ascelle e dell'inguine e la parte mediana della fronte, che si presume derivino da difettoso differenziamento (MDS),
- macchie pigmentate e bianche distribuite in disordine sul manto, che si presume derivino da mutazioni somatiche (RS).

Devono essere osservate tutte e tre le categorie, ma ha rilevanza genetica soltanto l'ultima, RS. Eventuali problemi per quel che riguarda la distinzione fra MDS e RS possono essere risolti mediante microscopia fluorescente di peli presi come campione.

Va presa nota di evidenti anomalie morfologiche grossolane della prole.

2

DATI

I dati vengono presentati sotto forma del numero totale dei discendenti esaminati e del numero dei discendenti che hanno una o più macchie da mutazione somatica presunta. I dati relativi ai trattamenti ed al controllo negativo vengono posti a raffronto secondo metodi statistici appropriati. I dati sono anche presentati su base per prole.

3

RELAZIONE

3.1

Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- ceppi usati nell'incrocio,
- numero di femmine gravide nei gruppi trattati e nei gruppi di controllo,
- dimensioni medie delle figliate nei gruppi trattati ed in quelli di controllo alla nascita ed allo svezzamento,
- livelli di dose della sostanza in esame,
- solvente usato,

- giorno di gravidanza al quale è stato praticato il trattamento,
- vie di somministrazione del trattamento,
- numero complessivo dei discendenti esaminati, e numero dei discendenti con WMVS, MDS e RS nei gruppi trattati e in quelli di controllo,
- anomalie morfologiche grossolane,
- relazione dose/risposte di RS quando ciò sia possibile,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

B.25. TRASLOCAZIONI EREDITABILI: TOPO

1 METODO

1.1. Introduzione

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principi del metodo di saggio

Il saggio delle traslocazioni ereditabili nel topo rivela cambiamenti strutturali e numerici dei cromosomi nelle cellule germinali di mammiferi quali sono recuperate nella progenie della prima generazione. I tipi di mutazioni cromosomiche sono delle traslocazioni reciproche e, se è compresa progenie femminile, la perdita del cromosoma X. I portatori di traslocazione e le femmine XO presentano fertilità ridotta e di ciò è fatto uso per la selezione di progenie F_1 per l'analisi citogenetica. Taluni tipi di traslocazioni (autosoma-X e tipo c-t) provocano sterilità completa. Le traslocazioni sono citogeneticamente osservabili in cellule meiotiche alla diacinesi della metafase I di individui di sesso maschile, che sono o maschi F_1 o figli di femmine F_1 . Le femmine XO sono identificate citogeneticamente dalla presenza di 39 cromosomi soltanto nelle mitosi del midollo osseo.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio

Preparazioni

Le sostanze chimiche in esame vengono disciolte in soluzione salina isotonica. Se insolubili esse vengono disciolte o poste in sospensione in solventi appropriati. E fatto uso di soluzioni della sostanza in esame preparate di fresco.

Se si fa uso di un solvente per facilitare il dosaggio, esso non deve interferire con il composto in esame né dar luogo ad effetti tossici.

Vie di somministrazione

Le vie di somministrazione sono solitamente l'intubazione orale o l'iniezione intraperitoneale. Possono essere appropriate altre vie di somministrazione.

Animali da esperimento

Per la facilità della riproduzione e della verifica citologica, gli esperimenti in questione vengono effettuati sui topi. Non è necessario alcun ceppo di topi specifico. Tuttavia, nell'effettuazione di prove riguardanti la fertilità è opportuno che le dimensioni medie della figliata del ceppo usato siano di più di 8 neonati e siano inoltre relativamente costanti. Sono usati animali sani sessualmente maturi.

Numero di animali

Il numero degli animali occorrenti dipende dalla frequenza delle traslocazioni spontanee, e dal tasso minimo di induzione necessario per un risultato positivo. Il saggio si effettua normalmente mediante analisi della progenie maschile F_1 . È opportuno esaminare almeno 500 capi di progenie maschile F_1 per ciascun gruppo/dose. Se si include progenie femminile F_1 , occorrono 300 maschi e 300 femmine.

Uso di controlli negativi e positivi

Dovrebbero essere disponibili dati adeguati di controllo, derivati da controlli simultanei o storici. Qualora siano disponibili dati accettabili di controllo positivo da esperimenti condotti di recente nello stesso laboratorio, questi risultati possono essere usati in luogo del controllo positivo simultaneo.

Livelli di dose

Si sperimenta un solo livello di dose, ossia solitamente la dose più alta associata con la produzione dei minimi effetti tossici, ma senza che sia influenzato il comportamento riproduttivo o la sopravvivenza. Per stabilire una relazione dose/risposta sono necessarie due dosi supplementari più basse. Per le sostanze non tossiche è opportuno adottare un'esposizione alla dose massima praticabile.

Procedimento

Trattamento e accoppiamento

Sono possibili due schemi di trattamento. Nello schema più largamente usato e praticato un'unica somministrazione della sostanza in esame. Si può tuttavia procedere anche all'applicazione della sostanza in esame 7 giorni per settimana per 35 giorni. Il numero degli accoppiamenti successivi al trattamento è determinato dal programma di trattamento adottato, e deve essere stabilito in modo che siano considerati tutti gli stadi delle cellule germinali trattate. Al termine del periodo di accoppiamento, le femmine vengono tenute in gabbie individuali. Quando le femmine partoriscono, si prende nota della data, del numero e del sesso della progenie. Tutta la progenie maschile viene svezata, mentre tutta la progenie femminile viene scartata, salvo nel caso che la si includa nell'esperimento.

Controllo della eterozigosi di traslocazione

È praticato l'uno o l'altro di due metodi possibili:

- analisi della fertilità della progenie F_1 e successiva verifica degli eventuali portatori di traslocazione mediante analisi citogenetica,
- analisi citogenetica di tutta la progenie maschile F_1 senza selezione preliminare mediante analisi della fertilità.

a) Analisi della fertilità

La diminuzione della fertilità di un individuo F_1 può essere stabilita attraverso l'osservazione delle dimensioni della figliata e/o dell'analisi del contenuto uterino delle femmine accoppiate.

Devono essere stabiliti dei criteri specifici per la determinazione della fertilità normale e della fertilità diminuita nel ceppo di topi usato.

Osservazione dell'entità delle figliate. I maschi F_1 da sottoporre al saggio vengono posti in gabbia individualmente con femmine del medesimo esperimento o della colonia. Le gabbie vengono ispezionate giornalmente a partire da 18 giorni dopo l'accoppiamento. Viene presa nota alla nascita dell'entità della figliata e del sesso dalla progenie F_2 e le figliate vengono successivamente scartate. Se si sottopone al saggio la progenie femminile F_1 , si tiene la progenie F_2 di piccole figliate per un'ulteriore sperimentazione. Le portatrici femmine di traslocazioni sono verificate mediante analisi citogenetica di una traslocazione in uno qualsiasi dei loro discendenti maschi. Le femmine XO si riconoscono dal cambiamento del rapporto fra i sessi nella loro progenie (maschi/femmine da 1:1 a 1:2). In un procedimento in serie si escludono gli animali F_1 normali da sperimentazioni ulteriori se la prima figliata F_2 raggiunge o supera un valore normale predeterminato, altrimenti si osserva una seconda o una terza figliata F_2 . Gli animali F_1 che non possono essere classificati come normali dopo l'osservazione di un numero di figliate F_2 fino a tre vengono saggiati ulteriormente mediante l'analisi del contenuto uterino delle femmine con essi accoppiate, oppure sono direttamente sottoposti all'analisi citogenetica.

Analisi del contenuto uterino. La diminuzione dell'entità delle figliate nei portatori di traslocazioni è dovuta a morte dell'embrione, e di conseguenza un numero elevato di impianti morti è indicativo della presenza di una traslocazione nell'animale all'esame. I maschi F_1 da sottoporre al saggio vengono accoppiati con due, tre femmine ciascuno. Il concepimento viene determinato mediante ispezione giornaliera per l'osservazione di tappi vaginali fra le 8 e le 10 antimeridiane. Le femmine vengono uccise da 14 a 16 giorni dopo e viene presa nota degli impianti sia vivi che morti nei loro uteri.

b) Analisi citogenetica

Si allestiscono preparati di testicoli con la tecnica dell'essiccazione in aria. I portatori di traslocazioni sono identificati in base alla presenza di configurazioni multivalenti alla diacinesi di metafasi I degli spermatociti primari. L'osservazione di almeno due cellule con associazione multivalente costituisce la prova occorrente che l'animale sottoposto al saggio è un portatore di traslocazione.

Se non si è proceduto ad alcuna selezione nell'allevamento, sono esaminati citogeneticamente tutti i maschi F_1 . Deve essere riscontrato al microscopio un minimo di 25 diacinesi metafasi I per maschio. Per i maschi F_1 con testicoli piccoli e con degradazione meiotica prima della diacinesi e per le femmine F_1 sospette di XO è necessario l'esame delle metafasi mitotiche, degli spermatogoni o del midollo osseo. La presenza di un cromosoma insolitamente lungo e/o corto in ognuna di 10 cellule è il segno di una traslocazione particolare sterile del maschio (tipo c-t). Talune traslocazioni di autosoma X che provocano la sterilità del maschio possono essere identificate soltanto raggruppando l'analisi dei cromosomi mitotici. La presenza di 39 cromosomi nella totalità di 10 mitosi è il segno di una condizione di XO in una femmina.

2. DATI

I dati sono presentati in forma di tabelle. Sono riportati l'entità media delle figliate e il rapporto fra i sessi dagli accoppiamenti dei genitori alla nascita e allo svezzamento per ciascun intervallo di accoppiamento.

Per la valutazione della fertilità degli animali F_1 sono presentate le entità medie delle figliate di tutti gli accoppiamenti normali e le entità delle figliate singole dei portatori di traslocazioni F_1 . Per l'analisi del contenuto uterino è dato ragguaglio del numero medio degli impianti vivi e morti degli accoppiamenti normali e del numero individuale degli impianti vivi e morti per ciascun accoppiamento di portatori di traslocazione F_1 .

Per l'analisi citogenetica della diacinesi metafase I sono elencati per ciascun portatore di traslocazione il numero di tipi di configurazioni multivalenti ed il numero totale delle cellule.

Per gli individui F_1 sterili sono riportati il numero totale degli accoppiamenti e la durata del periodo di accoppiamento. Sono forniti i pesi dei testicoli e dettagli delle analisi citogenetiche.

Per le femmine XO sono riportati l'entità media delle figliate, il rapporto fra i sessi della progenie F_2 e i risultati dell'analisi citogenetica.

Se possibile i portatori di traslocazioni vengono preselezionati per mezzo di analisi della fertilità; le tabelle devono in tal caso recare l'indicazione del numero di soggetti così selezionati che sono risultati eterozigoti di traslocazione confermati.

Sono parimenti riportati i dati dei controlli negativi e degli esperimenti di controllo positivo.

3. RELAZIONE

3.1. Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- ceppo dei topi, età degli animali, pesi degli animali trattati,
- numero di animali genitori dell'uno e dell'altro sesso nei gruppi sottoposti al saggio e nei gruppi di controllo,
- condizioni di effettuazione del saggio, descrizione particolareggiata del trattamento, livelli di dosaggio, solventi, programmi di accoppiamento,
- numero e sesso dei piccoli nati per femmina, numero e sesso dei piccoli allevati per l'analisi della traslocazione,
- tempo e criteri dell'analisi della traslocazione,
- numero e descrizione particolareggiata dei portatori di traslocazioni ivi compresi i dati riguardanti la procreazione e i dati sul contenuto uterino, se del caso,
- procedimenti citogenetici e dettagli delle analisi microscopiche, di preferenza con illustrazioni,
- valutazione statistica,
- discussione dei risultati,
- interpretazione dei risultati.

3.2. Valutazione ed interpretazione

Vedi introduzione generale, parte B.

4. RIFERIMENTI

Vedi introduzione generale, parte B.

8.26. SAGGIO DI TOSSICITÀ ORALE SUBCRONICA**SAGGIO CON SOMMINISTRAZIONE ORALE RIPETUTA DI DOSI PER 90 GIORNI USANDO SPECIE DI RODITORI****1. METODO****1.1. Introduzione**

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principi del metodo di saggio

La sostanza sperimentale viene somministrata giornalmente, per via orale, in dosi scalari a vari gruppi di animali da laboratorio, una dose per gruppo e per un periodo di 90 giorni. Durante il periodo di somministrazione, gli animali vengono giornalmente sottoposti ad osservazione per individuare segni di tossicità. Gli animali che muoiono durante la prova vengono sottoposti a necropsopia; alla conclusione del saggio anche gli animali superstiti vengono sottoposti a necropsopia.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio**Preparazioni**

Gli animali sono tenuti nelle condizioni sperimentali di alloggiamento e nutrizione sperimentali per almeno 5 giorni prima dell'inizio del saggio. Prima dell'esperimento, gli animali giovani e sani vengono mischiati con metodo casuale ed assegnati ai gruppi di trattamento e di controllo.

La sostanza in esame può essere somministrata nella dieta, con sonda, in capsule o in acqua potabile. Il dosaggio per tutti gli animali dovrebbe essere fatto con lo stesso metodo durante l'intero periodo dell'esperimento. Se un veicolo od altri additivi sono utilizzati per facilitare il dosaggio, essi non dovrebbero notoriamente produrre effetti tossici. Se del caso, si possono utilizzare i dati storici.

Condizioni sperimentali**Animali da esperimento**

A meno che non vi siano controindicazioni, la specie preferita è il ratto. Si dovrebbero usare ceppi comunemente usati in laboratorio di giovani animali sani ed il dosaggio dovrebbe iniziare idealmente prima che i ratti abbiano raggiunto le sei settimane di età (comunque non più di 8 settimane). All'inizio dello studio, la variazione di peso degli animali usati non dovrebbe superare il $\pm 20\%$ del valore medio. Quando uno studio subcronico orale venga intrapreso come preliminare ad uno studio a lungo termine, si dovrebbe usare la stessa specie e lo stesso ceppo in entrambi gli studi.

Numero e sesso

Per ciascun livello di dose si dovrebbero utilizzare almeno 20 animali (10 maschi e 10 femmine). Le femmine dovrebbero essere nullipare e non gravide. Qualora si preveda di sacrificare ad intervalli alcuni animali, il numero dovrebbe essere aumentato del numero di animali che si prevede di sacrificare prima del completamento dello studio. Inoltre, un gruppo satellite di 20 animali (10 animali per sesso) può essere trattato con livelli di dose elevati per 90 giorni e sottoposto ad osservazione per l'individuazione della reversibilità, della persistenza o dell'insorgenza ritardata di effetti tossici per 28 giorni dopo il trattamento.

Livelli di dose

Si dovrebbero usare almeno tre livelli di dose e un controllo. Eccezion fatta per il trattamento con la sostanza in esame, gli animali del gruppo di controllo dovrebbero essere tenuti in modo identico a quelli del gruppo trattato. Quando si utilizza un veicolo per facilitare il dosaggio, ai controlli si dovrebbe somministrare il veicolo, allo stesso modo dei gruppi trattati; gli animali di controllo dovrebbero ricevere la stessa quantità di veicolo di quella ricevuta dal gruppo trattato col livello di dose più elevato. Il livello di dose più elevato dovrebbe provocare effetti tossici ma produrre pochi o nessun decesso. Il livello di dose più basso non dovrebbe produrre effetti tossici. Quando esista una valutazione utile dell'esposizione umana, il livello più basso dovrebbe superare detto valore.

Idealmente, il livello di dose intermedio dovrebbe produrre effetti tossici osservabili minimi. Se viene usata più di una dose intermedia, i livelli di dose dovrebbero essere intervallati per produrre una graduazione degli effetti tossici.

Nei gruppi trattati con livelli di dose bassi e intermedi e nei controlli, l'incidenza degli eventi letali dovrebbe essere bassa e tale da permettere una valutazione significativa dei risultati.

Quando la sostanza in esame viene somministrata nella dieta, si possono utilizzare sia una concentrazione dietetica costante (ppm o mg/kg di alimento) oppure un livello di dose costante in termini di peso corporeo degli animali; l'alternativa usata deve essere specificata. Per una sostanza somministrata con sonda, la dose dovrebbe essere somministrata ogni giorno allo stesso orario. I livelli di dose dovrebbero essere adattati ad intervalli (settimanalmente o ogni due settimane) per mantenere un livello di dose costante in termini di peso corporeo dell'animale.

Saggio limite

Se uno studio di 90 giorni, condotto conformemente al metodo descritto sotto, ad un livello di dose di 1 000 mg/kg di peso corporeo/giorno o ad un livello di dose più elevato in relazione ad una possibile esposizione umana (quando questa sia nota) non produce evidenze di effetti tossici, ulteriori prove possono essere considerate non necessarie. Per le sostanze a bassa tossicità è importante assicurarsi che, quando somministrate nella dieta, le quantità e le altre proprietà della sostanza in esame di cui trattasi non interferiscano con le esigenze nutrizionali normali.

Periodo di osservazione

Tutti gli animali dovrebbero essere quotidianamente sottoposti ad osservazione e si dovrebbero registrare i segni di tossicità inclusi il tempo di insorgenza, il grado e la durata. Si dovrebbero annotare anche il tempo della morte e quello dell'insorgenza o della scomparsa dei sintomi di tossicità.

Procedimento

Gli animali vengono trattati con la sostanza in esame, idealmente sette giorni per settimana, per un periodo di 90 giorni. Gli animali appartenenti ad ogni gruppo satellite previsto per ulteriori osservazioni dovrebbero essere tenuti ancora 28 giorni senza trattamento per individuare la guarigione oppure la persistenza degli effetti tossici.

Le osservazioni cliniche includeranno i cambiamenti della cute e del pelo, degli occhi e delle mucose nonché del sistema nervoso centrale e periferico, di quello respiratorio, circolatorio, dell'attività somatomotoria e del quadro comportamentale. Si dovrebbe procedere settimanalmente alla misurazione del consumo alimentare (e del consumo dell'acqua quando la sostanza in esame sia somministrata in tale veicolo) ed al peso degli animali.

Un'osservazione regolare degli animali è necessaria onde evitare per quanto possibile perdite di animali dallo studio dovute a cause come cannibalismo, autolisi dei tessuti o errata collocazione. Alla fine del periodo di esposizione tutti gli animali sopravvissuti saranno sottoposti ad autopsia; gli animali moribondi dovranno essere rimossi e sottoposti ad autopsia.

I seguenti esami vengono effettuati abitualmente per tutti gli animali, compresi i controlli:

- l'esame oftalmoscopico, eseguito con un oftalmoscopio o attrezzatura analoga idonea, dovrebbe essere effettuato prima della somministrazione della sostanza in esame e della conclusione dello studio, preferibilmente su tutti gli animali o perlomeno su quelli a cui viene somministrato il dosaggio elevato e al gruppo di controllo. Se vengono individuati cambiamenti agli occhi, tutti gli animali dovrebbero essere esaminati;
- alla fine del periodo di saggio, si dovrebbero effettuare le seguenti analisi: ematologia, inclusi ematocrito, concentrazione di emoglobina, conteggio degli eritrociti, conteggio totale e differenziale dei leucociti, una misurazione del potenziale di coagulazione, quali il tempo di coagulazione, il tempo di protrombina, il tempo di tromboplastina o il conteggio delle piastrine;
- la determinazione di biochimica clinica sul sangue dovrebbe essere effettuata alla fine del periodo di saggio. Le aree di saggio, ritenute opportune per tutti gli studi sono: equilibrio degli elettroliti, metabolismo dei carboidrati, funzione epatica e renale. La selezione delle prove specifiche sarà determinata dalle osservazioni

sul modo di azione della sostanza. Si suggeriscono le seguenti determinazioni: calcio, fosforo, cloruro, sodio, potassio, glucosio a digiuno (con un periodo di digiuno appropriato alla specie), glutammico piruvica transaminasi serica ⁽¹⁾, glutammico-ossalacetico transaminasi serica ⁽²⁾, ornitina decarbossilasi, gamma glutammil transpeptidase, azoto ureico, albumina, creatinina nel sangue, bilirubina totale e misurazione delle proteine totali del siero. Altre determinazioni che possono rendersi necessarie per una valutazione tossicologica adeguata, includono analisi dei lipidi, ormoni, equilibrio acido/base, metaemoglobina, attività della colinesterasi. Determinazioni biochimiche supplementari possono essere usate, se del caso, per estendere la ricerca sugli effetti osservati,

- d) l'analisi delle urine non è richiesta routinariamente, ma solo quando vi siano indicazioni basate sulla tossicità prevista o osservata,

Se i dati storici di base sono insufficienti, prima di iniziare il dosaggio si dovrebbe prendere in considerazione la determinazione dei parametri di biochimica clinica

Necropsia macroscopica

Tutti gli animali dovrebbero essere sottoposti a completa necropsia macroscopica che include l'esame della superficie esterna del corpo, di tutti gli orifizi e delle cavità craniche, toraciche e addominali e dei loro contenuti. Il fegato, i reni, le ghiandole surrenali e i testicoli dovrebbero essere pesati umidi, appena possibile dopo la dissezione, per evitare l'essiccamento. I seguenti organi e tessuti dovrebbero essere conservati in mezzo adatto per esami istopatologici futuri possibili: tutte le lesioni macroscopiche, cervello — comprese sezioni di midollo spinale/ponte, corteccia cerebellare e corteccia cerebrale, pituitaria, tiroide/paratiroide, qualsiasi tessuto timico, trachea e polmoni, cuore, aorta, (ghiandole salivari), milza, fegato, reni, ghiandole surrenali, pancreas, gonadi, utero, (organi genitali accessori), (pelle), esofago, stomaco, duodeno, digiuno, ileo, intestino cieco, colon, retto, vescica urinaria, linfonodi rappresentativi, (ghiandole mammarie femminili), (muscolatura della coscia), nervo periferico, sterno con midollo osseo, (occhi), (femore — compresa superficie articolare), (midollo spinale a tre livelli — cervicale, mediotoracico e lombare), e (ghiandole lacrimali esorbitali)

(I tessuti citati tra parentesi devono essere esaminati solo se presentano sintomi di tossicità o se vi siano indicazioni che sono l'organo-bersaglio coinvolto)

Esame istopatologico

- L'esame istopatologico completo dovrebbe essere effettuato sugli organi e sui tessuti degli animali nei gruppi trattati col dosaggio più elevato e nel gruppo di controllo,
- tutte le lesioni macroscopiche dovrebbero essere esaminate,
- esame degli organi-bersaglio in altri gruppi trattati con altre dosi,
- i polmoni degli animali nei gruppi trattati con dosaggi bassi ed intermedi dovrebbero essere sottoposti ad esame istopatologico per l'individuazione di infezioni, poiché ciò fornisce una valutazione appropriata dello stato di salute degli animali. Particolare attenzione dovrebbe inoltre essere dedicata in questi gruppi all'esame istopatologico del fegato e dei reni. Ulteriori esami istopatologici di routine possono non essere richiesti per gli animali di detti gruppi, ma devono sempre essere effettuati sugli organi che presentano lesioni, nel gruppo trattato con la dose elevata,
- quando si fa uso di un gruppo satellite, si dovrebbe eseguire l'esame istopatologico dei tessuti e degli organi che presentano lesioni nei gruppi trattati

2. DATI

I dati dovrebbero essere riassunti sotto forma di tabelle, indicando per ogni gruppo di saggio il numero di animali all'inizio della prova, il numero degli animali che presentano lesioni e la percentuale degli animali che presentano ciascun tipo di lesioni. I risultati dovrebbero essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

3. RELAZIONE

3.1 Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile

- specie, ceppo, origine, condizioni ambientali, dieta,
- condizione sperimentali,
- livelli di dose (veicolo compreso, se utilizzato) e concentrazioni,
- dati sulla risposta tossica per sesso e per dose,

⁽¹⁾ Ora nota come alanina aminotransferasi serica

⁽²⁾ Ora nota come aspartato aminotransferasi serica

- livello senza effetto, quando possibile,
- tempo della morte durante l'esperimento oppure specificare se gli animali erano sopravvissuti alla conclusione della prova,
- descrizione degli effetti tossici o di altri effetti,
- tempo di osservazione di ogni segno anormale e successivo decorso,
- alimentazione e dati sul peso corporeo,
- risultati oftalmologici,
- analisi ematologiche usate e risultati completi,
- analisi di biochimica clinica usate e risultati completi (compresi i risultati di ogni analisi delle urine),
- risultati nella necropsia,
- descrizione particolareggiata di tutti i risultati istopatologici,
- elaborazione statistica dei risultati, quando possibile,
- discussione dei risultati,
- interpretazione dei risultati

4 RIFERIMENTI

Vedi introduzione generale, parte B.

B.27. SAGGIO DI TOSSICITÀ ORALE SUBCRONICA**SAGGIO CON SOMMINISTRAZIONE ORALE RIPETUTA DI DOSI PER 90 GIORNI USANDO SPECIE DI NON RODITORI****1. METODO****1.1. Introduzione**

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principi del metodo di saggio

La sostanza sperimentale viene somministrata ogni giorno, oralmente in dosi graduate, a diversi gruppi di animali da esperimento (non roditori), una dose per gruppo, per un periodo di 90 giorni. Durante il periodo di somministrazione, gli animali sono sottoposti giornalmente ad osservazione per individuare i segni di tossicità. Gli animali che muoiono durante la prova sono sottoposti a necropsopia; alla conclusione dell'esperimento anche gli animali superstiti vengono sottoposti a necropsopia.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio**Preparazioni**

Gli animali sono tenuti nelle condizioni di alloggiamento e di alimentazione per almeno cinque giorni prima del saggio. Prima della prova, gli animali giovani e sani sono mischiati con metodo casuale ed assegnati ai gruppi di trattamento e a quello di controllo.

La sostanza in esame può essere somministrata nella dieta oppure la somministrazione in capsule può essere ritenuta più comoda. Altri mezzi di somministrazione orale possono essere utilizzati. Durante l'intero periodo sperimentale, il dosaggio agli animali dovrà essere fatto con lo stesso metodo. Se per facilitare il dosaggio si utilizzano un veicolo o altri additivi, essi dovrebbero essere noti per non produrre effetti tossici. Se del caso, si possono utilizzare i dati storici.

Condizioni sperimentali**Animali da esperimento**

La specie di non-roditori generalmente utilizzata è il cane, di razza preferibilmente definita. Altre specie di non-roditori possono essere utilizzate. Si dovrebbe usare esemplari giovani e sani, e, nel caso del cane, il dosaggio dovrebbe iniziare preferibilmente a 4-6 mesi e non più tardi di 9 mesi di età. Quando venga intrapreso uno studio di tossicità subcronica orale come preliminare ad uno studio a lungo termine, si dovrebbe usare la stessa specie e lo stesso ceppo in entrambi gli studi.

Numero e sesso

Per ciascun livello di dose si dovrebbero usare almeno 8 animali (4 maschi e 4 femmine). Alla conclusione dello studio, il numero di animali deve essere tale da garantire una valutazione significativa degli effetti tossici.

Livelli di dose

Si dovrebbero usare almeno tre livelli di dose e un controllo. Eccezion fatta per il trattamento con la sostanza in esame, gli animali nel gruppo di controllo dovrebbero essere trattati in modo identico ai soggetti dei gruppi trattati. Il livello di dose più elevato dovrebbe provocare effetti tossici ma non produrre decessi.

Il livello di dose più basso non dovrebbe produrre alcuna evidenza di effetti tossici. Quando esiste una valutazione utile della esposizione umana, il livello di dose più basso dovrebbe superare detto valore. Idealmente, il livello di dose medio dovrebbe produrre effetti tossici osservabili minimi. Se viene usata più di una dose intermedia, i livelli di dose dovrebbero essere intervallati per produrre una graduazione degli effetti tossici.

Nei gruppi a dosaggio basso ed intermedio e nei controlli non si dovrebbero verificare decessi.

Per sostanze a bassa tossicità è importante assicurarsi che, una volta somministrata nella dieta, le quantità della sostanza in esame non interferiscano con la nutrizione normale.

Quando la sostanza in esame viene somministrata nella dieta, si possono utilizzare sia una concentrazione dietetica costante (ppm o mg/kg di alimento) oppure un livello di dose costante in termini di peso corporeo degli animali; l'alternativa usata deve essere specificata. Quando somministrata direttamente, per esempio in capsule, la dose deve essere somministrata ogni giorno allo stesso orario ed adattata a seconda della necessità a intervalli settimanali per mantenere un livello di dose costante in termini di peso corporeo degli animali. Quando uno studio subcronico viene usato come premessa ad uno studio a lungo termine, in entrambi gli studi si dovrà usare una dieta analoga.

Saggio limite

Se uno studio di 90 giorni, condotto conformemente al metodo descritto sotto, ad un livello di dose di 1 000 mg/kg di peso corporeo/giorno o ad un livello di dose più elevato in relazione ad una possibile esposizione umana quando questa sia nota, non produce evidenze di effetti tossici, ulteriori prove possono essere considerate non necessarie. Per le sostanze a bassa tossicità è importante assicurarsi che, quando somministrate nella dieta, le quantità e le altre proprietà della sostanza in esame di cui trattasi non interferiscano con le esigenze nutrizionali normali.

Periodo di osservazione

Tutti gli animali dovrebbero essere osservati giornalmente e si dovrebbero registrare eventuali segni di tossicità, incluso il tempo di insorgenza, il grado e la durata. Si dovranno annotare anche il tempo della morte e quello dell'insorgenza o della scomparsa dei segni di tossicità.

Procedimento

Gli animali vengono trattati con la sostanza in esame, idealmente sette giorni per settimana, per un periodo di 90 giorni. Tuttavia, sulla base principalmente di considerazioni pratiche, quando la sostanza viene somministrata con modalità diverse da quella dell'aggiunta nella dieta, viene considerato accettabile che il dosaggio sia effettuato 5 giorni per settimana.

Le osservazioni dovrebbero includere, ma non essere limitate ai cambiamenti della cute e del pelo, degli occhi e delle mucose nonché del sistema nervoso centrale ed autonomo, di quello respiratorio e circolatorio, dell'attività somatomotoria e del quadro comportamentale. Si dovrebbe procedere settimanalmente alla misura del consumo alimentare (e del consumo dell'acqua quando la sostanza in esame è somministrata in tale veicolo) e alla pesatura degli animali.

Un accurato esame clinico degli animali dovrebbe essere eseguito quotidianamente con misure appropriate per minimizzare la perdita di animali del saggio. Alla fine del periodo di esposizione tutti gli animali sopravvissuti sono sottoposti a necropsia. Gli animali moribondi dovrebbero essere rimossi e sottoposti a necropsia quando notati.

I seguenti esami vengono effettuati abitualmente per tutti gli animali, compresi i controlli:

- a) l'esame oftalmoscopico, eseguito con un oftalmoscopio o idonea attrezzatura analoga, dovrebbe essere effettuato prima della somministrazione della sostanza in esame e alla conclusione dello studio, preferibilmente su tutti gli animali, o perlomeno su quelli trattati con il dosaggio più elevato e nel gruppo di controllo. Se vengono individuati cambiamenti agli occhi, tutti gli animali dovranno essere esaminati;
- b) all'inizio del saggio e, quindi, sia ad intervalli mensili o alla metà del periodo di saggio ed, infine, alla fine del saggio si dovrebbero effettuare le seguenti analisi: ematologia, incluso l'ematocrito, concentrazione di emoglobina, conteggio degli eritrociti, conteggio totale e differenziale dei leucociti, misura del potenziale coagulante, quali il tempo di coagulazione, il tempo di protrombina, il tempo di tromboplastina o conteggio delle piastrine;
- c) la determinazione della biochimica clinica sul sangue dovrebbe essere effettuata all'inizio del saggio e, quindi, sia ad intervalli mensili o alla metà del periodo di saggio ed, infine, alla fine del saggio. Gli aspetti di saggio ritenuti opportuni per tutti gli studi sono: equilibrio degli elettroliti, metabolismo dei carboidrati, funzione epatica e renale. La selezione delle prove specifiche sarà determinata dalle osservazioni sul modo di azione della sostanza. Si suggerisce di determinare: calcio, fosforo, cloruro, sodio, potassio, glucosio a digiuno (con periodo di digiuno appropriato alla specie/ceppo), glutammico-piruvico transaminasi serica ⁽¹⁾, glutammico-ossalacetico transaminasi serica ⁽²⁾, ornitina decarbossilasi, gamma glutamil transpeptidasi, azoto

⁽¹⁾ Ora nota come alanina aminotransferasi serica.

⁽²⁾ Ora nota come aspartato aminotransferasi serica.

ureico, albumina, creatinina nel sangue, bilirubina totale e misura delle proteine totali del siero. Altre determinazioni che possono rendersi necessarie per una valutazione tossicologica adeguata, includono analisi dei lipidi, ormoni, equilibrio acido/base, metacromoglobina, attività della colinesterasi. Determinazioni biochimiche supplementari possono essere usate, se del caso, per estendere la ricerca sugli effetti osservati. I non-roditori dovrebbero essere tenuti a digiuno per un periodo di tempo (non più di 24 ore) prima di prelevare i campioni di sangue.

- d) l'analisi delle urine non è richiesta routinariamente, ma solo quando vi sia una indicazione basata sulla tossicità prevista o osservata.

Necropsia macroscopica

Tutti gli animali dovrebbero essere sottoposti a necropsia macroscopica completa, che include l'esame della superficie esterna del corpo, di tutti gli orifizi e delle cavità cranica, toracica e addominale e dei loro contenuti. Il fegato, i reni, le ghiandole surrenali, la tiroide (e le paratiroidi) e i testicoli dovrebbero essere pesati umidi, appena possibile dopo la dissezione, per evitare l'essiccamento. I seguenti organi e tessuti dovrebbero essere conservati in un mezzo adatto per futuri possibili esami istopatologici: tutte le lesioni generali, cervello — comprese sezioni di midollo/ponte, corteccia cerebellare e corteccia cerebrale, pituitaria, tiroide/paratiroide, qualsiasi tessuto timico, (trachea), polmoni, cuore, aorta, ghiandole salivari, milza, fegato, reni, ghiandole surrenali, pancreas, gonadi, utero, (organi genitali accessori), (pelle), cistifellea, esofago, stomaco, duodeno, digiuno, ileo, intestino cieco, colon, retto, vescica, urinaria, linfonodi rappresentativi, (ghiandole mammarie femminili), (muscolatura della coscia), nervo periferico (occhi), sterno con midollo osseo, (femore — compresa superficie articolare) e (midollo spinale a tre livelli — cervicale, emitoracico e lombare) (I tessuti citati tra parentesi devono essere esaminati solo se presentano sintomi di tossicità o se vi siano indicazioni che sono l'organo bersaglio coinvolto).

Esame istopatologico

Dovrebbe essere effettuato l'esame istopatologico completo degli organi e dei tessuti degli animali del gruppo trattato con la dose elevata e del gruppo di controllo. Un ulteriore esame istopatologico dovrebbe essere effettuato in gruppi trattati con altre dosi sugli organi che presentano lesioni nel gruppo trattato con la dose elevata o per le quali le osservazioni cliniche indichino tale esigenza.

2 DATI

I dati dovrebbero essere riassunti sotto forma di tabelle, indicando per ogni gruppo sperimentale il numero di animali all'inizio della prova, il numero degli animali che presentano lesioni, i tipi di lesione e la percentuale degli animali che presenta ciascun tipo di lesione. I risultati dovrebbero essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

3 RELAZIONE

3.1 Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, origine, condizioni ambientali, dieta, ecc.,
- condizione sperimentali,
- livelli di dose (veicolo compreso, se utilizzato) e concentrazioni,
- risposte tossiche per sesso e per dose,
- livello senza effetto, quando possibile,
- tempo della morte durante lo studio, oppure specificare se gli animali sono sopravvissuti fino alla conclusione del saggio,
- descrizione degli effetti tossici o di altri effetti (con particolare attenzione ai risultati clinici),
- tempo di osservazione di ogni segno anomalo e successivo decorso,
- dati di immentazione sul peso corporeo,
- risultati oftalmologici,

- analisi ematologiche usate e risultati completi,
- analisi di biochimica clinica usate e risultati completi (compresi i risultati di qualsiasi analisi delle urine),
- risultati della necropsia,
- una descrizione particolareggiata di tutti i risultati istopatologici,
- elaborazione statistica dei risultati, quando appropriata,
- discussione dei risultati,
- interpretazione dei risultati.

4 **RIFERIMENTI**

Vedi introduzione generale, parte B.

B.28. SAGGIO DI TOSSICITÀ CUTANEA SUBCRONICA**SAGGIO CON SOMMINISTRAZIONE CUTANEA RIPETUTA DI DOSI PER 90 GIORNI USANDO SPECIE DI RODITORI****1. METODO****1.1. Introduzione**

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principi del metodo di saggio

La sostanza sperimentale viene applicata quotidianamente alle cute in dosi scalari a vari gruppi di animali da esperimento, una dose per gruppo per un periodo di 90 giorni. Durante il periodo di somministrazione, gli animali vengono giornalmente sottoposti ad osservazione per individuare segni di tossicità. Gli animali che muoiono durante il saggio vengono sottoposti a necropsopia, ed alla conclusione della prova anche gli animali superstiti vengono sottoposti a necropsopia.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio*Preparazioni*

Gli animali sono tenuti nelle condizioni sperimentali di alloggiamento ed alimentazione per almeno 5 giorni prima dell'inizio del saggio. Prima dell'esperimento, gli animali giovani e sani vengono mischiati con metodo casuale ed assegnati ai gruppi di trattamento e di controllo. Poco prima dell'inizio dell'esperimento gli animali da trattare vengono tosati nella zona dorsale del tronco. Si può usare la rasatura, ma questa dovrebbe essere effettuata circa 24 ore prima del saggio. La tosatura o la rasatura usualmente deve essere ripetuta ad intervalli approssimativamente settimanali.

Durante la tosatura o la rasatura del pelo, occorre fare attenzione a non scorticare la pelle. La superficie corporea da trattare per l'applicazione della sostanza in esame non dovrebbe essere inferiore al 10 % del totale. Il peso dell'animale dovrebbe essere preso in considerazione quando si decidono le dimensioni delle superficie da liberare dal pelo e dalla copertura. Quando si saggiano solidi, che possono essere polverizzati se del caso, la sostanza in esame dovrebbe essere umidificata sufficientemente con l'acqua o, se necessario, con un veicolo adatto per assicurare un buon contatto con la pelle. Le sostanze in esame liquide sono in genere usate non diluite. L'applicazione quotidiana si estenderà da 5 a 7 giorni per settimana.

*Condizioni sperimentali***Animali da esperimento**

Si possono utilizzare esemplari adulti di ratto, coniglio o cavia. Altre specie possono essere utilizzate, ma il loro uso richiede una giustificazione. All'inizio del saggio, la gamma di variazione del peso dovrebbe essere $\pm 20\%$ del peso medio. Quando uno studio di tossicità subcronica cutanea viene condotto come preliminare ad uno studio a lungo termine, in entrambi gli studi si dovrebbe usare la stessa specie e lo stesso ceppo.

Numero e sesso

Per ciascun livello di dose si dovrebbero utilizzare almeno 20 animali (10 maschi e 10 femmine) con pelle sana. Le femmine dovrebbero essere nullipare e non gravide. Se si prevede di sacrificare ad intervalli alcuni animali, il numero totale dovrebbe essere aumentato del numero di animali che si prevede di sacrificare prima del completamento dello studio. Inoltre, un gruppo satellite di 20 animali (10 animali per sesso) può essere trattato con il livello di dose elevato per 90 giorni e sottoposto ad osservazione per l'individuazione della reversibilità, della persistenza o dell'insorgenza ritardata di effetti tossici per 28 giorni dopo il trattamento.

Livelli di dose

Almeno tre livelli di dose con un controllo o un controllo del veicolo, se si utilizza un veicolo, sono richiesti. Il periodo di esposizione dovrebbe essere di almeno 6 ore al giorno. L'applicazione della sostanza in esame dovrebbe essere eseguita ogni giorno alla stessa ora e la quantità di sostanza applicata dovrebbe essere aggiustata a intervalli (settimanali o bisettimanali) per mantenere un livello costante di dose in termini di peso corporeo dell'animale. Eccezion fatta per il trattamento con la sostanza in esame, gli animali nel gruppo di controllo dovrebbero essere trattati in modo identico ai soggetti dei gruppi trattati. Quando per facilitare il dosaggio si usa un veicolo, il gruppo di controllo del veicolo dovrebbe essere sottoposto a dosaggio come i gruppi trattati, e ricevere la stessa quantità che riceve il gruppo a livello di dose più elevata. Il livello di dose più elevato dovrebbe provocare effetti tossici ma produrre pochi o nessun decesso. Il livello di dose più basso non dovrebbe produrre effetti tossici. Quando esista una valutazione utile di esposizione umana, il livello più basso dovrebbe superare questo valore.

Idealmente, il livello di dose intermedio dovrebbe produrre effetti tossici osservabili minimi. Se viene usata più di una dose intermedia, i livelli di dose dovrebbero essere intervallati per produrre una graduazione degli effetti tossici. Nei gruppi trattati con livello di dose basso, intermedio e nei controlli, l'incidenza delle morti dovrà essere bassa e tale da permettere una valutazione significativa dei risultati.

Se l'applicazione della sostanza in esame produce irritazioni gravi della pelle, le concentrazioni dovrebbero essere ridotte e ciò può provocare una riduzione, o l'assenza, di altri effetti tossici al livello di dose elevato. Se la pelle è stata gravemente danneggiata, può rendersi necessaria l'interruzione dello studio. Si procederà quindi a un nuovo studio con concentrazione più basse.

Saggio limite

Se uno studio preliminare con livello di dose di 1 000 mg/kg o un livello di dose più elevato in relazione a una possibile esposizione umana, quando questa sia nota, non produce effetti tossici, ulteriori prove possono non essere considerate necessarie.

Periodo di osservazione

Gli animali da esperimento dovrebbero essere osservati quotidianamente per individuare eventuali segni di tossicità. Il tempo della morte e quello dell'insorgenza o della scomparsa dei segni di tossicità dovrebbero essere registrati.

Procedimento

Gli animali dovrebbero essere ingabbiati individualmente e sottoposti a trattamento con la sostanza in esame, idealmente 7 giorni per settimana, per un periodo di 90 giorni.

Gli animali appartenenti a ciascun gruppo satellite previsto per ulteriori osservazioni dovrebbero essere mantenuti ancora per 28 giorni per individuare i sintomi di guarigione oppure di persistenza degli effetti tossici. Il tempo di esposizione dovrebbe essere 6 ore/giorno.

La sostanza in esame dovrebbe essere applicata uniformemente su un'area che è approssimativamente il 10 % della superficie corporea totale. Con sostanze molto tossiche, la superficie coperta può essere inferiore, ma deve comunque essere coperta da uno strato più uniforme e più sottile possibile.

Durante l'esposizione, la sostanza in esame viene tenuta a contatto con la pelle da una fascia porosa di garza e da un nastro non-irritante. La superficie cutanea su cui è applicata la sostanza dovrebbe essere coperta opportunamente in modo da trattenere la fascia e la sostanza in esame, per evitare un'eventuale ingestione da parte degli animali della sostanza in esame. Si può ricorrere a mezzi per limitare i movimenti dell'animale, ma l'immobilizzazione completa non è un metodo raccomandato.

Alla fine del periodo di esposizione, la sostanza in esame residua dovrebbe essere rimossa, ove possibile, con l'uso di acqua o con qualche altro metodo appropriato per pulire la pelle.

Tutti gli animali dovrebbero essere quotidianamente sottoposti a osservazione e si dovrebbe registrare i segni di tossicità, incluso il tempo d'insorgenza, l'intensità e la durata. Le osservazioni collaterali dovrebbero includere i cambiamenti della cute e del pelo, degli occhi e delle mucose, nonché del sistema nervoso centrale e autonomo, del sistema respiratorio e circolatorio, dell'attività somatomotoria e del quadro comportamentale. Si dovrebbe procedere settimanalmente alla misura del consumo alimentare e alla pesatura degli animali. L'osservazione regolare degli animali è necessaria per assicurarsi che gli stessi non siano persi a causa di cannibalismo, autolisi dei tessuti o smarrimento. Alla fine del periodo di studio tutti gli animali sopravvissuti dei gruppi di trattamento non satelliti sono sottoposti a necropsia. Gli animali moribondi dovrebbero essere rimossi e sottoposti a necropsia.

I seguenti esami vengono effettuati abitualmente per tutti gli animali, compresi i controlli:

- a) l'esame oftalmoscopico, eseguito con un oftalmoscopio o attrezzatura analoga, dovrebbe essere effettuato prima della somministrazione della sostanza sperimentale e alla conclusione dello studio, preferibilmente su tutti gli animali, o perlomeno su quelli a cui vengono somministrati il dosaggio elevato, e infine al gruppo di controllo. Se vengono individuati cambiamenti negli occhi, tutti gli animali dovrebbero essere esaminati;

- b) alla fine del periodo di saggio, si dovrebbero effettuare le seguenti analisi: ematologia, incluso ematocrito, concentrazione di emoglobina degli eritrociti, conteggio totale e differenziale dei leucociti, misurazione del potenziale di coagulazione, quale il tempo di coagulazione, il tempo di protrombina, il tempo di tromboplastina o il conteggio delle piastrine,
- c) la determinazione della biochimica clinica sul sangue dovrebbe essere effettuata alla fine del periodo di saggio. Le aree di studio, ritenute opportune per tutti gli studi sono: equilibrio degli elettroliti, metabolismo dei carboidrati, funzione epatica e renale. La selezione di prove specifiche sarà determinata dalle osservazioni sul modo di azione della sostanza. Si suggerisce di determinare: calcio, fosforo, cloruro, sodio, potassio, glucosio a digiuno (con periodo di digiuno appropriato alla specie), glutammico-piruvico transaminasi serica ⁽¹⁾, glutammico-ossalacetico transaminasi serica ⁽²⁾, ornitina decarbossilasi, gamma glutamil transpeptidase, azoto ureico, albumina, creatinina ematica, bilirubina totale e proteine totali del siero. Altre determinazioni che possono rendersi necessarie per una valutazione tossicologica adeguata, includono: analisi dei lipidi, ormoni, equilibrio acido/base, metaemoglobina, attività della colinesterasi. Determinazioni biochimiche supplementari possono essere usate, se necessarie, per estendere la ricerca di effetti osservati,
- d) l'analisi delle urine non è richiesta routinariamente, ma solo quando vi sia una indicazione basata sulla tossicità prevista o osservata. Se i dati storici di base sono insufficienti, prima di iniziare il dosaggio si dovrebbe prendere in considerazione la determinazione dei parametri ematologici e di biochimica clinica.

Necropsia macroscopica

Tutti gli animali dovrebbero essere sottoposti a necropsia microscopica completa che include l'esame della superficie esterna del corpo, di tutti gli orifizi e delle cavità craniale, toracica e addominale e dei loro contenuti. Il fegato, i reni, le ghiandole surrenali e i testicoli devono essere pesati umidi, appena possibile dopo la dissezione per evitare l'essiccamento. I seguenti organi e tessuti dovrebbero essere conservati in mezzo adatto per possibili esami istopatologici futuri: tutte le lesioni macroscopiche, cervello — comprese sezioni di midollo/ponte, corteccia cerebellare e corteccia cerebrale, pituitaria, tiroide/paratiroide, qualsiasi tessuto timico, (trachea), polmoni, cuore, aorta, ghiandole salivari, fegato, milza, reni, ghiandole surrenali, pancreas, gonadi, utero, organi genitali accessori, cistifellea (se esiste), esofago, stomaco, duodeno, digiuno, ileo, intestino cieco, colon, retto, vescica urinaria, linfonodi rappresentativi, (ghiandole mammarie femminili), (muscolatura della coscia), nervo periferico (occhi), (sterno con midollo osseo), (femore — compresa superficie articolare), (midollo spinale a tre livelli — cervicale, emitoracico e lombare) e (ghiandole lacrimali esorbitali) (I tessuti citati tra parentesi devono essere esaminati solo se presentano sintomi di tossicità o se vi siano indicazioni che sono l'organo bersaglio coinvolto).

Esame istopatologico

- a) L'esame istopatologico completo dovrebbe essere effettuato sugli cute normale e sugli cute trattati e sugli organi e tessuti degli animali nel gruppo trattato con dosaggio elevato e nel gruppo di controllo.
- b) tutte le lesioni macroscopiche dovrebbero essere esaminate,
- c) gli organi-bersaglio dovrebbero essere esaminati anche nei gruppi trattati con altre dosi,
- d) quando si usano i ratti, si dovrebbe eseguire l'esame istopatologico dei polmoni degli animali dei gruppi trattati con dosaggi bassi e intermedi per l'individuazione di infezioni poiché ciò fornisce una valutazione appropriata dello stato di salute degli animali. Ulteriori esami istopatologici di routine possono non essere richiesti per gli animali di questi gruppi, ma devono sempre essere effettuati sugli organi che presentano lesioni nel gruppo trattato con dosi elevate,
- e) quando si fa uso di un gruppo satellite, si dovrebbe eseguire l'esame istopatologico dei tessuti e degli organi che presentano lesioni in altri gruppi trattati.

2

DATI

I dati dovrebbero essere riassunti sotto forma di tabelle, indicando per ogni gruppo sperimentale il numero di animali all'inizio del saggio, il numero di animali che presentano lesioni, il tipo di lesioni e la percentuale degli animali che presentano ciascun tipo di lesione. I risultati dovrebbero essere valutati con un metodo statistico appropriato. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, origine, condizioni ambientali, dieta,
- condizione sperimentali,

B.29. SAGGIO DI TOSSICITA SUBCRONICA INALATORIA**SAGGIO CON SOMMINISTRAZIONE INALATORIA RIPETUTA DI DOSI PER 90 GIORNI USANDO SPECIE DI RODITORI****1. METODO****1.1. Introduzione**

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principi del metodo di saggio

Diversi gruppi di animali da esperimento sono esposti quotidianamente per un periodo definito alla sostanza in esame in concentrazioni graduate, utilizzando una concentrazione per gruppo, per un periodo di 90 giorni. Quando si utilizza un veicolo per contribuire a generare una concentrazione appropriata della sostanza in esame nell'atmosfera, si dovrebbe utilizzare un gruppo di controllo per il veicolo. Durante il periodo di somministrazione, gli animali vengono giornalmente sottoposti ad osservazione per individuare segni di tossicità. Gli animali che muoiono durante il saggio sono sottoposti a necropsopia; alla conclusione del saggio anche gli animali superstiti vengono sottoposti a necropsopia.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio**Preparazioni**

Gli animali sono tenuti nelle condizioni di alloggiamento e di alimentazione sperimentali per almeno cinque giorni prima dell'inizio della prova. Prima del saggio, animali giovani e sani sono mischiati con metodo casuale ed assegnati ai gruppi di trattamento e di controllo.

Se necessario, un veicolo adatto può essere aggiunto alla sostanza in esame per contribuire a generare una concentrazione appropriata della sostanza nell'atmosfera. Se un veicolo o altri additivi vengono utilizzati per facilitare il dosaggio, essi dovrebbero essere noti per non produrre effetti tossici. Se del caso, i dati storici possono essere usati.

Condizioni sperimentali**Animali sperimentali**

A meno che vi siano controindicazioni, la specie preferita è il ratto. Si dovrebbero usare animali sani giovani di ceppi comunemente usati in laboratorio. All'inizio dello studio la gamma di variazione del peso degli animali usati non dovrebbe essere superiore al $\pm 20\%$ del peso medio. Quando venga intrapreso uno studio subcronico per inalazione come preliminare ad uno studio a lungo termine, in entrambi gli studi si dovrebbe usare la stessa specie e stesso ceppo.

Numero e sesso

Per ciascuna concentrazione di esposizione si dovrebbero utilizzare almeno 20 animali (10 femmine e 10 maschi). Le femmine dovrebbero essere nullipare e non gravide. Se si prevede di sacrificare ad intervalli alcuni animali il numero dovrebbe essere aumentato del numero di animali che si prevede di sacrificare prima del completamento dello studio. Inoltre, un gruppo satellite di 20 animali (10 animali per sesso) può essere trattato con il livello di dose elevato per 90 giorni e sottoposto ad osservazione per l'individuazione della reversibilità, della persistenza o dell'insorgenza ritardata di effetti tossici per 28 giorni dopo il trattamento.

Concentrazione di esposizione

Sono richieste almeno tre concentrazioni, con un controllo o un controllo del veicolo (che corrisponde alla concentrazione del veicolo al livello più elevato) se si utilizza un veicolo. Eccezion fatta per il trattamento con la sostanza in esame, gli animali nel gruppo di controllo dovrebbero essere trattati in modo identico agli animali dei gruppi. La concentrazione più elevata dovrebbe provocare effetti tossici ma nessuna o poche morti. Quando esista una valutazione utile dell'esposizione umana, la concentrazione più bassa dovrebbe superare detto valore. Idealmente la concentrazione media dovrebbe produrre effetti tossici osservabili minimi. Se viene usata più di una concentrazione intermedia le concentrazioni dovrebbero essere intervallate per produrre una graduazione di effetti tossici.

Nei gruppi trattati con concentrazioni basse ed intermedie e nei controlli, l'incidenza delle morti dovrebbe essere bassa per permettere una valutazione significativa dei risultati.

Tempo di esposizione

La durata dell'esposizione quotidiana dovrebbe essere di 6 ore, dopo la stabilizzazione delle concentrazioni delle camere di inalazione. Altri tempi di esposizione possono essere usati per esigenze specifiche.

Attrezzatura

Gli esperimenti sugli animali dovrebbero essere effettuati in apparecchiatura per inalazione progettata per sostenere una corrente dinamica d'aria con almeno 12 cambiamenti d'aria l'ora, per assicurare un tenore di ossigeno adeguato e un'atmosfera di esposizione a distribuzione uniforme. Quando si usi una camera di inalazione la progettazione dovrebbe essere tale da evitare l'accumulo degli animali e di aumentare al massimo la loro esposizione per inalazione alla sostanza in esame. Di massima, per assicurare la stabilità dell'atmosfera della camera, il «volume» totale degli animali di saggio non dovrebbe superare il 5 % del volume della camera di prova. Si può usare il sistema di esposizione oro-nasale, della testa soltanto o del corpo intero. I primi due sistemi ridurranno al massimo l'assorbimento da altre vie.

Periodo di osservazione

Gli animali sperimentali dovrebbero quotidianamente essere sottoposti ad osservazione per individuare i segni di tossicità durante l'intero periodo di trattamento e di recupero. Si dovrebbe registrare anche il tempo della morte e quello dell'insorgenza o della scomparsa dei segni di tossicità.

Procedimento

Gli animali vengono esposti alla sostanza in esame 5-7 giorni per settimana, per un periodo di 90 giorni. Gli animali appartenenti ai gruppi satelliti previsti per ulteriori osservazioni dovrebbero essere tenuti ancora per 28 giorni senza trattamento per individuare la guarigione o la persistenza degli effetti tossici. La temperatura durante la prova dovrebbe essere mantenuta a 22 °C (\pm 3 °C). Idealmente, l'umidità relativa dovrà essere mantenuta tra il 30 % ed il 70 %, ma in certi casi (ad esempio, saggi di aerosols) ciò potrebbe non essere possibile. Il cibo e l'acqua non dovrebbero essere somministrati durante l'esposizione.

Si dovrebbe usare un sistema dinamico con un idoneo sistema di controllo analitico della concentrazione. Per stabilire le opportune concentrazioni di esposizione si raccomanda di effettuare una prova. Il flusso d'aria dovrebbe essere regolato in modo da garantire che le condizioni nella camera d'esposizione siano omogenee. Il sistema dovrebbe garantire che condizioni stabili di esposizione siano realizzate il più rapidamente possibile.

Si dovrebbero misurare e controllare:

- la velocità della corrente d'aria (in continuo),
- la concentrazione reale della sostanza in esame misurata nella zona di respirazione. Durante il periodo di esposizione quotidiana, la concentrazione non dovrebbe subire variazioni più del \pm 15 % del valore medio. Tuttavia, nel caso delle polveri e degli aerosols questo livello di controllo potrebbe non essere realizzabile e un più vasto intervallo sarebbe quindi accettabile. Durante tutto il periodo dello studio la concentrazione giornaliera dovrebbe essere tenuta costante nei limiti del possibile. Durante la messa a punto del sistema di generazione si dovrebbe eseguire l'analisi delle dimensioni e delle particelle per stabilire la stabilità delle concentrazioni di aerosol. Durante l'esposizione, le analisi dovrebbero essere effettuate con la necessaria frequenza per determinare l'uniformità di distribuzione delle dimensioni delle particelle,
- temperatura ed umidità,
- durante e dopo l'esposizione le osservazioni sono effettuate e registrate sistematicamente, per ogni animale si dovrebbero tenere registri individuali. Tutti gli animali dovrebbero essere osservati quotidianamente e si dovrebbero registrare i segni di tossicità, incluso il tempo di insorgenza, il grado e la durata. Le osservazioni collaterali dovrebbero includere i cambiamenti della cute e del pelo, degli occhi e delle mucose nonché del sistema nervoso centrale ed autonomo, di quello respiratorio e circolatorio, dell'attività somatomotoria e del quadro comportamentale. Si dovrebbe procedere settimanalmente alla misura del consumo alimentare ed alla pesatura degli animali. L'osservazione regolare degli animali è necessaria per assicurare che gli stessi non siano

persi per lo studio a causa di cannibalismo, autolisi dei tessuti o smarrimento. Alla fine del periodo di studio tutti gli animali sopravvissuti sono sottoposti a necropsia. Gli animali moribondi dovrebbero essere rimossi e sottoposti a necropsia, quando moriti.

I seguenti esami vengono effettuati abitualmente per tutti gli animali, compresi i controlli.

- l'esame oftalmoscopico, eseguito con un oftalmoscopio o idonea attrezzatura analoga, dovrebbe essere effettuato prima dell'esposizione alla sostanza in esame e alla conclusione dello studio, preferibilmente su tutti gli animali o perlomeno su quelli cui viene somministrato il dosaggio elevato e al gruppo di controllo. Se vengono individuati cambiamenti agli occhi tutti gli animali dovrebbero essere esaminati,
- alla fine del periodo di saggio, si dovrebbero effettuare le seguenti analisi: ematologia, incluso ematocrito, concentrazione di emoglobina, conteggio degli eritrociti, conteggio totale e differenziale dei leucociti, misura del potenziale di coagulazione, quale il tempo di coagulazione, il tempo di protrombina, il tempo di tromboplastina o conteggio delle piastrine,
- la determinazione della biochimica clinica sul sangue dovrebbe essere effettuata alla fine del periodo di saggio. Le aree di saggio che sono considerate opportune per tutti gli studi sono: equilibrio degli elettroliti, metabolismo dei carboidrati, funzione epatica e renale. La selezione delle prove specifiche sarà determinata dalle osservazioni sul modo di azione della sostanza. Si suggerisce di determinare: calcio, fosforo, cloruro, sodio, potassio, glucosio a digiuno (con periodo di digiuno appropriato alla specie), glutammico piruvico transaminasi serica ⁽¹⁾, glutammico ossalacetico transaminasi serica ⁽²⁾, ornitina decarbossilasi, gamma glutamil transpeptidasi, azoto ureico, albumina, creatinina nel sangue, bilirubina totale e misurazione delle proteine totali del siero. Altre determinazioni che possono rendersi necessarie per una valutazione tossicologica adeguata, includono: analisi dei lipidi, ormoni, equilibrio acido/base, metaemoglobina, attività della colinesterasi. Determinazioni biochimiche supplementari possono essere usate, se necessario, per estendere la ricerca sugli effetti osservati,
- l'analisi delle urine non è richiesta routinariamente, ma solo quando vi siano indicazioni basate sulla tossicità prevista o osservata.

Se i dati storici di base sono insufficienti, prima di iniziare il dosaggio si dovrebbe prendere in considerazione la determinazione dei parametri ematologici e di biochimica clinica.

Necropsia macroscopica

Tutti gli animali dovrebbero essere sottoposti a necropsia macroscopica completa, che include l'esame della superficie esterna del corpo, di tutti gli orifici e delle cavità cranica, toracica e addominale e dei loro contenuti. Il fegato, i reni, le ghiandole surrenali e i testicoli dovranno essere pesati umidi, appena possibile dopo la dissezione, per evitare l'essiccamento. I seguenti organi e tessuti dovrebbero essere conservati in mezzo adatto per possibili esami istopatologici futuri: tutte le lesioni generali, polmoni — che dovrebbero essere rimossi intatti, pesati e trattati con un fissativo adatto per garantire che la struttura polmonare rimanga intatta (la perfusione con fissativo è considerata un procedimento efficace), tessuti rinofaringei, cervello — comprese sezioni di midollo/ponte, corteccia cerebellare e corteccia cerebrale, pituitaria, tiroide/paratiroide, qualsiasi tessuto timico, trachea e polmoni, cuore, aorta, ghiandole salivari, milza, fegato, reni, ghiandole surrenali, pancreas, gonadi, utero (organi genitali accessori), (pelle), cistifellea (se presente), esofago, stomaco, duodeno, digiuno, ileo, intestino cieco, colon, retto, vescica urinaria, linfonodi rappresentativi, (ghiandole mammarie femminili), (muscolatura della coscia), nervo periferico (occhi), sterno con midollo osseo, (femore — compresa superficie articolare), (midollo spinale a tre livelli — cervicale, toracico e lombare), e (ghiandole lacrimali esorbitali). (I tessuti citati tra parentesi devono essere esaminati solo se presentano segni di tossicità o se vi siano indicazioni che sono l'organo-bersaglio coinvolto).

Esame istopatologico

- L'esame istopatologico completo dovrebbe essere effettuato sulle vie respiratorie e su altri organi e tessuti di tutti gli animali nel gruppo trattato con dosaggio elevato e nel gruppo di controllo,
- tutte le lesioni macroscopiche dovrebbero essere esaminate,
- gli organi-bersaglio in gruppi trattati con altre dosi dovrebbero essere esaminati,
- i polmoni degli animali nei gruppi trattati con dosaggio basso ed intermedio dovrebbero essere sottoposti ad esame istopatologico per l'individuazione di infezioni, poiché ciò fornisce una valutazione appropriata dello stato di salute degli animali. Ulteriori esami istopatologici di routine possono non essere richiesti per gli animali di questi gruppi, ma devono sempre essere effettuati sugli organi che presentano lesioni nel gruppo trattato con dose elevata,
- quando si fa uso di gruppo satellite, si dovrebbe eseguire l'esame istopatologico degli stessi tessuti e degli organi che presentano effetti in altri gruppi trattati.

⁽¹⁾ Ora nota come alanina aminotransferasi serica

⁽²⁾ Ora nota come aspartato aminotransferasi serica

2 DATI

I dati dovrebbero essere riassunti sotto forma di tabelle, indicando per ogni gruppo di saggio il numero di animali all'inizio del saggio, il numero degli animali che presentano lesioni, i tipi di lesione e la percentuale degli animali che presenta ciascun tipo di lesioni. I risultati dovrebbero essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

3 RELAZIONE

3.1 Relazione sul saggio.

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, origine, condizioni ambientali, dieta;
- condizioni sperimentali:

descrizione dell'apparecchiatura di esposizione inclusi progettazione, tipo, dimensioni, generatore dell'aria, sistema di generazione delle particelle e degli aerosol, metodo di condizionamento dell'aria, trattamento dell'aria di scarico e metodo di alloggiamento degli animali in una camera di saggio, quando questa sia usata. L'attrezzatura per la misura della temperatura, dell'umidità e, se del caso, della stabilità delle concentrazioni di aerosol o delle dimensioni delle particelle dovrebbe essere descritta;

dati di esposizione: i dati dovrebbero essere tabulati presentati con valori medi e una misura della variabilità (per esempio deviazione standard) e dovrebbero includere:

- a) velocità del flusso dell'aria attraverso l'attrezzatura per l'inalazione;
- b) temperatura ed umidità dell'aria;
- c) concentrazioni nominali (quantità totale della sostanza in esame immessa nell'apparecchiatura per l'inalazione, divisa per il volume dell'aria);
- d) natura del veicolo, se usato;
- e) concentrazione reali nella zona di respirazione;
- f) dimensioni delle particelle mediane (se del caso);

- dati sulla risposta tossica per sesso e per concentrazione;
- livello senza effetto, quando possibile;
- tempo della morte (durante l'esperimento) oppure specificare se gli animali sono sopravvissuti fino alla conclusione della prova;
- descrizione degli effetti tossici o di altri effetti;
- tempo di osservazione di ogni segno anormale e successivo decorso;
- dati di alimentazione sul peso corporeo;
- risultati oftalmologici;
- prove ematologiche usate e risultati completi;
- prove di biochimica clinica usate e risultati (compresi i risultati dell'analisi delle urine);
- risultati della necropsia;
- descrizione particolareggiata di tutti i risultati istopatologici;
- elaborazione statistica dei risultati, quando possibile;
- discussione dei risultati;
- interpretazione dei risultati.

3.2. Valutazione ed interpretazione

Vedi introduzione generale, parte B.

4. RIFERIMENTI

Vedi introduzione generale, parte B.

B.30. SAGGIO DI TOSSICITÀ CRONICA

1 METODO

1.1. Introduzione

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principio del metodo di saggio

La sostanza in esame è somministrata normalmente 7 giorni per settimana, per una via opportuna, a diversi gruppi di animali sperimentali, una dose per gruppo, per la maggior parte della loro durata di vita. Durante e dopo l'esposizione alla sostanza in esame, gli animali sperimentali sono sottoposti ad osservazione quotidianamente per individuare segni di tossicità.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio

Preparazioni:

Gli animali sono tenuti nelle condizioni di alloggiamento e nutrizione sperimentali per almeno 5 giorni prima dell'inizio del saggio. Prima dell'esperimento, gli animali giovani e sani vengono mescolati con metodo casuale ed assegnati a gruppi di trattamento e di controllo.

*Condizioni di saggio**Animali da laboratorio*

La specie preferita è il ratto. Sulla base dei risultati di studi precedentemente effettuati, altre specie (roditori o non-roditori) possono essere utilizzate. Si dovrebbero usare i ceppi di laboratorio generalmente utilizzati di giovani animali sani ed il dosaggio dovrebbe iniziare non appena possibile dopo lo svezzamento.

All'inizio dello studio, la variazione di peso negli animali usati non dovrebbe superare il $\pm 20\%$ del valore medio. Quando venga intrapreso uno studio di tossicità subcronica orale come preliminare ad uno studio a lungo termine, si dovrebbe usare la stessa specie e lo stesso ceppo in entrambi gli studi.

Numero e sesso

Per ciascun livello di dose si dovrebbero utilizzare, per i roditori, almeno 40 animali (20 maschi e 20 femmine) e un gruppo di controllo parallelo. Le femmine dovrebbero essere nullipare e non gravide. Se si prevede di sacrificare alcuni animali, il loro numero dovrà essere aumentato del numero di animali che si prevede di sacrificare prima del completamento dello studio.

Per i non-roditori un numero inferiore di animali, almeno 4 per sesso e per gruppo, è accettabile.

Livelli di dose e frequenza dell'esposizione

Si dovrebbero utilizzare almeno tre livelli di dose oltre al gruppo di controllo. Il livello di dose più elevato dovrebbe provocare sintomi precisi di tossicità senza causare eccessiva mortalità. Il livello di dose più basso non dovrebbe produrre alcuna evidenza di tossicità.

Le dosi (le dosi) intermedia(e) dovrebbe(ro) essere fissat(e) in un intervallo intermedio tra le dosi elevate e quelle basse.

Nella scelta dei livelli di dose si dovrebbe tener conto dei dati ottenuti da precedenti saggi e studi di tossicità.

Normalmente, la frequenza dell'esposizione è quotidiana. Se la sostanza chimica viene somministrata in acqua potabile o mescolata nella dieta, essa dovrebbe essere continuamente disponibile.

Controlli

Si dovrebbe usare un gruppo di controllo parallelo identico sotto tutti i punti di vista ai gruppi esposti, eccezion fatta per l'esposizione alla sostanza in esame.

In circostanze specifiche, come in studi di inalazione che richiedono l'uso di aerosol o di un emulsionante ad attività biologica non caratterizzata in studi orali, si dovrebbe usare anche un gruppo di controllo negativo parallelo. In gruppo di controllo negativo riceve lo stesso trattamento degli altri gruppi di animali sperimentali, eccettuato il fatto che gli animali non sono esposti alla sostanza sperimentale né ad alcun veicolo.

Vie di somministrazione

Le due vie principali di somministrazione sono quella orale e quella inalatoria. La scelta della via di somministrazione dipende dalle caratteristiche fisiche e chimiche della sostanza in esame e della via probabile di esposizione dell'uomo.

L'uso della via cutanea presenta considerevoli problemi pratici. La tossicità sistemica cronica derivante dall'assorbimento percutaneo può essere arguita normalmente dai risultati dell'altra prova orale e dalla conoscenza dell'entità dell'assorbimento percutaneo derivata dalle prove di tossicità percutanea.

Studi orali

Ove la sostanza in esame sia assorbita dal tratto gastro-intestinale, e se la via orale è una via di esposizione degli esseri umani, la via orale di somministrazione è quella preferita, a meno che non vi siano controindicazioni. Gli animali possono ricevere la sostanza in esame nella loro dieta, sciolta in acqua potabile, o in capsula. Idealmente, dovrebbe essere usato un dosaggio giornaliero, sette giorni per settimana, perché un dosaggio di cinque giorni/settimana potrebbe provocare un recupero o una tossicità da privazione nel periodo di mancato dosaggio, influenzando così il risultato e la valutazione successiva. Tuttavia, sulla base principalmente di considerazioni pratiche, il dosaggio su una base di cinque giorni/settimana è considerato accettabile.

Studi di inalazione

Poiché gli studi sull'inalazione offrono problemi tecnici di maggior complessità delle altre vie di somministrazione, vengono qui fornite indicazioni più particolareggiate su questo modo di somministrazione. Dovrebbe essere notato che l'installazione endotracheale può costituire un'alternativa valida in situazioni specifiche.

Le esposizioni a lungo termine sono di solito modellate sulla esposizione umana prevista, che prevede per gli animali un'esposizione quotidiana di 6 ore dopo equilibratura delle concentrazioni nella camera, per 5 giorni/settimana (esposizione intermittente), o su un'esposizione ambientale possibile, con 22-24 ore di esposizione/giorno, 7 giorni/settimana (esposizione continua), con circa un'ora/giorno per nutrire gli animali allo stesso orario e per la manutenzione della camera.

In entrambi i casi, gli animali sono di solito esposti a concentrazioni fisse delle sostanze in esame. Una differenza importante da considerare tra l'esposizione intermittente e quella continua è che, con la prima, vi è un periodo di 17-18 ore in cui gli animali possono riprendersi dagli effetti di ogni esposizione quotidiana, e un periodo di recupero ancora più lungo durante i fine settimana.

La scelta dell'esposizione intermittente o continua dipende dagli obiettivi dello studio e dall'esposizione umana che deve essere simulata. Tuttavia, certe difficoltà tecniche devono essere considerate. Per esempio, i vantaggi dell'esposizione continua per simulare le condizioni ambientali possono essere controbilanciati dalla necessità di nutrire e abbeverare gli animali durante l'esposizione, o di disporre di aerosol di tipo più complicato (e affidabile) e di sistemi di generazione di vapore e di controllo.

Camere di esposizione

Gli animali dovrebbero essere sottoposti a sperimentazione in camere di inalazione progettate per sostenere un flusso dinamico con almeno 12 cambiamenti d'aria/ora, per assicurare un tenore di ossigeno adeguato e un'atmosfera di esposizione uniforme. Le camere di esposizione e di controllo dovrebbero essere identiche nella costruzione e nella progettazione, per poter assicurare condizioni di esposizione comparabili sotto tutti gli aspetti, eccezion fatta per l'esposizione alle sostanze in esame. Nella camera viene generalmente mantenuta una leggera depressione per impedire la fuoriuscita delle sostanze in esame nella zona circostante. Nelle camere si dovrebbe ridurre al minimo l'affollamento degli animali. Come regola generale, al fine di assicurare la stabilità dell'atmosfera della camera, il «volume» totale degli animali di saggio non dovrebbe superare il 5% del volume della camera.

Si dovrebbero eseguire le misure o i controlli sottoelencati

- i) Flusso dell'aria: la velocità del flusso d'aria attraverso la camera dovrebbe essere controllata preferibilmente in modo continuo
- ii) Concentrazione: durante il periodo di esposizione quotidiana, la concentrazione della sostanza in esame non dovrebbe variare di più o meno il 15 % del valore medio
- iii) Temperatura ed umidità: per i roditori la temperatura dovrebbe essere mantenuta sui 22 °C (± 2 °C), e l'umidità all'interno della camera al 30-70 %, eccetto quando l'acqua è usata per mantenere in sospensione la sostanza di prova nell'atmosfera della camera. Preferibilmente entrambe dovrebbero essere controllate in continuo
- iv) Misura delle dimensioni delle particelle: la distribuzione delle dimensioni delle particelle dovrebbe essere determinata sulle atmosfere di camere che contengano aerosol liquidi o solidi. Le particelle contenute negli aerosol dovrebbero avere dimensioni tali da essere inalabili dall'animale da laboratorio usato. I campioni di atmosfera dovrebbero essere prelevati a livello della zona di respirazione degli animali. Il campione d'aria dovrebbe essere rappresentativo della distribuzione delle particelle a cui gli animali sono esposti e dovrebbe rappresentare, su una base gravimetrica, tutto l'aerosol sospeso anche quando gran parte di esso non è respirabile. Le analisi della grandezza delle particelle dovrebbero essere effettuate spesso durante la messa a punto del sistema di generazione per assicurare la stabilità dell'aerosol e, in seguito, quando si ritenga necessario, durante le esposizioni, per determinare in modo adeguato l'uniformità della distribuzione delle particelle a cui gli animali sono stati esposti

Durata dello studio

La durata del periodo di somministrazione dovrebbe essere di almeno 12 mesi

Procedimento

Osservazioni

Un accurato esame clinico dovrebbe essere eseguito almeno quotidianamente. Oltre alle osservazioni supplementari, si dovrebbero adottare le misure appropriate per ridurre al massimo la perdita di animali, ad esempio necropsia o refrigerazione degli animali trovati morti e isolamento o sacrificio degli animali deboli o moribondi. Si dovrebbero eseguire accurate osservazioni per individuare l'insorgere e la progressione di tutti gli effetti tossici e per ridurre al massimo le perdite dovute a malattia, ad autolisi, o a cannibalismo

I segni clinici, comprese le alterazioni oculari e neurologiche nonché la mortalità, dovrebbero essere registrati per tutti gli animali. Si dovrebbero registrare il tempo di insorgenza e la progressione delle condizioni tossiche, compresi i tumori sospetti

Una registrazione individuale del peso corporeo di tutti gli animali dovrebbe essere effettuata una volta per settimana, durante le prime 13 settimane del periodo di saggio ed almeno una volta ogni 4 settimane in seguito. La quantità di cibo ingerita dovrebbe essere determinata settimanalmente durante le prime 13 settimane dello studio, e poi a intervalli di circa tre mesi, a meno che lo stato di salute o le variazioni del peso corporeo non impongano altre soluzioni

Esame ematologico

L'esame ematologico (ad esempio contenuto di emoglobina, volume delle cellule ammassate, eritrociti totali, leucociti totali, piastrine, o altre misure di potenziale di coagulazione) dovrebbe essere eseguito dopo 3 mesi, 6 mesi e quindi a intervalli di circa 6 mesi, ed alla conclusione dello studio, su campioni di sangue raccolti da tutti i non-roditori e da 10 ratti per sesso di tutti i gruppi. Se possibile, questi prelievi dovrebbero essere effettuati ogni volta sugli stessi ratti. Inoltre, si dovrebbe raccogliere un campione prima dell'esperimento dai non-roditori

Se le osservazioni cliniche indicano un deterioramento nella salute degli animali durante lo studio, si dovrebbe eseguire un conteggio differenziale ematico dei suddetti animali

Un conteggio differenziale ematico viene eseguito sui campioni provenienti dagli animali del gruppo a dosaggio più elevato e dai controlli. I conteggi differenziali ematici sono eseguiti per il gruppo seguente (o i gruppi seguenti) trattato con dosaggio inferiore, soltanto se vi sono discordanze importanti tra il gruppo trattato con dosaggio più elevato ed i controlli, o se vi sono indicazioni derivanti dai risultati dall'esame patologico

Analisi delle urine

Per l'analisi si dovrebbero prelevare campioni di urina da tutti i non-roditori e da 10 ratti per sesso di tutti i gruppi, se possibile dagli stessi ratti ed agli stessi intervalli dell'esame ematologico. Le seguenti determinazioni dovrebbero essere effettuate o sui singoli animali o su una miscela dei campioni per sesso e per gruppo di roditori

— aspetto: volume e densità per i singoli animali,

- proteine, glucosio, chetoni, sangue occulto (semiquantitativamente),
- microscopia del sedimento (semiquantitativamente)

Chimica clinica

Approssimativamente a intervalli di 6 mesi, ed alla conclusione del saggio, si prelevano campioni di sangue per le determinazioni di chimica clinica da tutti i non-roditori e da 10 ratti/sesso di tutti i gruppi, se possibile dagli stessi ratti a ogni intervallo. Inoltre si dovrebbe prelevare un campione prima dell'esperimento dai non-roditori. Da questi campioni viene preparato il plasma e vengono eseguite le seguenti analisi:

- concentrazione delle proteine totali;
- concentrazione dell'albumina,
- saggio di funzionalità epatica (quali attività fosfatasi alcalina, glutammico piruvico transaminasi ⁽¹⁾ e transaminasi glutammico-ossalacetica ⁽²⁾, glutammil transpeptidasi, ornitina decarbossilasi),
- metabolismo dei carboidrati, quali glucosio ematico a digiuno,
- saggi di funzionalità renale, quali azoto ureico ematico

Necropsia macroscopica

È necessario un esame necroscopico completo di tutti gli animali, compresi quelli morti durante l'esperimento o uccisi perché moribondi. Prima del sacrificio da tutti gli animali si dovrebbero prelevare campioni di sangue per i conteggi differenziali ematici. Tutte le lesioni macroscopiche visibili, i tumori o le lesioni sospette quali tumori dovrebbero essere conservate. Si dovrebbe cercare di correlare le osservazioni macroscopiche con i risultati degli esami microscopici.

Tutti gli organi e i tessuti dovrebbero essere conservati per l'esame istopatologico. Questo di solito riguarda i seguenti organi e tessuti: cervello ⁽³⁾ (midollo/ponte, corteccia cerebellare, corteccia cerebrale), pituitaria, tiroide (compresa paratiroide), timo, polmoni (trachea compresa), cuore, aorta, ghiandole salivari, fegato ⁽³⁾, milza, rene ⁽³⁾, ghiandole surrenali ⁽³⁾, esofago, stomaco, duodeno, digiuno, ileo, intestino cieco, colon, retto, utero, vescica urinaria, linfonodi, pancreas, gonadi ⁽³⁾, organi genitali accessori, ghiandole mammarie femminili, pelle, muscolatura, nervo periferico, midollo spinale (cervicale, toracico, lombare), sterno con midollo osseo e femore (articolazione compresa) e occhi. L'insufflazione dei polmoni e della vescica urinaria con un fissativo e il modo ottimale di conservare questi tessuti; l'insufflazione dei polmoni negli studi di inalazione è essenziale per eseguire un esame istopatologico appropriato. Negli studi speciali, quali quelli di inalazione, si studieranno l'intero tratto respiratorio compreso naso, faringe e laringe.

Se si eseguono altri esami clinici, le informazioni ottenute da questi dovranno essere disponibili prima dell'esame microscopico, perché esse possono fornire indicazioni significative al patologo.

Istopatologia

Tutte le alterazioni visibili, in particolare i tumori ed altre lesioni che si verificano in qualsiasi organo, dovrebbero essere esaminati microscopicamente. Inoltre si raccomandano le seguenti procedure:

- a) esame microscopico di tutti gli organi e tessuti conservati, con descrizione completa di tutte le lesioni riscontrate in:
 - 1 tutti gli animali che sono morti durante lo studio, e
 - 2 tutti quelli dei gruppi trattati con la dose elevata e controlli. Questi organi, prelevati da 10 animali per sesso e per gruppo per i roditori e da tutti i non roditori, più tiroide (con paratiroide) per tutti i non-roditori, dovrebbero essere pesati,
- b) gli organi o i tessuti che mostrano anomalie causate, o possibilmente causate dalla sostanza in esame, vengono esaminati anche negli animali appartenenti ai gruppi trattati con le dosi più basse,
- c) se il risultato dell'esperimento evidenzia una riduzione sostanziale della longevità normale degli animali o induzione di effetti in grado di influire sulla risposta tossica, gli animali del gruppo trattato con livello di dose immediatamente inferiore dovrebbero essere esaminati come sopra descritto,
- d) informazioni sull'incidenza di lesioni normalmente riscontrate nel ceppo degli animali usati, nelle stesse condizioni di laboratorio ossia i dati storici dei controlli sono indispensabili per valutare correttamente l'importanza dei mutamenti osservati negli animali trattati.

⁽¹⁾ Ora nota come alanino-amminotransferasi serica

⁽²⁾ Ora nota come aspartato-amminotransferasi serica

⁽³⁾ Questi organi, prelevati da 10 animali per sesso e per gruppo per i roditori e da tutti i non roditori, più tiroide (con paratiroidi) per tutti i non roditori, dovrebbero essere pesati.

2 DATI

I dati dovrebbero essere riassunti sotto forma di tabelle, indicando per ogni gruppo di saggio il numero di animali all'inizio del saggio, il numero degli animali che presenta lesioni e la percentuale degli animali che presenta ciascun tipo di lesione. I risultati dovrebbero essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

3 RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile

- specie, ceppo, origine, condizioni ambientali, dieta
- condizioni sperimentali

descrizione dell'apparecchiatura per l'esposizione, inclusi: progettazione, tipo, dimensioni, fonte dell'aria, sistema per generare particelle e aerosol, metodo di condizionamento dell'aria, trattamento dell'aria di scarico e metodo di alloggiamento degli animali in una camera di saggio, quando questa è utilizzata. L'attrezzatura per misurare la temperatura, l'umidità e, se del caso, la stabilità di concentrazione degli aerosol o la dimensione delle particelle dovrebbe essere descritta,

dati di esposizione dovrebbero essere presentati in forma tabulare con i valori medi e la misura della variabilità (per esempio deviazione standard) e dovrebbero includere

- a) portate dell'aria attraverso l'attrezzatura di inalazione,
- b) temperatura ed umidità dell'aria,
- c) concentrazioni nominali (quantità totale della sostanza in esame immessa nell'attrezzatura di inalazione divisa per il volume dell'aria),
- d) natura del veicolo, se usato,
- e) concentrazioni reali nella zona sperimentale di respirazione,
- f) dimensioni delle particelle medianti (se del caso),
- livelli di dose (incluso il veicolo, se usato) e le concentrazioni,
- dati relativi agli effetti tossici per sesso e dose,
- livello senza effetti,
- tempo di eventi letali durante lo studio o se gli animali erano vivi al completamento del saggio,
- descrizione degli effetti tossici e di altri effetti,
- registrazione della data di osservazione di ogni sintomo anomalo e successivo decorso,
- dati di alimentazione e di peso corporeo,
- risultati oftalmologici,
- prove ematologiche usate e risultati completi,
- saggi di biochimica clinica usati e risultati completi (compresi i risultati dell'analisi delle urine),
- risultati della necropsia;
- descrizione particolareggiata di tutti i risultati istopatologici,
- elaborazione statistica dei risultati, quando possibile,
- discussione dei risultati,
- interpretazione dei risultati

1.4 Principi del metodo di saggio

La sostanza sperimentale viene somministrata in dosi o concentrazioni graduate, per almeno quella parte della gravidanza che copre il periodo dell'organogenesi, a diversi gruppi di animali sperimentali gravidi, una dose per gruppo. Poco prima della data prevista del parto l'animale viene ucciso, l'utero tolto ed il contenuto esaminato. Questo metodo sperimentale copre la embriotossicità e la fetotossicità.

1.5 Criteri qualitativi

Nessuno

1.6 Descrizione del metodo di saggio**Preparazioni**

Le giovani femmine vergini adulte in buona salute, di età e dimensioni comparabili, vengono acclimatate in condizioni di laboratorio per almeno 5 giorni prima dello studio; vengono poi accoppiate con maschi di comprovata fertilità. Le femmine inseminate vengono randomizzate ed assegnate ai gruppi di trattamento. L'accoppiamento può avvenire naturalmente o tramite inseminazione artificiale. La sostanza da saggiare viene somministrata ogni giorno alle femmine, immediatamente dopo l'impianto e durante l'intero periodo dell'organogenesi. Un giorno prima del termine, i feti vengono asportati con isterectomia ed esaminati per determinare eventuali anomalie viscerali o scheletriche, includenti ossificazione ritardata, ritardo della crescita ed emorragie intestinali.

Condizioni sperimentali**Animali da laboratorio**

Le specie generalmente usate sono il ratto, il topo, il criceto ed il coniglio. Le specie preferite sono il ratto ed il coniglio. Sarà opportuno usare ceppi generalmente utilizzati in laboratorio. Il ceppo non dovrà essere a bassa fecondità e dovrà essere caratterizzato per la sua risposta ai teratogeni. Gli animali dovranno essere ingabbiati individualmente.

Numero e sesso

Per ogni livello di dose si richiedono almeno 20 femmine di ratto, di topo o di criceto gravide, oppure 12 coniglie. L'obiettivo è di assicurare un numero sufficiente di parti per permettere una valutazione del potenziale teratogeno della sostanza.

Livelli di dose

Si richiedono almeno 3 gruppi di dosaggio e un gruppo di controllo. Quando la sostanza da saggiare è somministrata in un veicolo, si richiede anche un gruppo di controllo del veicolo. Se si utilizza un veicolo, le sue proprietà tossicologiche dovranno essere note, esso non dovrà essere teratogeno né avere effetti sulla riproduzione. Ad eccezione del trattamento con la sostanza da saggiare, gli animali nel gruppo di controllo dovranno essere

trattati in modo identico agli animali del gruppo trattato. A meno che non sia limitato dalla natura fisico/chimica o dalle proprietà biologiche della sostanza, il livello più elevato di dose dovrà idealmente indurre una certa tossicità materna evidente, quale una leggera perdita del peso, ma non più del 10 % di morti. Il livello basso di dose non dovrà indurre effetti osservabili attribuibili alla sostanza da saggiare. La dose intermedia dovrà essere intervallata geometricamente tra i livelli di dose elevati e quelli bassi.

Prova limite

Nel caso di sostanza a bassa tossicità, se un livello di dose di almeno 1 000 mg/kg non produce sintomi di embriotossicità o di teratogenicità, prove con altri livelli di dose possono essere considerate superflue.

Tempo di esposizione

Il giorno 0 nella prova è il giorno in cui sono osservati (se possibile) il tappo vaginale e/o lo sperma. Il periodo in cui si somministra la dose dovrebbe riguardare il periodo principale dell'organogenesi. Per il ratto ed il topo, questo può essere compreso fra il 6° e il 15° giorno; tra il 6° e il 14° per il criceto, e per il coniglio tra il 6° e il 18°. Se il giorno 0 è quello in cui si è osservato l'accoppiamento o l'inseminazione artificiale, ai tempi di cui sopra si dovrà aggiungere 1 giorno. Alternativamente, il periodo del dosaggio può essere esteso approssimativamente di 1 giorno prima della data prevista per il parto.

Periodo di osservazione

Un accurato esame clinico dovrà essere fatto almeno una volta al giorno. Osservazioni supplementari dovranno avvenire quotidianamente, con azioni appropriate prese per minimizzare la perdita di animali durante l'esperimento.

Procedimento

La sostanza da saggiare è somministrata oralmente, con sonda.

La sostanza da saggiare dovrà essere somministrata approssimativamente ogni giorno alla stessa ora.

Agli animali la laboratorio di sesso femminile viene somministrata ogni giorno la sostanza da saggiare, durante il periodo prescritto. La dose può essere basata sul peso delle femmine all'inizio della somministrazione della sostanza, o, alternativamente, in vista del rapido aumento di peso che ha luogo durante la gravidanza, gli animali possono essere pesati periodicamente, ed il dosaggio basato sulla determinazione più recente del peso. I sintomi di tossicità dovranno essere registrati al momento dell'osservazione, insieme con la data di inizio, il grado e la durata. Le femmine che minacciano l'aborto o il parto prematuro dovranno essere sacrificate e sottoposte ad esame macroscopico accurato. Il periodo di osservazione post-trattamento dovrà continuare fino a circa un giorno prima del termine; l'obiettivo è di coprire la maggior parte del periodo di gravidanza, ma di evitare eventuali complicazioni di interpretazione dei risultati che potrebbero sorgere in seguito alle nascite naturali. Le osservazioni parallele includeranno, ma con si limiteranno a: modificazione della cute e del pelo, degli occhi e delle mucose, nonché del sistema nervoso centrale ed autonomo, di quello respiratorio e circolatorio, dell'attività somatomotoria e del modello comportamentale. Si dovrebbe procedere settimanalmente alla misura del consumo alimentare e alla pesatura degli animali.

Necropsia macroscopica

Alla morte, durante, o alla fine dello studio, l'animale dovrà essere sottoposto ad esame macroscopico per identificare tutte le anomalie strutturali o le modificazioni patologiche che hanno potuto influenzare la gravidanza. Immediatamente dopo la morte, l'utero dovrà essere tolto ed il contenuto esaminato per eventuale constatazione di morte dell'embrione o del feto e del numero di feti vivi. In genere, è possibile stimare la data di morte nell'utero, quando questa si è verificata. Nei ratti e nei conigli è possibile determinare il numero dei corpi lutei.

Si determinerà il sesso dei feti, si eseguirà la relativa pesatura individuale con registrazione e derivazione del peso fetale medio. Dopo la rimozione ogni feto dovrà essere esaminato esternamente. Per i ratti, i topi e i criceti, la metà di ogni figliata dovrà essere preparata per l'osservazione di anomalie scheletriche, e la parte rimanente di ogni figliata verrà preparata per l'osservazione di anomalie o sintomi di eventuale disfacimento tissulare usando metodi appropriati. Per i conigli, ogni feto verrà esaminato con accurata dissezione per il riscontro di anomalie viscerali e di anomalie scheletriche.

2.

DATI

I dati devono essere riassunti sotto forma di tabelle, indicando per ogni gruppo sperimentale il numero di animali all'inizio della prova, il numero di quelli divenuti gravidi, il numero e le percentuali dei feti vivi e dei feti che presentano anomalie scheletriche o disfacimento tissulare nonché la loro relazione con figliate specifiche. I risultati devono essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

3. RELAZIONE**3.1. Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, origine, condizioni ambientali, dieta, ecc.,
- condizioni sperimentali,
- livelli di dose (veicolo compreso, se utilizzato) e concentrazioni,
- dati sulla risposta tossica per dose,
- livello senza effetto (quando possibile),
- registrazione della data della morte durante lo studio oppure specificare se gli animali sono sopravvissuti fino alla conclusione della prova,
- descrizione degli effetti tossici o di altri effetti,
- registrazione della data di osservazione di ogni sintomo anomalo e successivo decorso,
- dati sulla alimentazione e sul peso corporeo,
- durata della gravidanza e dati sulle figliate (inclusi dati storici),
- dati ferali (vivi/morti, sesso, anomalie dei tessuti molli e anomalie scheletriche),
- dati sulla figliata (vivi/morti, sesso, anomalie dei tessuti molli e anomalie scheletriche),
- elaborazione statistica dei risultati quando possibile,
- discussione dei risultati,
- interpretazione dei risultati

B.32. SAGGIO DI CANCEROGENESI

1. METODO

1.1. Introduzione

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principio del metodo di saggio

La sostanza da saggiare è somministrata normalmente 7 giorni per settimana, tramite via appropriata, a diversi gruppi di animali sperimentali, una dose per gruppo, per la maggior parte della loro durata di vita. Durante e dopo l'esposizione alla sostanza, gli animali verranno sottoposti giornalmente ad osservazione per individuare i sintomi della tossicità, in particolare lo sviluppo dei tumori.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio

Preparazioni

Gli animali sono tenuti nell'alloggio sperimentale e nutriti per almeno 5 giorni prima dell'inizio della prova. Prima dell'esperimento, gli animali giovani e sani vengono randomizzati ed assegnati a gruppi stabiliti.

Animali da laboratorio

La specie preferita è il ratto. Sulla base dei risultati di studi precedentemente intrapresi, altre specie (roditori o non-roditori) possono essere utilizzate. Sarà opportuno usare ceppi di giovani animali sani generalmente utilizzati in laboratorio e il dosaggio dovrà iniziare non appena possibile dopo lo svezzamento. All'inizio dello studio, la variazione di peso degli animali usati non dovrà superare più o meno 20 % del valore medio. Quando vengano intrapresi studi di subcronicità orale come preliminari ad uno studio a lungo termine, si dovranno usare le stesse specie in entrambi gli studi.

Numero e sesso

Si utilizzeranno animali di entrambi i sessi.

La somministrazione del dosaggio ai roditori dovrà cominciare non appena possibile dopo lo svezzamento.

Nel caso di roditori si utilizzeranno almeno 100 animali (50 maschi e 50 femmine) per ogni livello di dose e gruppo di controllo parallelo. Le femmine devono essere nullipare e non gravide. Se si prevede di sacrificare ad intervalli alcuni animali, il numero dovrà essere aumentato del numero di animali che si prevede di sacrificare prima del completamento dello studio.

Livelli di dose e frequenza dell'esposizione

Si dovranno usare almeno tre livelli di dose oltre a un gruppo di controllo parallelo. Il livello di dose più elevato dovrà essere tale da provocare sintomi di tossicità minimi, quali una leggera diminuzione dell'aumento del peso corporeo (meno di 10 %), senza alterare sostanzialmente la durata normale di vita per effetti diversi da quelli dei tumori.

La dose più bassa non dovrà interferire con la crescita, lo sviluppo, e la longevità normali dell'animale né produrre sintomi di tossicità. In generale, essa non dovrà essere inferiore al 10 % della dose più elevata.

La (le) dose(i) intermedia(e) dovrà essere stabilita mediamente tra le dosi elevate e quelle basse.

La scelta dei livelli di dose dovrà prendere in considerazione i dati delle prove e degli studi precedenti di tossicità.

Se il prodotto chimico è somministrato in acqua potabile o mescolato nella dieta, esso dovrà essere continuamente disponibile.

Controlli

Si userà il gruppo di controllo parallelo, che è identico sotto ogni aspetto ai gruppi esposti eccezion fatta per l'esposizione alla sostanza in esame.

In circostanze specifiche, quali ad esempio gli studi di inalazione comportanti impiego di aerosol o gli studi sulla tossicità orale che contemplano l'uso di un emulsionante ad attività biologica atipica, si utilizzerà un gruppo di controllo supplementare non esposto al veicolo.

Vie di somministrazione

Le tre vie principali di somministrazione sono: orale, cutanea e per inalazione. La scelta della via di somministrazione dipende dalle caratteristiche fisiche e chimiche della sostanza da saggiare e dalla via che caratterizza l'esposizione degli esseri umani.

Saggio per via orale

Se la sostanza da saggiare è assorbita dal tratto gastrointestinale, e se la via orale è una via di esposizione degli esseri umani, verrà preferita la via orale di somministrazione, a meno che non vi siano controindicazioni. Gli animali dovranno ricevere la sostanza da saggiare nella loro dieta, sciolta in acqua potabile, o in capsula.

Il dosaggio ideale dovrebbe essere un dosaggio quotidiano sulla base di sette giorni/settimana, perché il dosaggio di cinque giorni/settimana permette il recupero o la perdita di tossicità nel periodo di mancato dosaggio, influenzando così i risultati e la valutazione successiva. Tuttavia, principalmente sulla base di considerazioni pratiche, il dosaggio di cinque giorni/settimana è considerato accettabile.

Saggio per via cutanea

L'esposizione cutanea per spennellamento della pelle può essere scelta per simulare una via principale di esposizione umana e come sistema modello per induzione di lesioni cutanee.

Saggio per via inalatoria

Poiché gli esperimenti di inalazione presentano problemi tecnici di maggior complessità delle altre vie di somministrazione, si forniscono in questa sede indicazioni particolareggiate su questo modo di somministrazione. Da notare inoltre che l'installazione endotracheale può costituire un'alternativa valida in situazioni specifiche.

Le esposizioni a lungo termine sono di solito modellate sui tipi di esposizione umana e sottopongono gli animali ad un'esposizione quotidiana di 6 ore dopo livellamento delle concentrazioni della camera, per 5 giorni/settimana (esposizione intermittente) o, per un'esposizione ambientale possibile, con 22-24 ore di esposizione/giorno, 7 giorni/settimana (esposizione continua), con circa un'ora per nutrire gli animali in orari simili ogni giorno e per il mantenimento delle camere. In entrambi i casi, gli animali di solito sono esposti ad una concentrazione fissa di sostanza da saggiare. Una differenza notevole da considerare tra l'esposizione intermittente e quella continua è costruita dal fatto che con la prima vi è un periodo di 17-18 ore in cui gli animali possono riprendersi dagli effetti di ogni esposizione, e un periodo ancora più lungo di recupero a fine settimana.

La scelta dell'esposizione intermittente o continua dipende dagli obiettivi dello studio e dall'esposizione umana da simulare. Tuttavia, occorrerà considerare alcune difficoltà tecniche. Per esempio, i vantaggi dell'esposizione continua per la simulazione delle condizioni ambientali possono essere compensati dalla necessità di abbeverare o nutrire gli animali durante l'esposizione, e dall'esigenza di usare aerosol più complicati (e affidabili), di generare il vapore e di usare tecniche di controllo.

Camere di esposizione

Gli animali dovranno essere sottoposti a prove in camere di inalazione progettate per sostenere un flusso dinamico di almeno 12 cambiamenti d'aria/ora, per assicurare un tenore di ossigeno adeguato e un'atmosfera ugualmente distribuita. Le camere di esposizione e di controllo dovranno avere costruzioni e progettazioni identiche per assicurare condizioni di esposizione comparabili sotto tutti gli aspetti, eccezion fatta per le esposizioni alle sostanze

da saggiare. Una leggera pressione negativa dentro la camera viene generalmente mantenuta per impedire perdite della sostanza sperimentale nella zona circostante. Nelle camere si dovrà ridurre al massimo l'affollamento degli animali sperimentali. Come regola generale per assicurare la stabilità dell'atmosfera della camera, il volume totale degli animali sperimentali non dovrà superare il 5 % del volume della camera.

Si effettueranno le seguenti misurazioni o controlli:

- i) Corrente d'aria: la portata d'aria attraverso la camera dovrà essere controllata preferibilmente in continuo.
- ii) Concentrazione: durante il periodo di esposizione quotidiana, la concentrazione non dovrà variare di più del $\pm 15\%$ dal valore medio. Per la durata totale dello studio, le concentrazioni giornaliere dovranno essere tenute costanti nella misura del possibile.
- iii) Temperatura ed umidità: per i roditori, la temperatura dovrà essere mantenuta a $22\text{ }^{\circ}\text{C}$ ($\pm 2\text{ }^{\circ}\text{C}$) e l'umidità all'interno della camera al 30-70 %, eccetto quando l'acqua è usata per mantenere in sospensione la sostanza sperimentale nell'atmosfera della camera. Entrambe dovranno essere controllate preferibilmente in continuo.
- iv) Misurazioni delle dimensioni delle particelle: occorrerà effettuare una determinazione della distribuzione dimensionale delle particelle nell'atmosfera delle camere in cui si usino aerosol liquidi o solidi. Le particelle degli aerosol dovranno essere di dimensioni respirabili per gli animali sperimentali usati. I campioni delle atmosfere della camera saranno prelevati nell'area di respirazione degli animali. Il campione dell'aria sarà rappresentativo della distribuzione delle particelle a cui gli animali sono esposti e dovrà rappresentare, su una base gravimetrica, tutto l'aerosol sospeso anche quando gran parte dello stesso non è respirabile. Le analisi granulometriche dovranno essere effettuate di frequente durante la messa a punto del sistema di generazione per assicurare la stabilità dell'aerosol e, in seguito, durante le esposizioni, solo quando necessario, a seconda dei bisogni, per determinare l'uniformità di distribuzione delle particelle a cui gli animali sono stati esposti.

Durata dello studio

La durata di un test di cancerogenesi copre la parte principale della durata normale di vita degli animali sperimentali. La conclusione dello studio sarà dopo 18 mesi per i topi ed i criceti, e dopo 24 mesi per i ratti; tuttavia, per certi ceppi di animali con maggior longevità e tasso poco elevato di tumori spontanei, la conclusione dovrebbe essere dopo 24 mesi per i topi ed i criceti e dopo 30 mesi per i ratti. Alternativamente, la conclusione di un tale studio esteso è accettabile quando la percentuale di superstiti nel gruppo a livello di dose più basso o nel gruppo di controllo raggiunge il 25 %. Allo scopo di terminare lo studio in cui si manifesti una differenza evidente nella risposta, determinata dal sesso, ciascun sesso dovrà essere considerato come un esperimento distinto. Quando solo il gruppo a dose elevata muore prematuramente per ovvie ragioni di tossicità, questa ragione non deve determinare la conclusione dell'esperimento a meno che le manifestazioni tossiche non causino problemi negli altri gruppi. Perché un risultato sperimentale negativo sia accettabile, non più del 10 % di animali di qualsiasi gruppo deve essere perso a causa di autolisi, cannibalismo o altri problemi, e il tasso di sopravvivenza di tutti i gruppi non deve essere inferiore al 50 % a 18 mesi per i topi ed i criceti e a 24 mesi per i ratti.

Procedimento

Osservazioni

Le osservazioni parallele includeranno modificazioni della cute e del pelo, degli occhi e delle mucose nonché del sistema nervoso centrale ed autonomo, di quello respiratorio e circolatorio, dell'attività somatomotoria e del modello comportamentale.

L'osservazione regolare degli animali è necessaria per assicurarsi che gli stessi siano conservati il più possibile per lo studio e non persi a causa di cannibalismo, autolisi dei tessuti o smarrimento. Gli animali moribondi verranno rimossi e sottoposti a necropsia.

Per tutti gli animali si annoteranno i sintomi clinici e la mortalità. Si dedicherà speciale attenzione all'insorgenza dei tumori; si registrerà la data di inizio, la posizione, le dimensioni, l'aspetto e la progressione di ogni tumore grossolanamente visibile o palpabile.

Si procederà settimanalmente alla misurazione del consumo alimentare (e del consumo dell'acqua quando la sostanza sperimentale è somministrata in acqua potabile) durante le prime 13 settimane dello studio e successivamente a intervalli di circa tre mesi a meno che i cambiamenti dello stato di salute o del peso corporeo non impongano altre soluzioni.

Il peso corporeo dovrà essere registrato individualmente per tutti gli animali una volta per settimana durante le prime 13 settimane del periodo di prova ed almeno una volta ogni 4 settimane in seguito.

*Esami clinici**Ematologia*

Se le osservazioni parallele evidenziano un deterioramento nella salute degli animali durante lo studio, si eseguirà un conteggio differenziale del sangue degli animali colpiti.

Dopo 12 mesi, 18 mesi e prima del sacrificio, si farà uno striscio del sangue di tutti gli animali. Un conteggio differenziale del sangue sarà eseguito sui campioni ottenuti dagli animali nel gruppo a dosaggio più elevato e nei controlli. Se i suddetti dati, e in particolare quelli ottenuti prima del sacrificio, o i dati dall'esame patologico ne indicano l'esigenza, si eseguirà il conteggio differenziale del sangue anche per il gruppo(i) trattato con dosaggio immediatamente inferiore.

Esame autoptico di base

L'esame autoptico di base completo dovrà essere eseguito su tutti gli animali, compresi quelli che sono morti durante l'esperimento e quelli moribondi. Si conserveranno tutti i tumori o le lesioni visibili o sospette.

I seguenti organi e tessuti dovranno essere conservati in mezzo adatto per esami istopatologici futuri possibili: tutte le lesioni generali, cervello — comprese sezioni di midollo/ponte, corteccia cerebellare e corteccia cerebrale, pituitaria, tiroide/paratiroide, qualsiasi tessuto timico, trachea e polmoni, cuore, aorta, ghiandole salivari, milza, fegato, reni, ghiandole surrenali, pancreas, gonadi, utero, organi genitali accessori, pelle, esofago, stomaco, duodeno, digiuno, ileo, intestino cieco, colon, retto, vescica urinaria, linfonodi rappresentativi, ghiandole mammarie femminili, muscolatura della coscia, nervo periferico, sterno con midollo osseo, femore — compresa superficie articolare, midollo spinale a tre livelli — cervicale, mediotoracico e lombare, occhi e ghiandole lacrimali esorbitali.

Sebbene l'insufflazione dei polmoni e della vescica urinaria con un fissativo sia il modo ottimale di conservare questi tessuti, l'insufflazione dei polmoni negli studi di inalazione è un requisito necessario per l'esecuzione dell'esame istopatologico appropriato. Negli studi di inalazione, si conserverà tutto il tratto respiratorio, comprese le cavità nasali, le faringi e le laringi.

Esame istopatologico

- a) Esame istopatologico completo degli organi e dei tessuti di tutti gli animali che muoiono o vengono sacrificati durante la prova e di tutti gli animali nei gruppi trattati con dose elevata e nei controlli.
- b) Esame dei tumori o lesioni grossolane visibili o sospette in tutti i gruppi.
- c) Se nei gruppi trattati con dosaggio elevato e nei gruppi di controllo si riscontra una differenza significativa nell'incidenza di lesioni neoplastiche, si eseguirà l'esame istopatologico di quell'organo o tessuto specifico negli altri gruppi.
- d) Se il tasso di sopravvivenza nel gruppo trattato con dosi elevate è significativamente inferiore a quello del gruppo di controllo, il gruppo trattato con dosaggio immediatamente inferiore dovrà essere sottoposto ad esame completo.
- e) Se nel gruppo trattato con dosi elevate si riscontra induzione di tossicità o altri effetti che potrebbero influire sulla risposta neoplastica, si effettuerà un esame completo del gruppo trattato con il dosaggio immediatamente inferiore.

2

DATI

I dati dovranno essere riassunti sotto forma di tabella, indicando per ogni gruppo sperimentale il numero di animali all'inizio della prova, il numero di animali che presentano tumori scoperti durante l'esperimento, la data di individuazione ed il numero di animali in cui si sono riscontrati tumori dopo l'uccisione. I risultati debbono essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

3

RELAZIONE

3.1

Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, origine, condizioni ambientali, dieta, ecc.

- condizioni sperimentali
descrizione dell'apparecchiatura di esposizione, includente
progettazione, tipo, dimensioni, fonte di aria, sistema per generare particelle ed aerosol, metodo di condizionamento dell'aria, trattamento dell'aria di scarico, metodo di alloggiamento degli animali in una camera sperimentale quando questo sistema venga utilizzato. Descrizione del dispositivo per misurare la temperatura, l'umidità e, se del caso, la stabilità delle concentrazioni di aerosol o le dimensioni delle particelle
Dati di esposizione: questi dovranno essere presentati in forma di tabelle con indicazione dei valori medi e una misura della variabilità (ad esempio: deviazione standard) e includeranno
 - a) portata dell'aria attraverso l'attrezzatura di inalazione,
 - b) temperatura ed umidità dell'aria,
 - c) concentrazioni nominali (quantità totale della sostanza sperimentale immessa nell'attrezzatura di inalazione divisa per il volume dell'aria),
 - d) natura del veicolo, se usato,
 - e) concentrazioni reali nella zona sperimentale di respirazione,
 - f) dimensioni delle particelle mediante (se del caso)
- livelli di dose (veicolo compreso, se utilizzato) e concentrazioni,
- dati di incidenza del tumore secondo il sesso, la dose e il tipo di tumore,
- registrazione della data della morte (durante l'esperimento) oppure specificare se gli animali sono sopravvissuti fino alla conclusione della prova,
- dati sulla risposta tossica per sesso e per dose,
- descrizione degli effetti tossici o di altri effetti,
- registrazione della data di osservazione di ogni sintomo anomalo e del decorso successivo,
- alimentazione e dati sul peso corporeo,
- risultati dell'esame ematologico;
- risultati dell'autopsia,
- descrizione particolareggiata di tutti i risultati istopatologici,
- elaborazione statistica dei risultati con descrizione dei metodi impiegati,
- discussione dei risultati,
- interpretazione dei risultati

8.33. SAGGIO COMBINATO DI TOSSICITÀ CRONICA / CANCEROGENESI

1. METODO

1.1. Introduzione

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principio del metodo di saggio

L'obiettivo di un saggio combinato di tossicità cronica / cancerogenesi è quello di determinare gli effetti cronici e cancerogeni di una sostanza di una specie di mammifero in seguito a esposizione prolungata.

Per questo scopo, uno studio di cancerogenesi è integrato con almeno un gruppo satellite trattato e un gruppo satellite di controllo. La dose usata per il gruppo satellite a dose elevata può essere più alta di quella usata per il gruppo a dose elevata nello studio di cancerogenesi. Nello studio di cancerogenesi, gli animali sono esaminati per la tossicità in generale come pure per la risposta cancerogena. Gli animali nel gruppo satellite trattato sono esaminati per la tossicità in generale.

La sostanza in esame è somministrata normalmente 7 giorni per settimana, per una via di somministrazione appropriata, a diversi gruppi di animali da esperimento, una dose per gruppo, per la maggior parte della loro vita. Durante e dopo l'esposizione alla sostanza in esame, gli animali da esperimento vengono osservati ogni giorno per individuare i segni di tossicità e lo sviluppo di tumori.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio

Gli animali sono tenuti nelle condizioni di alloggio e di alimentazione del saggio per almeno 5 giorni prima dell'inizio della prova. Prima dell'esperimento, gli animali giovani e sani vengono mescolati con metodo casuale ed assegnati a gruppi.

Animali da esperimento

La specie preferita è il ratto. Sulla base dei risultati di studi precedentemente svolti, altre specie (roditori o non-roditori) possono essere utilizzate. Si dovrebbero usare i ceppi di animali giovani sani generalmente usati in laboratorio e il dosaggio dovrebbe cominciare non appena possibile dopo lo svezzamento.

All'inizio dello studio, la variazione del peso degli animali usati non dovrebbe superare il $\pm 20\%$ del valore medio. Quando venga intrapreso uno studio subcronico orale come preliminare ad uno studio a lungo termine, si dovrebbe usare la stessa specie e lo stesso ceppo in entrambi gli studi.

Numero e sesso

Per i roditori si dovrebbero usare almeno 100 animali (50 maschi e 50 femmine) per ciascun livello di dose e un gruppo di controllo parallelo. Le femmine dovranno essere nullipare e non gravide. Se si prevedono sacrifici intermedi, il numero dovrebbe essere aumentato del numero di animali che si prevede di sacrificare prima del completamento dello studio.

Il(i) gruppo(i) satellite(i) trattato(i) per la valutazione di patologie diverse dai tumori dovrebbe essere composto da 20 animali di ciascun sesso, mentre il gruppo di controllo satellite dovrà contenere 10 animali di ciascun sesso.

Livelli di dose e frequenza di esposizione

Per gli scopi delle prove di cancerogenesi si dovrebbero usare almeno tre livelli di dose oltre ad un gruppo di controllo parallelo. Il livello di dose più elevato dovrebbe produrre sintomi minimi di tossicità, quale un leggero calo dell'aumento del peso corporeo (meno del 10%), senza alterare sostanzialmente la durata normale di vita a causa di effetti diversi dai tumori.

Il livello di dose più basso non dovrebbe interferire con la crescita normale, lo sviluppo e la longevità dell'animale, né produrre alcuna indicazione di tossicità. Questa dose, in genere, non dovrebbe essere inferiore al 10% della dose elevata. La(e) dose(i) intermedia(e) dovrebbe(ro) essere fissata(e) in un intervallo medio compreso fra la dose elevata e quella bassa. La selezione dei livelli di dose dovrebbe tener conto dei dati derivati dai saggi e dagli studi di tossicità precedenti. Per le finalità del saggio di tossicità cronica, nel saggio vengono inclusi gruppi trattati aggiuntivi e un gruppo di controllo satellite parallelo. La dose elevata per il trattamento degli animali del gruppo satellite dovrà essere tale da produrre evidenti segni di tossicità.

La frequenza dell'esposizione è normalmente quotidiana. Se la sostanza chimica è somministrata nell'acqua da bere o mescolata nella dieta, queste dovrebbero essere continuamente disponibili.

Controlli

Si dovrebbe usare un gruppo parallelo, identico sotto tutti gli aspetti ai gruppi trattati, fatta eccezione per l'esposizione alla sostanza in esame.

In circostanze speciali, quali gli studi di inalazione comportanti l'uso di aerosol o di un emulsionante con attività biologica non caratterizzata mediante studi di tossicità orale, si dovrebbe utilizzare un gruppo di controllo complementare non esposto al veicolo.

Vie di somministrazione

Le tre vie principali di somministrazione sono: orale, cutanea e per inalazione. La scelta della via di somministrazione e funzione delle caratteristiche chimico-fisiche della sostanza in esame e della più probabile via di esposizione degli esseri umani.

Saggi per via orale

Quando la sostanza in esame è assorbita dal tratto gastrointestinale e l'ingestione è una via di esposizione per gli esseri umani, si preferisce la via orale di somministrazione a meno che vi siano controindicazioni. Gli animali possono ricevere la sostanza in esame nella loro dieta, sciolta nell'acqua potabile, o somministrata in capsula.

Idealmente, si dovrebbe usare un dosaggio quotidiano sulla base di sette giorni per settimana, perché il dosaggio di cinque giorni per settimana potrebbe permettere il recupero o una tossicità da privazione nel periodo di mancato dosaggio influenzando così i risultati e la valutazione successiva. Tuttavia, principalmente sulla base di considerazioni pratiche, un dosaggio sulla base di cinque giorni per settimana è considerato accettabile.

Saggi per via cutanea

L'esposizione cutanea con spennellatura della pelle può essere scelta per simulare una principale via di esposizione umana e come sistema modello per induzione di lesioni cutanee.

Saggi per via inalatoria

Poiché i saggi inalatori presentano problemi tecnici di maggior complessità delle altre vie di somministrazione, si forniscono in questa sede indicazioni più particolareggiate su questo modo di somministrazione. Da notare inoltre che l'instillazione endotracheale può costituire un'alternativa valida in situazioni specifiche.

Le esposizioni a lungo termine sono di solito modellate su esposizione umana prevista sottoponendo gli animali ad un'esposizione quotidiana di 6 ore dopo equilibratura delle concentrazioni della camera, per 5 giorni/settimana (esposizione intermittente) o ad un'esposizione ambientale possibile, con 22-24 ore di esposizione/giorno, 7 giorni per settimana (esposizione continua), con circa un'ora per nutrire gli animali allo stesso orario e per la manutenzione della camera. In entrambi i casi, gli animali di solito sono esposti a concentrazioni fisse delle sostanze in esame. Una differenza notevole da considerare tra l'esposizione intermittente e quella continua è costituita dal fatto che con la prima vi è un periodo di 17-18 ore in cui gli animali possono riprendersi dagli effetti di ogni esposizione quotidiana, e un periodo ancora più lungo di recupero durante i fine settimana.

La scelta dell'esposizione intermittente o continua dipende dagli obiettivi dello studio e dall'esposizione umana da simulare. Tuttavia, occorrerà considerare alcune difficoltà tecniche. Per esempio, i vantaggi dell'esposizione continua per la simulazione delle condizioni ambientali possono essere controbilanciati dalla necessità di abbeverare o nutrire gli animali durante l'esposizione, e dall'esigenza di usare aerosol più complicati (e affidabili) e di sistemi di generazione del vapore e di controllo.

Camere di esposizione

Gli animali dovrebbero essere sottoposti a sperimentazione in camere di inalazione progettate per sostenere un flusso dinamico di almeno 12 cambiamenti d'aria/ora, per assicurare un tenore di ossigeno adeguato e un'atmosfera di esposizione uniforme. Le camere di esposizione e di controllo dovrebbero essere identiche nella costruzione e progettazione per assicurare condizioni di esposizione comparabili sotto tutti gli aspetti, eccezion fatta per le esposizioni alle sostanze in esame. Una leggera depressione viene generalmente mantenuta dentro la camera per impedire perdite della sostanza in esame nella zona circostante. Nelle camere si dovrebbe ridurre al massimo l'affollamento degli animali di saggio. Come regola generale per assicurare la stabilità dell'atmosfera della camera, il «volume» totale degli animali di saggio non dovrebbe superare il 5 % del volume della camera.

Si dovrebbero effettuare le seguenti misurazioni o controlli:

- i) Flusso dell'aria: la velocità del flusso dell'aria attraverso la camera dovrebbe essere controllata preferibilmente in modo continuo.
- ii) Concentrazione: durante il periodo di esposizione quotidiana, la concentrazione non dovrebbe variare più del $\pm 15\%$ dal valore medio. Per la durata totale dello studio, le concentrazioni giornaliere dovranno essere tenute costanti nella misura del possibile.
- iii) Temperatura ed umidità: per i roditori, la temperatura dovrà essere mantenuta a $22^\circ\text{C} (\pm 2^\circ\text{C})$ e l'umidità all'interno della camera al 30-70 %, eccetto quando l'acqua è usata per mantenere in sospensione la sostanza sperimentale nell'atmosfera della camera. Entrambe dovrebbero essere controllate preferibilmente in continuo.
- iv) Misura delle dimensioni delle particelle: la distribuzione delle dimensioni delle particelle dovrebbe essere determinata sulle atmosfere di camere che contengono aerosol liquidi o solidi. Le particelle contenute negli aerosol dovrebbero avere dimensioni tali da essere inalabili dall'animale da laboratorio usato. I campioni di atmosfera dovrebbero essere prelevati a livello della zona di respirazione degli animali. Il campione d'aria dovrebbe essere rappresentativo della distribuzione delle particelle a cui gli animali sono esposti e dovrebbe rappresentare, su una base gravimetrica, tutto l'aerosol sospeso anche quando gran parte di esso non è respirabile. Le analisi della grandezza delle particelle dovrebbero essere effettuate spesso durante la messa a punto del sistema di generazione per assicurare la stabilità dell'aerosol e, in seguito, quando si ritenga necessario, durante le esposizioni, per determinare in modo adeguato l'uniformità della distribuzione delle particelle a cui gli animali sono stati esposti.

Durata dello studio

La durata della parte del saggio relativa alla cancerogenesi comprende la maggior parte della vita normale degli animali di saggio. La conclusione del saggio dovrebbe essere a 18 mesi per i topi ed i criceti e dopo 24 mesi per i ratti; tuttavia, per certi ceppi di animali con maggior longevità e/o tasso poco elevato di tumori spontanei, la conclusione dovrebbe essere dopo 24 mesi per i topi ed i criceti e dopo 30 mesi per i ratti. Alternativamente, la conclusione di un tale studio esteso è accettabile quando la percentuale di superstiti nel gruppo a livello di dose più basso o nel gruppo di controllo raggiunge il 25 %. Quando si conclude uno studio in cui si manifesti una differenza evidente nella risposta determinata del sesso, ciascun sesso dovrebbe essere considerato separatamente. Quando solo il gruppo a dose elevata muore prematuramente per ovvie ragioni di tossicità, ciò non deve necessariamente determinare la conclusione dell'esperimento purché le manifestazioni tossiche non causino problemi negli altri gruppi. Perché un risultato sperimentale negativo sia accettabile, non più del 10 % di animali di qualsiasi gruppo può essere perso nell'esperimento a causa di autolisi, cannibalismo o altri problemi, e il tasso di sopravvivenza di tutti i gruppi non deve essere inferiore al 50 % a 18 mesi per i topi ed i criceti e a 24 mesi per i ratti.

I gruppi satelliti di 20 animali (per sesso) sottoposti a dosaggio e i 10 animali (per sesso) di controllo associati, usati per la prova di tossicità cronica, dovrebbero essere mantenuti ai fini dello studio per almeno 12 mesi. Questi animali dovrebbero essere destinati al sacrificio ai fini di un esame della patologia connessa con la sostanza sperimentale non complicata da mutamenti geriatrici.

Procedimento

Osservazioni

Quotidianamente si dovrebbero effettuare osservazioni cliniche che includeranno i mutamenti della cute e del pelo, degli occhi e delle membrane mucose nonché del sistema nervoso centrale ed autonomo, di quello respiratorio e circolatorio, dell'attività somatomotoria e del modello comportamentale.

Un esame clinico dovrebbe essere effettuato a intervalli appropriati sugli animali del(dei) gruppo(i) satellite(i) trattato(i).

Osservazioni regolari degli animali sono necessarie per assicurarsi, per quanto possibile, che gli stessi non siano persi dallo studio a cause quali cannibalismo, autolisi dei tessuti o smarrimento. Gli animali moribondi dovrebbero essere rimossi e sottoposti a necropsia.

Per tutti gli animali si dovrebbero registrare i segni clinici, inclusi i mutamenti neurologici ed oculari nonché la mortalità. Si deve dedicare particolare attenzione allo sviluppo dei tumori, il momento di insorgenza e la progressione delle condizioni tossiche dovrebbero essere registrati.

Si dovrebbe procedere settimanalmente alla misurazione del consumo alimentare (e del consumo dell'acqua quando la sostanza in esame è somministrata in tale veicolo) durante le prime 13 settimane dello studio e poi a intervalli di circa tre mesi a meno che i mutamenti dello stato di salute o del peso corporeo non impongano altre soluzioni.

Il peso corporeo dovrebbe essere registrato individualmente per tutti gli animali una volta per settimana durante le prime 13 settimane del periodo di saggio ed almeno una volta ogni 4 settimane in seguito.

Esami clinici

Ematologia

L'esame ematologico (ad esempio contenuto dell'emoglobina, volume delle cellule impaccate, globuli rossi totali, globuli bianchi totali, piastrine o altre misure del potenziale di coagulazione) dovrebbe essere eseguito dopo 3 mesi, 6 mesi ed approssimativamente a intervalli successivi di 6 mesi ed alla conclusione, sui campioni di sangue raccolti da 10 ratti per sesso di tutti i gruppi. Se possibile, i campioni dovrebbero essere prelevati dagli stessi ratti a ogni intervallo.

Se le osservazioni cliniche suggeriscono un peggioramento nella salute degli animali durante lo studio, si dovrebbe eseguire un conteggio differenziale ematico degli animali colpiti.

Un conteggio differenziale ematico viene eseguito sui campioni provenienti dagli animali appartenenti al gruppo a più elevato dosaggio e nei controlli. I conteggi differenziali del sangue sono eseguiti sul gruppo(i) a dosaggio inferiore immediatamente successivo soltanto se si riscontra una discrepanza notevole tra il gruppo a dosaggio più elevato ed i controlli, o se i risultati dell'esame patologico ne indicano l'esigenza.

Analisi delle urine

Si dovrebbero raccogliere per analisi i campioni di urina di 10 ratti per sesso per tutti i gruppi, se possibile agli stessi intervalli dell'esame ematologico. Le seguenti determinazioni dovrebbero essere fatte o a partire dai diversi animali o su un campione miscelato sesso/gruppo per i roditori:

- aspetto: volume e densità per i singoli animali,
- proteina, glucosio, chetoni, sangue occulto (semiquantitativamente),
- microscopia del deposito (semiquantitativamente)

Chimica clinica

Approssimativamente a intervalli di 6 mesi, ed alla conclusione, si prelevano i campioni di sangue per le misure di chimica clinica da tutti i non-roditori e da 10 ratti per sesso di tutti i gruppi, se possibile dagli stessi ratti a ogni intervallo. Inoltre, si dovrebbe prelevare un campione prima del saggio dai non roditori. Il plasma viene preparato da questi campioni e vengono fatte le seguenti determinazioni:

- concentrazione proteina totale,
- concentrazione dell'albumina,
- saggi di funzionalità epatica (come attività fosfatasi alcalina, glutammico piruvico transaminasi ⁽¹⁾, glutammico-ossalacetico transaminasi ⁽²⁾, gamma-glutamyl transpeptidasi, ornitina decarbossilasi,
- metabolismo dei carboidrati, come glucosio ematico a digiuno,
- saggi di funzionalità renale come azoto ureico

⁽¹⁾ Ora noto come alanina aminotransferasi serica

⁽²⁾ Ora nota come aspartato aminotransferasi serica

Necropsia macroscopica

Tutti gli animali dovrebbero essere sottoposti ad esame necroscopico completo, compresi quelli che sono morti durante l'esperimento a quelli sacrificati perché moribondi. Prima del sacrificio si dovrebbero prelevare campioni di sangue da tutti gli animali per i conteggi differenziali ematici. Si dovrebbero conservare tutte le lesioni e i tumori grossolanamente visibili o sospetti. Si dovrebbe cercare di correlare le osservazioni macroscopiche con i risultati microscopici.

Tutti gli organi e i tessuti dovrebbero essere conservati per l'esame istopatologico. Questo di solito riguarda i seguenti organi e tessuti: cervello ⁽¹⁾ (midollo/ponte, corteccia cerebellare, corteccia cerebrale), pituitaria, tiroide (compresa paratiroide), timo, polmoni (trachea compresa), cuore, aorta, ghiandole salivari, fegato ⁽¹⁾, milza, reni ⁽¹⁾, ghiandole surrenali ⁽¹⁾, esofago, stomaco, duodeno, digiuno, ileo, intestino cieco, colon, retto, utero, vescica urinaria, linfonodi, pancreas, gonadi ⁽¹⁾, organi genitali accessori, ghiandole mammarie femminili, pelle, muscolatura, nervo periferico, midollo spinale (cervicale, toracico, lombare), sterno con midollo osseo e femore (articolazione compresa) e occhi. Sebbene l'insufflazione dei polmoni e della vescica urinaria con un fissativo sia il modo ottimale di conservare questi tessuti, l'insufflazione dei polmoni negli studi di inalazione è un requisito essenziale per l'esame istopatologico appropriato. In studi speciali come quelli dell'inalazione, si dovrebbero studiare tutte le vie respiratorie, compreso naso, faringe e laringe.

Se si eseguono altri esami clinici, le informazioni ottenute con queste procedure dovrebbero essere rese disponibili prima dell'esame microscopico, perché possono fornire indicazioni significative al patologo.

Istopatologia

Per la parte di saggio riguardante la tossicità cronica

Esame particolareggiato da effettuarsi su tutti gli organi conservati di tutti gli animali appartenenti al gruppo satellite trattato con dose elevata e al gruppo di controllo. Quando si riscontra una patologia correlata con la sostanza in esame nel gruppo satellite trattato con dose elevata, gli organi-bersaglio di tutti gli altri animali in un qualsiasi altro gruppo satellite trattato dovrebbero essere sottoposti ad esame istologico completo e particolareggiato insieme con quelli dei gruppi trattati nella parte di cancerogenesi dello studio alla sua conclusione.

Per la parte di saggio riguardante la cancerogenesi

- a) L'esame istopatologico completo dovrebbe essere effettuato sugli organi e tessuti di tutti gli animali che muoiono o che vengono uccisi durante la prova e di tutti gli animali dei gruppi trattati con dose elevata e del gruppo di controllo;
- b) tutti i tumori visibili macroscopicamente o le lesioni sospette di essere di origine tumorale, che si riscontrano in qualsiasi organo di tutti i gruppi di animali dovrebbero essere esaminati microscopicamente;
- c) se si riscontra una differenza significativa nell'incidenza delle lesioni neoplastiche nei gruppi di controllo e in quello trattato con dose elevata, si dovrebbe effettuare l'esame istopatologico su quel particolare organo o tessuto, negli altri gruppi;
- d) se la sopravvivenza nel gruppo trattato con dose elevata è significativamente inferiore a quella del gruppo di controllo, si dovrebbe effettuare un esame completo del gruppo trattato con il dosaggio immediatamente inferiore;
- e) quando si riscontra un'evidenza nel gruppo a dosaggio elevato di induzione di effetti tossici o altri effetti che potrebbero influire su una risposta neoplastica, si dovrebbe procedere ad un esame completo del gruppo trattato con il dosaggio immediatamente inferiore.

2. DATI

I dati dovrebbero essere riassunti sotto forma di tabella, indicando per ogni gruppo di saggio il numero di animali all'inizio della prova, il numero di animali che presentano tumori o effetti tossici riscontrati durante il saggio, il tempo di individuazione ed il numero di animali in cui sono stati individuati tumori dopo il sacrificio. I risultati dovrebbero essere valutati con un metodo statistico appropriato. Qualsiasi metodo statistico riconosciuto può essere utilizzato.

3. RELAZIONE

3.1. Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, origine, condizioni ambientali, dieta, ecc.;

⁽¹⁾ Questi organi, provenienti da 10 animali per sesso e per gruppo (per i roditori) dovrebbero essere pesati

- condizioni sperimentali:
 - descrizione dell'apparecchiatura di esposizione, includente:
 - progettazione, tipo, dimensioni, sorgente d'aria, sistema per generare particelle ed aerosol, metodo di condizionamento dell'aria, trattamento dell'aria di scarico, metodo di alloggiamento degli animali in una camera di saggio quando questa venga utilizzata. Il dispositivo per misurare la temperatura, l'umidità e, se del caso, la stabilità delle concentrazioni di aerosol o le dimensioni delle particelle.
 - dati di esposizione:
 - questi dovranno essere presentati in forma tabulare con indicazione dei valori medi e una misura della variabilità (ad esempio: deviazione standard) ed includere:
 - a) velocità dei flussi dell'aria attraverso l'attrezzatura di inalazione,
 - b) temperature ed umidità dell'aria,
 - c) concentrazioni nominali (quantità totale della sostanza di saggio immessa nell'attrezzatura di inalazione divisa per il volume dell'aria),
 - d) natura di veicolo, se usato,
 - e) concentrazioni reali nella zona sperimentale di respirazione,
 - f) dimensioni mediane delle particelle (se del caso);
- livelli di dose (veicolo compreso, se utilizzato) e concentrazioni,
- dati di incidenza dei tumori secondo il sesso, la dose e il tipo di tumore,
- registrazione del tempo degli eventi letali (durante l'esperimento) oppure specificare se gli animali siano sopravvissuti fino alla conclusione del saggio, incluso gruppo satellite;
- dati sulla risposta tossica per sesso e per dose;
- descrizione degli effetti tossici o di altri effetti;
- registrazione della data di osservazione di ogni sintomo anomalo e del decorso successivo;
- risultati oftalmologici;
- dati su alimentazione e peso corporeo;
- risultati dell'esame ematologico;
- risultati degli esami di biochimica clinica (inclusa qualsiasi analisi delle urine);
- risultati dell'esame necroscopico;
- descrizione particolareggiata di tutti i risultati istopatologici;
- elaborazione statistica dei risultati con descrizione dei metodi impiegati,
- discussione dei risultati;
- interpretazione dei risultati.

1.2 Definizioni

Vedi introduzione generale, parte B

1.3 Sostanza di riferimento

Nessuna

1.4 Principi del metodo di saggio

La sostanza sperimentale è somministrata in dosi graduate a diversi gruppi di animali maschi e femmine. I maschi dovrebbero essere sottoposti a dosaggio durante la crescita e per almeno un ciclo spermatogenico completo (approssimativamente 56 giorni per il topo e 70 giorni per il ratto) per provocare qualsiasi tipo di effetto avverso da parte della sostanza di saggio sulla spermatogenesi.

Le femmine della generazione P dovrebbero essere sottoposte a dosaggio per almeno due cicli estrali completi per suscitare qualsiasi tipo di effetto contrario della sostanza in esame sull'estro. Gli animali sono poi accoppiati. La sostanza in esame viene somministrata ad entrambi i sessi durante il periodo di accoppiamento ed in seguito soltanto alle femmine durante la gravidanza e per la durata del periodo di allattamento. Per la somministrazione della sostanza in esame per via inalatoria, il metodo richiederebbe modifiche.

1.5 Criteri qualitativi

Nessuno.

1.6 Descrizione del metodo di saggio**Preparazioni**

Prima del saggio gli animali giovani e sani sono mescolati con metodo casuale ed assegnati ai gruppi trattati e di controllo. Gli animali sono tenuti nelle condizioni sperimentali di alloggiamento e nutrizione per almeno 5 giorni prima dell'inizio della prova. Si raccomanda di somministrare la sostanza in esame nella dieta o nell'acqua da bere. Sono accettabili anche altre vie di somministrazione. Il dosaggio per tutti gli animali dovrebbe essere fatto con lo stesso metodo durante l'appropriato periodo dell'esperimento. Se un veicolo od altri additivi sono utilizzati per facilitare il dosaggio, essi non dovranno notoriamente produrre effetti tossici. Il dosaggio dovrà essere fatto su una base di sette giorni per settimana.

Animali da esperimento**Scelta della specie**

Il ratto o il topo sono le specie preferite. Si dovrebbero utilizzare animali sani, non sottoposti in precedenza a esperimenti. Non si dovrebbero utilizzare ceppi a bassa fecondità. Gli animali di saggio dovrebbero essere caratterizzati quanto alle specie, al ceppo, al sesso, al peso e all'età.

Per una valutazione adeguata della fertilità, si dovrebbero studiare sia i maschi sia le femmine. Tutti gli animali per il saggio e i controlli dovrebbero essere svezzati prima dell'inizio del dosaggio.

Numero e sesso

Ogni gruppo trattato e di controllo dovrebbe contenere un numero sufficiente di animali per avere circa 20 femmine incinte prossime a partorire o quasi al termine della gravidanza.

L'obiettivo è di avere sufficienti gravidanze e figliate per assicurare una valutazione significativa del potenziale della sostanza di influire negativamente sulla fertilità, sulla gravidanza e sul comportamento materno negli animali della generazione P, e sul lattante, sulla crescita e sullo sviluppo della figliata F₁ dal concepimento allo svezzamento.

Condizioni di saggio

Il cibo e l'acqua dovrebbero essere forniti *ad libitum*. Nell'imminenza del parto, le femmine incinte dovrebbero essere messe in gabbie separate o in gabbie apposite per il parto e possono essere rifornite di materiale per la costruzione della tana.

Livelli di dose

Si dovrebbero usare almeno tre gruppi di trattamento e un gruppo di controllo. Se si usa un veicolo per la somministrazione della sostanza in esame, il gruppo di controllo dovrebbe ricevere il veicolo al livello di dose più alto usato. Se una sostanza in esame provoca una riduzione dell'ingestione o dell'utilizzazione della dieta, si potrebbe considerare necessario l'uso di un gruppo di controllo parallelo. Idealmente, a meno che non sia limitato dalla natura fisico/chimica o dagli effetti biologici della sostanza in esame, il livello di dose più elevato dovrebbe indurre effetti tossici, ma non mortalità nei genitori P. La(e) dose(i) intermedia(e) dovrebbe indurre effetti tossici minimi attribuibili alla sostanza in esame e la dose più bassa non dovrebbe indurre alcun effetto osservabile sui genitori o sulla prole. Quando somministrato con sonda o in capsula, il dosaggio di ogni animale dovrebbe essere basato sul peso corporeo del singolo animale e regolato settimanalmente per tener conto dei cambiamenti del peso corporeo. Per le femmine gravide, i dosaggi possono essere basati sul peso corporeo nel giorno 0 o al 6° giorno di gravidanza.

Saggio limite

Nel caso di sostanze a bassa tossicità, se un livello di dose di almeno 1 000 mg/kg non produce evidenza di interferenza con la funzione riproduttiva, studi con altri livelli di dose possono essere considerati non necessari. Se uno studio preliminare con un livello di dose elevato, con evidenza precisa di tossicità materna, non evidenzia effetti avversi sulla fertilità, studi con altri livelli di dose possono essere considerati non necessari.

Svolgimento del saggio

Programmi sperimentali

Il dosaggio giornaliero dei genitori maschi P dovrebbe cominciare a circa cinque-nove settimane di età, dopo svezzamento e acclimatazione per almeno 5 giorni. Nei ratti, il dosaggio viene continuato per dieci settimane prima del periodo di accoppiamento (per i topi, otto settimane). I maschi dovrebbero essere sacrificati ed esaminati sia alla fine del periodo di accoppiamento oppure, alternativamente, essi possono essere mantenuti con la dieta sperimentale per la possibile produzione di una seconda figliata e dovrebbero essere sacrificati un po' prima della fine dello studio. Per le femmine genitrici P il dosaggio dovrebbe cominciare dopo almeno 5 giorni di acclimatazione e continuare per almeno due settimane prima dell'accoppiamento. Il dosaggio giornaliero delle femmine P dovrebbe continuare durante il periodo di accoppiamento di tre settimane, la gravidanza e fino allo svezzamento della prole F₁. Si dovrebbe dare attenzione a modifiche del programma di dosaggio sulla base di altre informazioni disponibili sulla sostanza in esame, quali l'induzione del suo metabolismo o bioaccumulazione.

Procedura di accoppiamento

Negli studi degli effetti tossici sulla riproduzione si possono usare i seguenti sistemi di accoppiamento: 1:1 (un maschio e una femmina), oppure 1:2 (un maschio e due femmine).

Usando il sistema di accoppiamento 1:1 si dovrebbe mettere una femmina con lo stesso maschio finché la femmina non rimanga gravida o finché non siano trascorse tre settimane. Ogni mattina le femmine dovrebbero essere esaminate per la presenza di sperma o di tappi vaginali. Il giorno 0 di gravidanza è definito come il giorno in cui si trova un tappo vaginale oppure lo sperma.

Le coppie che non riescono ad accoppiarsi dovrebbero essere studiate per determinare la causa della sterilità apparente. Questo può comportare procedure quali, ad esempio, quella di fornire opportunità supplementari di accoppiamento con altri maschi o femmine provati, esame microscopico degli organi riproduttori, e esame del ciclo estrale o della spermatogenesi.

Dimensioni della figliata

Gli animali sottoposti a dosaggio durante lo studio di fertilità vengono lasciati partorire normalmente ed allevare liberamente la prole fino alla fase di svezzamento.

Se si effettua una standardizzazione si suggerisce la seguente procedura. Tra il 1° ed il 4° giorno dopo la nascita, la dimensione di ogni figliata può essere regolata eliminando i piccoli in più, in modo da avere, nella misura del possibile, quattro maschi e quattro femmine per figliata.

Ogni volta che il numero di maschi o di femmine non permette di avere quattro animali di ogni sesso per figliata, è accettabile una regolazione parziale (per esempio, cinque maschi e tre femmine). La standardizzazione non è applicabile alle figliate di meno di otto piccoli.

Osservazioni

Durante tutto il periodo di saggio, ogni animale dovrebbe essere sottoposto ad osservazione almeno una volta al giorno. Si dovrebbero registrare tutte le variazioni comportamentali pertinenti, i segni di parto difficile o prolungato, e tutti i sintomi di tossicità, compresa la mortalità. Nei periodi precedenti e durante l'accoppiamento, il consumo alimentare può essere misurato quotidianamente. Dopo il parto e durante l'allattamento, le misurazioni del consumo di alimento (e del consumo dell'acqua quando la sostanza sperimentale è somministrata in acqua potabile) dovrebbero essere effettuate nello stesso giorno della pesatura delle figlie. I maschi e le femmine P dovrebbero essere pesati nel primo giorno del dosaggio e in seguito settimanalmente. Queste osservazioni dovrebbero essere registrate individualmente per ogni animale adulto.

La durata della gestazione dovrebbe essere calcolata dal giorno 0 di gravidanza. Ogni figliata dovrebbe essere esaminata non appena possibile dopo il parto per stabilire il numero ed il sesso del piccolo, dei nati morti, dei nati vivi e la presenza di grosse anomalie.

I piccolo morti e quelli sacrificati al 4° giorno dovrebbero essere conservati e studiati per la constatazione di possibili difetti.

I piccoli vivi dovrebbero essere contati e le figlie pesate al mattino dopo la nascita, al 4° giorno e al 7° e settimanalmente fino alla conclusione dello studio, quando gli animali dovrebbero essere pesati individualmente. Le anomalie fisiche o comportamentali osservate nei ceppi o nella prole dovrebbero essere registrate.

Patologia

Necropsia

Al momento del sacrificio o della morte durante lo studio, gli animali della generazione P dovrebbero essere esaminati macroscopicamente per l'individuazione di tutte le anomalie strutturali o mutamenti patologici, prestando particolare attenzione agli organi del sistema riproduttivo. I piccolo morti o moribondi dovrebbero essere esaminati per individuare eventuali difetti.

Istopatologia

Le ovaie, l'utero, il collo dell'utero, la vagina, i testicoli, l'epididimo, le vescichette seminali, la prostata, la ghiandola della coagulazione, la ghiandola pituitaria e l'organo(i)-bersaglio di tutti gli animali P dovrebbero essere conservati per l'esame microscopico. Nel caso in cui questi organi non siano stati esaminati in altri studi con dosi multiple, essi dovrebbero essere esaminati microscopicamente in tutti gli animali dei gruppi trattati con dose elevata e di controllo e negli animali che muoiono durante l'esperimento, quando fattibile.

Gli organi di questi animali che mostrano anomalie dovrebbero quindi essere esaminati in tutti gli altri animali P. In questi casi, si dovrebbe eseguire l'esame microscopico di tutti i tessuti che mostrano alterazioni patologiche macroscopiche. Come suggerito per le procedure di accoppiamento, gli organi riproduttivi degli animali sospetti di sterilità possono essere sottoposti all'esame microscopico.

2. DATI

I dati possono essere riassunti sotto forma di tabella, indicando per ogni gruppo sperimentale il numero di animali all'inizio del saggio, il numero di maschi fertili, il numero di femmine incinte, i tipi di cambiamenti e la percentuale degli animali che mostrano ciascun tipo di cambiamento. Quando possibile, i risultati numerici dovrebbero essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico generalmente riconosciuto può essere utilizzato.

3. RELAZIONE

3.1 Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- specie/ceppo usato,
- dati sulla risposta tossica per sesso e per dose, compresa la fertilità, la gestazione normale e la vitalità,

- tempo di morte durante lo studio o, se gli animali sono sopravvissuti fino al tempo previsto per il sacrificio, alla conclusione dello studio,
- tabella indicante i pesi di ogni figliata, il peso medio dei piccoli ed i pesi individuali dei piccoli a termine,
- effetti tossici o altri effetti sulla riproduzione, sulla prole, sulla crescita postnatale,
- data di osservazione di ogni segno anormale e decorso successivo,
- dati sul peso corporeo degli animali P,
- risultati della microscopia,
- descrizione particolareggiata di tutti i risultati degli esami microscopici,
- elaborazione statistica dei risultati, quando appropriata,
- discussione dei risultati,
- interpretazione dei risultati

La sostanza in esame è somministrata in dosi graduate a diversi gruppi di animali maschi e femmine. I maschi della generazione P dovrebbero essere sottoposti a dosaggio durante la crescita per almeno un ciclo spermatogenico completo (approssimativamente 56 giorni nel topo e 70 giorni nel ratto) affinché la sostanza in esame provochi ogni effetto contrario sulla spermatogenesi.

Le femmine della generazione P dovrebbero essere dosate per almeno due cicli estrali completi perché la sostanza in esame provochi ogni effetto contrario sull'estro. Allo svezzamento, la somministrazione della sostanza viene continuata sulla prole F₁ durante la crescita fino all'età adulta, durante l'accoppiamento e la produzione di una generazione F₂, e finché la generazione F₂ sia svezzata. Per la somministrazione per inalazione della sostanza sperimentale, il metodo richiederà modifiche.

1.5 Criteri qualitativi

Nessuno.

1.6 Descrizione del metodo di saggio**Preparazioni**

Prima della prova, gli animali sani sono mescolati con metodo casuale ed assegnati ai gruppi trattati e di controllo. Gli animali genitori P sono tenuti nelle condizioni sperimentali di alloggiamento e nutrizione per almeno 5 giorni prima della prova. Si raccomanda di somministrare la sostanza in esame nella dieta o nell'acqua da bere. Sono accettabili anche altre vie di somministrazione. Tutti gli animali dovrebbero essere dosati con lo stesso metodo durante l'intero periodo sperimentale. Se un veicolo od altri additivi sono utilizzati per facilitare il dosaggio, essi non dovrebbero notoriamente produrre effetti tossici. Il dosaggio dovrebbe essere effettuato su una base di sette giorni per settimana.

Animali da esperimento: scelta della specie

Il ratto o il topo sono le specie preferite. Si dovrebbero usare animali sani P, non sottoposti a esperimenti in precedenza. Non si dovrebbero usare ceppi a bassa fecondità. Gli animali da laboratorio dovrebbero essere caratterizzati quanto alla specie, al ceppo, al sesso, al peso e/o all'età.

Per un'adeguata valutazione della fertilità, si dovrebbero studiare sia i maschi che le femmine. Tutti gli animali del gruppo di saggio e di quello di controllo dovrebbero essere svezzati prima dell'inizio del dosaggio.

Numero e sesso

Ogni gruppo di saggio e di controllo dovrebbe contenere un numero sufficiente di animali perché vi siano circa 20 femmine incinte o al termine della gravidanza. L'obiettivo è di avere sufficienti gravidanze e prole per assicurare una valutazione significativa del potenziale della sostanza di influire negativamente sulla fertilità, sulla gravidanza.

sul comportamento materno e sul lattante, sulla crescita e sullo sviluppo della prole F_1 , dal concepimento alla maturità, e lo sviluppo della loro prole F_2 fino allo svezzamento

Condizioni sperimentali

Il cibo e l'acqua dovrebbero essere forniti ad libitum. Nell'imminenza del parto, le femmine incinte dovrebbero essere messe in gabbie separate o in gabbie apposite per il parto e possono essere rifornite di materiale per la costruzione della tana.

Livelli di dose

Si dovrebbero usare almeno tre gruppi di trattamento e un gruppo di controllo. Se si usa un veicolo per la somministrazione della sostanza in esame, il gruppo di controllo dovrebbe ricevere il veicolo al livello di dose più elevato usato. Se una sostanza in esame produce una riduzione dell'ingestione o dell'utilizzazione della dieta, si potrebbe considerare necessario l'uso di un gruppo di controllo parallelo. Idealmente, a meno che non sia limitato dalla natura fisico/chimica o dagli effetti biologici della sostanza in esame, il livello di dose più elevato dovrebbe indurre effetti tossici, ma non mortalità nei genitori P. La dose(i) intermedia(e) dovrebbe(ro) indurre effetti tossici minimi attribuibili alla sostanza di saggio e la dose più bassa non dovrebbe indurre effetti contrari osservabili sui genitori o sulla prole. Quando somministrato con sonda o in capsula, il dosaggio di ogni animale dovrebbe essere basato sul peso corporeo del singolo animale e regolato settimanalmente per tener conto dei cambiamenti del peso corporeo. Per le femmine gravide, i dosaggi possono essere basati sul peso corporeo al giorno 0 o al 6° giorno di gravidanza, se lo si desidera.

Saggio limite

Nel caso di sostanze a bassa tossicità, se un livello di dose di almeno 1 000 mg/kg non produce sintomi di interferenza con la funzione riproduttiva, studi con altri livelli di dose possono essere considerati non necessari. Se uno studio preliminare con un livello di dose elevato, con evidenza precisa di tossicità materna, non evidenzia effetti avversi sulla fertilità, studi con altri livelli di dose possono essere considerati non necessari.

Svolgimento del saggio

Programmi sperimentali

Il dosaggio giornaliero dei genitori maschi P dovrebbe cominciare a circa cinque-nove settimane di età, dopo svezzamento e acclimatazione per almeno 5 giorni. Nei ratti, il dosaggio viene continuato per dieci settimane prima del periodo di accoppiamento (per i topi, otto settimane). I maschi dovrebbero essere sacrificati ed esaminati sia alla fine del periodo di accoppiamento oppure, alternativamente, essi possono essere mantenuti con la dieta sperimentale per la possibile produzione di una seconda figliata e dovrebbero essere sacrificati ed esaminati un po' prima della fine dello studio. Per le femmine genitrici P il dosaggio dovrebbe cominciare dopo almeno 5 giorni di acclimatazione e continuare per almeno due settimane prima dell'accoppiamento. Il dosaggio giornaliero delle femmine P dovrebbe continuare durante il periodo di accoppiamento di tre settimane, la gravidanza e fino allo svezzamento della prole F_1 . Si dovrebbe porre attenzione a modifiche del programma di dosaggio sulla base di altre informazioni disponibili sulla sostanza in esame, quali l'induzione del suo metabolismo o bioaccumulazione.

Il dosaggio degli animali F_1 comincia allo svezzamento e termina quando essi vengono sacrificati.

Procedura di accoppiamento

Negli studi degli effetti tossici sulla riproduzione si possono usare i seguenti sistemi di accoppiamento: 1:1 (un maschio e una femmina), oppure 1:2 (un maschio e due femmine).

Usando il sistema di accoppiamento 1:1 si dovrebbe mettere una femmina con lo stesso maschio finché la femmina non rimanga gravida o finché non siano trascorse tre settimane. Ogni mattina le femmine dovrebbero essere esaminate per la presenza di sperma o di tappi vaginali. Il giorno 0 di gravidanza è definito come il giorno in cui si trova un tappo vaginale oppure lo sperma.

Tenendo conto della spermatogenesi, la prole F_1 non dovrebbe essere accoppiata fino all'età di almeno 11 settimane per i topi, e di 13 settimane per i ratti. Per l'accoppiamento della prole F_1 , un maschio ed una femmina sono scelti con metodo casuale tra ogni figliata per accoppiamento incrociato con un animale di un'altra figliata dello stesso gruppo di dosaggio, per produrre la generazione F_2 . I maschi e le femmine F_1 non scelti per l'accoppiamento sono sacrificati allo svezzamento.

Le coppie che non riescono ad accoppiarsi dovrebbero essere studiate per determinare la causa della sterilità apparente. Questo può comportare procedure quali, ad esempio, quella di fornire opportunità supplementari di accoppiamento con altri maschi o femmine provati, esame microscopico degli organi riproduttivi, e esame del ciclo estrale o della spermatogenesi.

Dimensioni della figliata

Gli animali sottoposti a dosaggio durante lo studio di fertilità vengono lasciati partorire normalmente ed allevare liberamente la prole fino alla fase di svezzamento.

Se si effettua una standardizzazione, si suggerisce la seguente procedura. Tra il 1° ed il 4° giorno dopo la nascita, la dimensione di ogni figliata può essere regolata eliminando i piccoli in più, in modo da avere, nella misura del possibile quattro maschi e quattro femmine per figliata.

Ogni volta che il numero di maschi o di femmine non permette di avere quattro animali di ogni sesso per figliata, è accettabile una regolazione parziale (per esempio, cinque maschi e tre femmine). La normalizzazione non è applicabile alle figliate di meno di otto piccoli. La standardizzazione delle figliate F_2 è condotta nello stesso modo.

Osservazioni

Durante tutto il periodo di saggio, ogni animale dovrebbe essere sottoposto ad osservazione almeno una volta al giorno. Si dovrebbero registrare tutte le variazioni comportamentali pertinenti, i segni di parto difficile o prolungato, e tutti i sintomi di tossicità, compresa la mortalità. Nei periodi precedenti e durante l'accoppiamento, il consumo alimentare può essere misurato settimanalmente. A scelta, il consumo alimentare durante la gravidanza potrà essere misurato ogni giorno. Dopo il parto e durante la lattazione, le misurazioni del consumo di alimento dovrebbero essere effettuate nello stesso giorno della pesatura delle figliate. Gli animali genitori (P ed F_1) dovrebbero essere pesati nel primo giorno del dosaggio e in seguito settimanalmente. Queste osservazioni dovrebbero essere registrate individualmente per ogni animale adulto.

La durata della gestazione dovrebbe essere calcolata dal giorno 0 di gravidanza. Ogni figliata dovrebbe essere esaminata non appena possibile dopo il parto per stabilire il numero ed il sesso dei piccoli, dei nati morti, dei nati vivi e la presenza di grosse anomalie. I piccoli morti e quelli sacrificati al 4° giorno dovrebbe essere conservati per la constatazione di possibili difetti.

Si dovrebbero contare i nati vivi e procedere alla pesatura delle figliate il mattino dopo la nascita, poi il 4° e il 7° giorno e quindi settimanalmente fino al termine dell'esperimento quando gli animali dovrebbero essere pesati individualmente. Si dovrebbero registrare le anomalie comportamentali delle genitrici e della prole.

Patologia

Necropsia

Tutti gli animali adulti P ed F_1 dovrebbero essere sacrificati quando non più necessari per valutare gli effetti riproduttivi. La prole F_1 non selezionata per l'accoppiamento e tutta la prole F_2 dovrebbe essere sacrificata una volta svezzata.

Al momento del sacrificio o della morte durante lo studio, tutti gli animali genitori (P ed F_1) dovrebbero essere esaminati microscopicamente per l'individuazione di tutte le anomalie strutturali o le mutazioni patologiche, dedicando particolare attenzione agli organi del sistema riproduttivo. I piccoli morti o moribondi dovrebbero essere esaminati per individuare eventuali anomalie.

Istopatologia

Le ovaie, l'utero, il collo dell'utero, la vagina, i testicoli, l'epididimo, le vescichette seminali, la prostata, la ghiandola della coagulazione, la ghiandola pituitaria e l'organo(i)-bersaglio di tutti gli animali P dovrebbero essere conservati per l'esame microscopico. Nel caso in cui questi organi non siano stati esaminati in altri studi con dosi multiple, essi dovrebbero essere esaminati microscopicamente in tutti gli animali dei gruppi trattati con dose elevata e di controllo e negli animali che muoiono durante l'esperimento, quando fattibile. Gli organi che mostrano anomalie in questi animali dovrebbero quindi essere esaminati in tutti gli altri gruppi di dose. In questi casi, si dovrebbe eseguire l'esame microscopico di tutti i tessuti che mostrano alterazioni patologiche macroscopiche. Come suggerito per le procedure di accoppiamento, gli organi riproduttivi degli animali sospetti di sterilità possono essere sottoposti all'esame microscopico.

2. DATI

Elaborazione dei risultati

I dati possono essere riassunti sotto forma di tabella, indicando per ogni gruppo sperimentale il numero di animali all'inizio del saggio, il numero di animali gravidi, i tipi di cambiamenti e la percentuale degli animali che mostrano ciascun tipo di cambiamento.

Quando possibile, i risultati numerici dovrebbero essere valutati con un metodo statistico idoneo. Qualsiasi metodo statistico generalmente accettato può essere utilizzato.

3. RELAZIONE

3.1. Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- specie/ceppo usato,
- dati sulla risposta tossica per sesso e per dose, inclusi gli indici di fertilità, gestazione e vitalità,
- tempo di morte durante lo studio o se gli animali sono sopravvissuti fino alla conclusione dello studio,
- tabella indicante i pesi di ogni figliata, il peso medio dei piccoli ed i pesi individuali dei piccoli a termine,
- effetti tossici o altri effetti sulla riproduzione, sulla prole, sulla crescita postnatale,
- data di osservazione di ogni segno anomalo e decorso successivo,
- dati sul peso corporeo degli animali P e F₁,
- risultati della microscopia,
- descrizione particolareggiata di tutti i risultati degli esami microscopici,
- elaborazione statistica dei risultati, quando appropriata,
- discussione dei risultati,
- interpretazione dei risultati.

3.2. Valutazione ed interpretazione

Vedi introduzione generale, parte B.

4. RIFERIMENTI

Vedi introduzione generale, parte B.

B.36. TOSSICOCINETICA

1 METODO

1.1. Introduzione

Vedi introduzione generale, parte B.

1.2. Definizioni

Vedi introduzione generale, parte B.

1.3. Sostanze di riferimento

Nessuna.

1.4. Principi del metodo di saggio

Si somministra la sostanza in esame per una via appropriata. In relazione agli obiettivi dello studio, la sostanza può essere somministrata, in dose singola o in dosi ripetute nel corso di periodi di tempo definiti, a uno o più gruppi di animali da esperimento. Successivamente, in relazione al tipo di studio effettuato, si determinano la sostanza e/o i suoi metaboliti nei fluidi corporei e nei tessuti e/o negli escreti.

Gli studi possono essere effettuati con forme «non marcate» o «marcate» delle sostanze in esame. Quando è fatto uso di un marcatore, è opportuno che esso sia collocato nella sostanza in maniera tale da fornire la maggior quantità possibile di informazioni sul destino del composto.

1.5. Criteri qualitativi

Nessuno.

1.6. Descrizione del metodo di saggio

Preparazioni

Si acclimatano alle condizioni del laboratorio per almeno cinque giorni prima del saggio animali adulti sani e giovani. Prima del saggio gli animali vengono mischiati con metodo casuale ed assegnati ai gruppi destinati ai trattamenti. In situazioni speciali possono essere usati animali molto giovani, femmine gravide o pretrattati.

*Condizioni sperimentali**Animali da esperimento*

Gli studi tossicocinetici possono essere effettuati su una o più specie animali appropriate, e dovrebbero tenere conto delle specie usate o che si pensa di usare per altri studi tossicologici sulla medesima sostanza in esame. Quando in un saggio si fa uso di ratti, la variazione del peso corporeo non dovrebbe essere maggiore del $\pm 20\%$ del peso medio.

Numero e sesso

Per gli studi di assorbimento e di escrezione sarebbe opportuno che in ciascun gruppo di dose vi siano inizialmente quattro animali. Una preferenza per l'uno o l'altro sesso non è imperativa, ma in determinate circostanze può essere necessario studiare entrambi i sessi. Se vi sono differenze di risposta secondo i sessi, quattro individui per sesso dovrebbero essere sottoposti al saggio. Nel caso di studi su animali diversi dai roditori può essere usato un numero minore di individui.

Quando si studia la distribuzione nei tessuti, la grandezza del gruppo iniziale dovrebbe tenere conto sia del numero degli animali da sacrificare in ciascuna fase che del numero delle fasi da considerare.

Negli studi del metabolismo le dimensioni del gruppo sono in relazione con le esigenze specifiche dello studio. Per gli studi con dosi multiple e in fasi multiple, le dimensioni del gruppo dovrebbero tenere conto del numero sia delle fasi che dei sacrifici in programma, e in ogni caso il gruppo non deve comprendere meno di due animali. Le dimensioni del gruppo dovrebbero essere sufficienti per fornire una caratterizzazione accettabile dell'assorbimento, del plateau e della deplezione (a seconda del caso considerato) della sostanza in esame e/o dei suoi metaboliti.

Livelli di dosaggio

Nel caso della somministrazione in un'unica dose almeno due livelli di dosaggio dovrebbero essere usati. Vi dovrebbero essere una dose bassa, alla quale non si osservano effetti tossici, e una dose elevata, alla quale vi possono essere cambiamenti dei parametri tossicocinetici o si manifestano effetti tossici.

Nel caso della somministrazione di dosi ripetute la dose bassa è normalmente sufficiente, ma in determinate circostanze può essere necessaria anche una dose alta.

Vie di somministrazione

Gli studi tossicocinetici dovrebbero essere effettuati facendo uso della stessa via e, se del caso, dello stesso veicolo usato, o che si pensa di usare negli altri studi di tossicità. La sostanza in esame è normalmente somministrata per via orale mediante sonda gastrica o nella dieta, o è applicata alla cute, o somministrata per inalazione per periodi di tempo definiti a gruppi di animali da esperimento. Per la determinazione dell'assorbimento relativo per altre vie può essere utile la somministrazione della sostanza in esame per via endovenosa. Entro breve tempo della somministrazione endovenosa di una sostanza è inoltre possibile ottenere utili informazioni sul suo profilo di distribuzione.

Si dovrebbe tener presente la possibilità di un'interferenza fra il veicolo e la sostanza in esame. Si dovrebbe fare attenzione alle differenze di assorbimento fra la somministrazione della sostanza in esame per sonda gastrica e rispettivamente nell'alimentazione, ed all'esigenza di una determinazione precisa della dose, specialmente quando la sostanza in esame viene somministrata con la dieta.

Periodo di osservazione

Tutti gli animali dovrebbero essere osservati quotidianamente, e dovrebbe essere presa nota di tutti i segni di tossicità e degli altri elementi clinici rilevanti, ivi compresi il momento dell'insorgenza, il grado e la durata.

Procedimento

Dopo la pesatura degli animali di saggio si somministra per una via appropriata la sostanza in esame. Se lo si considera importante, gli animali possono essere tenuti a digiuno prima della somministrazione della sostanza in esame.

Assorbimento

La velocità e l'entità dell'assorbimento della sostanza somministrata possono essere valutate secondo diversi metodi, con o senza gruppi di riferimento⁽¹⁾, ad esempio:

- attraverso la determinazione della quantità della sostanza in esame e/o dei suoi metaboliti negli escreti, quali l'urina, la bile, le feci e l'aria inspirata, e della quantità che rimane nella carcassa;
- attraverso il raffronto della risposta biologica (ad esempio negli studi della tossicità acuta) fra i gruppi sottoposti al saggio e i gruppi di controllo e/o di riferimento;
- attraverso il raffronto della quantità di sostanza e/o di metabolita escreta per via renale nei gruppi sottoposti al saggio e in gruppi di riferimento;
- attraverso la determinazione dell'area al di sotto della curva del livello plasmatico in funzione del tempo della sostanza in esame e/o dei suoi metaboliti, e attraverso il raffronto con i dati di un gruppo di riferimento.

⁽¹⁾ In questo metodo un gruppo di riferimento è un gruppo nel quale la sostanza in esame è somministrata per un'altra via che permette la disponibilità completa della dose.

Distribuzione

Sono attualmente disponibili due procedure che possono essere usate insieme o separatamente per le analisi dei profili di distribuzione:

- un'utile informazione qualitativa si ottiene facendo uso di tecniche autoradiografiche su tutto il corpo,
- un'informazione quantitativa si ottiene sacrificando gli animali a intervalli diversi dopo l'esposizione e determinando la concentrazione e la quantità della sostanza in esame e/o dei suoi metaboliti nei tessuti e negli organi.

Escrezione

Negli studi di escrezione si raccolgono l'urina, le feci e l'aria espirata e, in determinate circostanze, la bile. La quantità della sostanza in esame e/o dei suoi metaboliti dovrebbe essere misurata in detti escreti ad intervalli diversi dopo l'esposizione, fino a che sia stato escreto intorno al 95 % della dose somministrata, ovvero per sette giorni, secondo la condizione che si verifica per prima.

In casi speciali può essere necessario considerare l'escrezione della sostanza in esame nel latte degli animali da esperimento che allattano i piccoli.

Metabolismo

Per determinare l'estensione e il profilo del metabolismo si dovrebbero analizzare campioni biologici secondo tecniche appropriate. Se vi è la necessità di dare risposta a quesiti derivanti da studi tossicologici precedenti si dovrebbero chiarire le strutture dei metaboliti e proporre vie metaboliche appropriate. Per ottenere informazioni sulle vie metaboliche può essere proficuo effettuare studi in vitro.

Ulteriori informazioni sulle relazioni fra il metabolismo e la tossicità possono essere ottenute da studi biochimici, quali la determinazione degli effetti sui sistemi di enzimi metabolizzanti, sulla deplezione dei composti sulfidrilici endogeni non proteici e sull'unione della sostanza con macromolecole.

2. DATI

In relazione al tipo di studio effettuato i dati dovrebbero essere riassunti in forma di tabella integrata se del caso da rappresentazioni grafiche. Per ciascun gruppo di saggio dovrebbero essere poste in evidenza, in tutti i casi in cui ciò è possibile, le variazioni medie e statistiche delle misurazioni in relazione al tempo, al dosaggio, ai tessuti e agli organi. L'entità dell'assorbimento e la quantità e la velocità dell'escrezione dovrebbero essere determinate con metodi appropriati. Quando si effettuano studi del metabolismo, la struttura dei metaboliti identificati dovrebbe essere data e le possibili vie metaboliche presentate.

3. RELAZIONE

3.1 Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- specie, ceppo, provenienza, condizioni ambientali, dieta,
- caratterizzazione di eventuali materiali marcati,
- livelli di dosaggio e intervalli usati,
- via o vie di somministrazione ed ogni veicolo usato,
- effetti tossici ed altri effetti osservati,
- metodi per la determinazione della sostanza in esame e/o dei suoi metaboliti nei campioni biologici, ivi compresa l'aria espirata,
- presentazione in forma tabulare delle misurazioni per sesso, dose regime, tempo, tessuti ed organi,
- presentazione dell'entità dell'assorbimento e dell'escrezione nel tempo.

- metodi per la caratterizzazione e l'identificazione di metaboliti nei campioni biologici,
- metodi per le misurazioni biochimiche concernenti il metabolismo,
- vie proposte per il metabolismo,
- discussione dei risultati,
- interpretazione dei risultati.

3.2. Valutazione e interpretazione

Vedi introduzione generale, parte B.

4 RIFERIMENTI

Vedi introduzione generale, parte B.

•B.37 NEUROTOSSICITÀ RITARDATA DI SOSTANZE ORGANOFOSFORICHE DOPO ESPOSIZIONE ACUTA

1 METODO

1.1 Introduzione

Per la valutazione degli effetti tossici delle sostanze è importante tener conto della facoltà di talune classi di sostanze di indurre effetti neurotossici specifici che potrebbero non essere messi in luce da altri studi di tossicità. Alcune sostanze organofosforiche, che hanno evidenziato una neurotossicità ritardata, dovrebbero essere oggetto di una valutazione in questo senso.

Saggi preliminari in vitro consentono di identificare le sostanze suscettibili di indurre una polineuropatia ritardata; tuttavia risultati di studi in vitro non garantiscono l'assenza di neurotossicità della sostanza saggiata.

Vedi introduzione generale, parte B.

1.2 Definizioni

Le sostanze organofosforiche comprendono esteri, tioesteri o anidridi organofosforici neutri degli acidi organofosforici, organofosfonici o organofosforamidici o dei corrispondenti acidi fosforotioici, fosfonotioici o fosforotioamidici, o altre sostanze suscettibili di indurre gli effetti neurotossici ritardati talvolta osservati in questa classe di sostanze.

La neurotossicità ritardata è una sindrome associata ad atassia prolungata a comparsa tardiva, ad assonopatie distali del midollo spinale e dei nervi periferici e ad un'inibizione e un'invecchiamento dell'esterasi suggestiva di neuropatia (NTE, neuropathy target esterase) nei tessuti nervosi.

1.3 Sostanze di riferimento

Una sostanza di riferimento può essere saggiata in un gruppo di controllo positivo al fine di dimostrare che, nelle condizioni sperimentali utilizzate, la reazione delle specie esaminate non ha subito variazioni significative.

Una sostanza neurotossica di comune utilizzo è il tri-*o*-tolil fosfato [CAS 78-30-8, EINECS 201-103-5, nomenclatura CAS: acido fosforico, tris (2-metilfenil)estere], noto anche come tris-*o*-cresil fosfato.

1.4 Principio del metodo di saggio

La sostanza in esame viene somministrata per via orale in un'unica dose a galline eventualmente protette contro effetti colinergici acuti. Gli animali vengono tenuti in osservazione per 21 giorni al fine di individuare eventuali anomalie del comportamento, atassia e paralisi. A 24 e 48 ore di distanza dalla somministrazione vengono effettuate analisi biochimiche, e in particolare l'inibizione della NTE, su galline selezionate da ciascun gruppo secondo un criterio di casualità. Ventun giorni dopo l'esposizione si sopprimono gli animali superstiti e si procede all'esame istopatologico di determinati tessuti nervosi.

1.5 Descrizione del metodo di saggio

1.5.1 Preparazioni

Galline adulte, giovani e sane, che non presentino affezioni virali e non siano trattate con farmaci suscettibili di alterare i risultati del saggio, nonché esenti da turbe della deambulazione, vengono assegnate in modo casuale a gruppi da trattare e di controllo e acclimatate alle condizioni di laboratorio per almeno 5 giorni prima dell'inizio del saggio.

Le gabbie o i recinti saranno sufficientemente ampi affinché gli animali possano muoversi liberamente ed essere facilmente osservati durante la deambulazione.

Di norma la sostanza in esame viene somministrata per via orale tramite sonda gastrica, capsule di gelatina o un metodo analogo. Le sostanze liquide possono essere somministrate non diluite o disciolte in un veicolo appropriato, quale l'olio di mais. Se possibile, si avrà cura di sciogliere le sostanze solide, in quanto dosi elevate di tali sostanze in capsule di gelatina possono non essere completamente assorbite. Per i veicoli non acquosi, le caratteristiche di tossicità del veicolo dovranno essere note o, in caso contrario, determinate prima del saggio.

1 5 2 *Condizioni sperimentali*1 5 2 1 *Animali da esperimento*

Si utilizzeranno di preferenza galline domestiche ovaiole (*Gallus gallus domesticus*), giovani e adulte, di età compresa tra 8 e 12 mesi, appartenenti a razze e a ceppi di taglia standard. Gli animali saranno allevati in condizioni che ne garantiscano la libertà di movimento.

1 5 2 2 *Numero e sesso*

Oltre al gruppo da trattare, si utilizzeranno un gruppo di controllo positivo ed uno con somministrazione del solo veicolo. Quest'ultimo sarà trattato in modo identico al primo, tranne per il fatto che agli animali non verrà somministrata la sostanza in esame.

Ogni gruppo dovrà comprendere un numero sufficiente di animali, in modo che almeno sei esemplari possano essere soppressi per effettuare le analisi biochimiche (tre a 24 ore e tre a 48 ore di distanza dalla somministrazione) ed altri sei possano sopravvivere per i 21 giorni del periodo di osservazione.

Il gruppo di controllo positivo può essere attuale o appartenere a studi recentemente effettuati. Esso comprenderà almeno sei animali trattati con una sostanza neurotossica nota ad effetto ritardato, tre dei quali saranno destinati alle analisi biochimiche e tre all'osservazione. È opportuno procedere ad un aggiornamento periodico dei dati storici. Nuovi dati di controllo positivo dovranno essere elaborati ogniqualvolta venga modificato un elemento essenziale del saggio (quale il ceppo, il tipo di alimentazione o le condizioni di alloggiamento degli animali).

1 5 2 3 *Livelli di dosaggio*

Per la determinazione del livello di dosaggio da utilizzare nello studio principale si procederà ad uno studio preliminare su un numero adeguato di animali suddivisi in gruppi trattati con diversi livelli di dosaggio. Per una corretta definizione di detto parametro sono generalmente necessari in questa fase preliminare, un certo numero di decessi. Tuttavia, al fine di evitare decessi cagionati da effetti colinergici acuti, si potrà fare ricorso ad atropina o ad un altro agente protettivo che non sia suscettibile di interferire con eventuali reazioni neurotossiche ritardate. Esistono diversi modi per la determinazione della dose massima non letale di una sostanza (vedi metodo B 1 bis). Anche i dati di precedenti studi su galline o altre informazioni tossicologiche possono essere utili a questo scopo.

Il livello di dosaggio da utilizzare nello studio principale deve essere il più elevato possibile tenendo conto dei risultati ottenuti nello studio preliminare per la determinazione del dosaggio e del limite massimo di 2.000 mg/kg peso corporeo. Indipendentemente dal tasso di mortalità, è indispensabile che un numero sufficiente di animali sopravviva per l'esecuzione delle analisi biochimiche (sei) e dell'esame istologico del ventunesimo giorno (sei). Per evitare decessi cagionati da effetti colinergici acuti, si potranno somministrare atropina o un analogo agente protettivo che non sia suscettibile di interferire con eventuali reazioni neurotossiche ritardate.

1 5 2 4 *Saggio limite*

Qualora un saggio, effettuato in conformità con il metodo descritto, con un livello di dosaggio di almeno 2.000 mg/kg di peso corporeo/giorno, non produca effetti tossici evidenti e se i dati relativi a sostanze di struttura affine non sono suggestivi di tossicità, può non essere necessario somministrare un dosaggio superiore. Il saggio limite è giustificato, salvo nel caso in cui l'esposizione umana comporti la necessità di utilizzare un più elevato livello di dosaggio.

1 5 2 5 *Periodo di osservazione*

Il periodo di osservazione avrà una durata di 21 giorni.

1 5 3 *Procedimento*

Dopo aver trattato gli animali con un agente protettivo atto a prevenire effetti colinergici acuti potenzialmente letali, si somministra la sostanza in esame in una singola dose.

1 5 3 1 *Osservazioni generali*

Il periodo di osservazione inizia subito dopo l'esposizione alla sostanza. Tutte le galline saranno accuratamente esaminate diverse volte per i primi 2 giorni e almeno quotidianamente a partire dal terzo fino alla soppressione degli animali, prevista per il ventunesimo giorno. Si registreranno tutti i segni di tossicità, nonché il momento della comparsa, la natura, la gravità e la durata di qualsiasi anomalia del comportamento. Per l'atassia si utilizzerà un sistema di classificazione comprendente un minimo di quattro livelli, si registreranno altresì i casi di paralisi. Almeno due volte alla settimana le galline selezionate per l'osservazione dovranno essere tolte dalle gabbie o sottoposte ad attività motoria forzata (per esempio salire le scale) al fine di agevolare l'osservazione degli effetti tossici minimi. Gli animali moribondi o recanti segni gravi e persistenti di sofferenza dovranno essere immediatamente sottoposti ad eutanasia e ad esame necroscopico.

1.5.3.2 **Peso corporeo**

Tutte le galline saranno pesate poco prima della somministrazione della sostanza e almeno una volta alla settimana successivamente

1.5.3.3 **Biochimica**

Pochi giorni dopo l'esposizione si sopprimeranno sei galline scelte in modo casuale da ciascuno dei gruppi trattati e di controllo negativo e tre appartenenti al gruppo di controllo positivo (se realizzato). Il cervello e il midollo spinale lombare saranno quindi preparati e analizzati per identificare un'eventuale attività di inibizione della NTE. Inoltre può essere utile effettuare la stessa analisi su tessuti del nervo sciatico. Generalmente si sopprimono tre animali per il gruppo di controllo e per ciascuno dei gruppi trattati a distanza di 24 ore ed altri tre a distanza di 48 ore, mentre le tre galline del gruppo di controllo positivo vengono sopprese dopo 24 ore. Qualora l'osservazione dei segni clinici di intossicazione (spesso valutabili in funzione della comparsa di effetti colinergici) suggerisca che l'eliminazione della sostanza tossica avviene molto lentamente, può essere preferibile effettuare altri due prelievi tissutali da tre animali nel periodo compreso tra 24 e non oltre 72 ore dopo la somministrazione.

Se del caso, è possibile effettuare su tali tessuti analisi dell'acetilcolinesterasi (AChE). Tuttavia si può avere una riattivazione spontanea dell'AChE in vivo, il che potrebbe indurre a sottovalutare il potenziale di inibizione dell'AChE di una sostanza.

1.5.3.4 **Necropsia macroscopica**

L'esame necroscopico di tutti gli animali (sia di quelli soppressi come da programma che di quelli sottoposti ad eutanasia) dovrà comprendere l'osservazione dell'aspetto del cervello e del midollo spinale.

1.5.3.5 **Esame istopatologico**

I tessuti nervosi degli animali sopravvissuti al periodo di osservazione e non utilizzati per gli studi biochimici saranno sottoposti ad esame microscopico. Essi saranno fissati in situ con tecniche di perfusione. I prelievi tissutali saranno effettuati su cervelletto (piano longitudinale medio), midollo allungato, midollo spinale e nervi periferici. Il midollo spinale sarà prelevato dal tratto cervicale superiore, dal terzo toracico centrale e dal tratto lombo-sacrale. Si preleveranno inoltre tessuti dal segmento distale del nervo tibiale e delle sue ramificazioni verso il muscolo gastrocnemio e dal nervo sciatico. I tessuti saranno colorati con appositi coloranti specifici per la mielina e gli assoni.

2 **DATI**

Di norma, se i risultati ottenuti per i parametri di valutazione adottati nel presente metodo (biochimica, istopatologia e osservazione del comportamento) sono negativi, non è necessario eseguire ulteriori saggi di neurotossicità ritardata. Risultati equivoci o non conclusivi possono invece richiedere un approfondimento.

Dovranno essere forniti i dati individuali di ciascun animale. Inoltre, tutti i dati dovranno essere riassunti in una tabella indicante, per ogni gruppo, il numero di animali all'inizio del saggio, il numero di animali recanti lesioni, alterazioni del comportamento o effetti biochimici, la natura e la gravità di detti effetti o lesioni e la percentuale di animali per ogni tipo di effetto o lesione e per ogni livello di gravità.

I risultati del presente studio dovranno essere valutati in termini di incidenza, gravità e correlazione tra effetti comportamentali, biochimici e istopatologici e qualsiasi altro effetto osservato nei gruppi trattati e di controllo.

I risultati numerici dovranno essere elaborati sulla base di metodi statistici appropriati e generalmente riconosciuti. I metodi statistici saranno selezionati durante la fase di progettazione dello studio.

3. **RELAZIONE****Relazione sul saggio**

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

Animali da esperimento:

- ceppo utilizzato;
- numero e età degli animali;
- origine, condizioni di alloggiamento, ecc.,
- peso di ciascun animale all'inizio del saggio.

Condizioni sperimentali:

- modalità precise di preparazione della sostanza in esame, stabilità e omogeneità, ove del caso;
- motivazione della scelta del veicolo;
- modalità precise di somministrazione della sostanza in esame;
- caratteristiche della qualità del cibo e dell'acqua;
- motivazione della scelta del dosaggio;
- dosi somministrate, caratteristiche del veicolo, volume e forma fisica della sostanza somministrata;
- tipo di agente protettivo e caratteristiche di somministrazione, ove del caso

Risultati:

- dati relativi al peso corporeo;
- dati relativi alla reazione tossica per ciascun gruppo, compresa la mortalità;
- natura, gravità e durata degli effetti clinici osservati (ed eventuale reversibilità);
- descrizione particolareggiata delle analisi biochimiche e relativi risultati;
- risultati dell'esame necroscopico;
- descrizione particolareggiata di tutti i reperti istopatologici;
- elaborazione statistica dei risultati, ove del caso.

B 38 NEUROTOSSICITÀ RITARDATA DI SOSTANZE ORGANOFOSFORICHE CON SOMMINISTRAZIONE RIPETUTA PER 28 GIORNI

1 METODO

1.1 Introduzione

Per la valutazione degli effetti tossici delle sostanze è importante tener conto della facoltà di talune classi di sostanze di indurre effetti neurotossici specifici che potrebbero non essere messi in luce da altri studi di tossicità. Alcune sostanze organofosforiche, che hanno evidenziato una neurotossicità ritardata, dovrebbero essere oggetto di una valutazione in questo senso.

Saggi preliminari in vitro consentono di identificare le sostanze suscettibili di indurre una poli-neuropatia ritardata, tuttavia risultati negativi di studi in vitro non garantiscono l'assenza di neurotossicità della sostanza saggiata.

Il presente saggio di neurotossicità ritardata su 28 giorni fornisce informazioni sui rischi che l'esposizione ripetuta per un periodo limitato di tempo può comportare per la salute. Esso consente di trarre indicazioni sulla correlazione dose-risposta e di valutare il NOAEL applicabile per la determinazione di criteri di sicurezza per l'esposizione.

Vedi anche introduzione generale, parte B.

1.2 Definizioni

Le sostanze organofosforiche comprendono esteri, tioesteri o anidridi organofosforici neutri degli acidi organofosfonico, organofosfonico o organofosforamidico o dei corrispondenti acidi fosforotioico, fosfonotioico o fosforotioamidico, o altre sostanze suscettibili di indurre gli effetti neurotossici ritardati talvolta osservati in questa classe di sostanze.

La neurotossicità ritardata è una sindrome associata ad atassia prolungata a comparsa tardiva, ad assonopatie distali del midollo spinale e dei nervi periferici e ad un'inibizione e un invecchiamento dell'esterasi suggestiva di neuropatia (NTE, neuropathy target esterase) nei tessuti nervosi.

1.3 Principio del metodo di saggio

La sostanza in esame viene quotidianamente somministrata per via orale a galline domestiche per un periodo di 28 giorni. Gli animali vengono esaminati almeno una volta al giorno al fine di individuare eventuali anomalie del comportamento, atassia e paralisi fino a 14 giorni dopo l'ultima somministrazione. Analisi biochimiche, e in particolare l'inibizione della NTE, vengono di norma eseguite 24 e 48 ore dopo l'ultima esposizione su galline selezionate da ciascun gruppo secondo un criterio di casualità. Due settimane dopo l'ultima somministrazione si sopprimono gli animali superstiti e si procede all'esame istopatologico di determinati tessuti nervosi.

1.4 Descrizione del metodo di saggio

1.4.1 Preparazioni

Galline adulte, giovani e sane, che non presentino affezioni virali e non siano trattate con farmaci suscettibili di alterare i risultati del saggio, nonché esenti da turbe della deambulazione, vengono assegnate in modo casuale a gruppi da trattare e di controllo e acclimate alle condizioni di laboratorio per almeno 5 giorni prima dell'inizio del saggio.

La gabbie o i recinti saranno sufficientemente ampi affinché gli animali possano muoversi liberamente ed essere facilmente osservati durante la deambulazione.

La sostanza viene somministrata giornalmente, sette giorni su sette, preferibilmente tramite sonda gastrica o capsule di gelatina. Le sostanze liquide possono essere somministrate non diluite o disciolte in un veicolo appropriato, quale l'olio di mais. Se possibile, si avrà cura di sciogliere le sostanze solide, in quanto dosi elevate di tali sostanze in capsule di gelatina possono non essere completamente assorbite. Per i veicoli non acquosi, le caratteristiche di tossicità del veicolo dovranno essere note o, in caso contrario, determinate prima del saggio.

1.4.2 Condizioni sperimentali

1.4.2.1 Animali da esperimento

Si utilizzeranno di preferenza galline domestiche ovaiole (*Gallus gallus domesticus*), giovani e adulte, di età compresa tra 8 e 12 mesi, appartenenti a razze e a ceppi di taglia standard. Gli animali saranno allevati in condizioni che ne garantiscano la libertà di movimento.

1.4.2.2. Numero e sesso

Si utilizzano di norma almeno tre gruppi da trattare ed uno di controllo con somministrazione del solo veicolo. Quest'ultimo sarà trattato in modo identico ai primi, tranne per il fatto che agli animali non verrà somministrata la sostanza in esame.

Ogni gruppo dovrà comprendere un numero sufficiente di animali, in modo che almeno sei esemplari possano essere soppressi per effettuare le analisi biochimiche (tre a 24 e tre a 48 ore di distanza dall'ultima somministrazione) ed altri sei possano sopravvivere per i 14 giorni del periodo di osservazione.

1.4.2.3. Livelli di dosaggio

I livelli di dosaggio dovranno essere selezionati tenendo conto dei risultati del saggio di neurotossicità ritardata dopo esposizione acuta e di tutti i dati di tossicità o di tossicocinetica esistenti per la sostanza in esame. Il livello massimo di dosaggio dovrà essere tale da indurre effetti tossici, preferibilmente effetti neurotossici ritardati, senza tuttavia cagionare la morte o sofferenze gravi. Sarà inoltre definita una serie decrescente di dosaggi al fine di individuare eventuali risposte a dosi determinate e dimostrare l'assenza di effetti avversi al dosaggio minimo.

1.4.2.4. Saggio limite

Qualora un saggio, effettuato in conformità con il metodo descritto, con un livello di dosaggio di almeno 1000 mg/kg di peso corporeo/giorno, non produca effetti tossici evidenti e se i dati relativi a sostanze di struttura affine non sono suggestivi di tossicità, può non essere necessario somministrare un dosaggio superiore. Il saggio limite giustificato, salvo nel caso in cui l'esposizione umana comporti la necessità di utilizzare un più elevato livello di dosaggio.

1.4.2.5. Periodo di osservazione

Tutti gli animali saranno esaminati almeno quotidianamente durante il periodo di esposizione e nei 14 giorni successivi, salvo nel caso in cui sia previsto un esame necroscopico.

1.4.3. Procedimento

La sostanza in esame viene somministrata sette giorni su sette per un periodo di 28 giorni.

1.4.3.1. Osservazioni generali

Il periodo di osservazione inizia subito dopo l'esposizione alla sostanza. Tutte le galline saranno accuratamente esaminate almeno una volta al giorno per i 28 giorni del trattamento e i 14 giorni successivi, fino al momento della loro soppressione. Si registreranno tutti i segni di tossicità, specificandone il momento della comparsa, la natura, la gravità e la durata. Le osservazioni riguarderanno, tra l'altro, eventuali anomalie comportamentali. Per l'atassia si utilizzerà un sistema di classificazione comprendente un minimo di quattro livelli; si registreranno altresì i casi di paralisi. Almeno due volte alla settimana le galline selezionate per l'osservazione dovranno essere tolte dalle gabbie e sottoposte ad attività motoria forzata (per esempio salire le scale) al fine di agevolare l'osservazione degli effetti tossici minimi. Gli animali moribondi o recanti segni gravi e persistenti di sofferenza dovranno essere immediatamente sottoposti ad eutanasia e ad esame necroscopico.

1.4.3.2. Peso corporeo

Tutte le galline saranno pesate poco prima della somministrazione della sostanza e almeno una volta alla settimana successivamente.

1.4.3.3. Biochimica

Pochi giorni dopo l'ultima esposizione si sopprimeranno sei galline scelte in modo casuale da ciascuno dei gruppi trattati e dal gruppo di controllo con somministrazione del solo veicolo. Il cervello e il midollo spinale lombare saranno quindi preparati e analizzati per identificare un eventuale attività di inibizione della NTE. Inoltre può essere utile effettuare la stessa analisi su tessuti del nervo sciatico. Generalmente si sopprimono tre animali per il gruppo di controllo e per ciascuno dei gruppi trattati dopo 24 ore ed altri tre dopo 48 ore dall'ultima somministrazione. Qualora i risultati preferibile in base ai risultati dello studio con esposizione acuta o di altri studi (per esempio di tossicocinetica), si potranno modificare i tempi previsti per la soppressione degli animali. Tale scelta dovrà essere tuttavia scientificamente motivata.

Se del caso, è possibile effettuare su tali tessuti analisi dell'acetilcolinesterasi (AChE). Tuttavia si può avere una riattivazione spontanea dell'AChE in vivo il che potrebbe indurre a sottovalutare il potenziale di inibizione dell'AChE di una sostanza.

1.4.3.4 Necropsia macroscopica

L'esame necroscopico di tutti gli animali (sia di quelli soppressi come da programma che di quelli sottoposti ad eutanasia) dovrà comprendere l'osservazione dell'aspetto del cervello e del midollo spinale.

1.4.3.5 Esame istopatologico

I tessuti nervosi degli animali sopravvissuti al periodo di osservazione e non utilizzati per gli studi biochimici saranno sottoposti ad esame microscopico. Essi saranno fissati in situ con tecniche di perfusione. I prelievi tissutali saranno effettuati su cervelletto (piano longitudinale medio), midollo allungato, midollo spinale e nervi periferici. Il midollo spinale sarà prelevato dal tratto cervicale superiore, dal terzo toracico centrale e dal tratto lombosacrale. Si preleveranno inoltre tessuti dal segmento distale del nervo tibiale e delle sue ramificazioni verso il muscolo gastrocnemio e dal nervo sciatico. I tessuti saranno colorati con appositi coloranti specifici per la mielina e gli assoni. L'esame microscopico sarà dapprima effettuato su tessuti conservati di tutti gli animali del gruppo di controllo e di quello trattato con il livello massimo di dosaggio. Qualora in questo gruppo si riscontrino effetti, si procederà all'esame microscopico di tessuti prelevati da animali appartenenti agli altri due gruppi (rispettivamente con somministrazione del dosaggio intermedio e del dosaggio minimo).

2 DATI

Di norma, se i risultati ottenuti per i parametri di valutazione adottati nel presente metodo (biochimica, istopatologia e osservazione del comportamento) sono negativi, non è necessario eseguire ulteriori saggi di neurotossicità ritardata. Risultati equivoci o non conclusivi possono invece richiedere un approfondimento.

Dovranno essere forniti i dati individuali di ciascun animale. Inoltre, tutti i dati dovranno essere riassunti in una tabella indicante, per ogni gruppo, il numero di animali all'inizio del saggio, il numero di animali recanti lesioni, alterazioni del comportamento o effetti biochimici, la natura e la gravità di detti effetti o lesioni e la percentuale di animali per ogni tipo di effetto o lesione e per ogni livello di gravità.

I risultati del presente studio dovranno essere valutati in termini di incidenza, gravità e correlazione tra effetti comportamentali, biochimici e istopatologici e qualsiasi altro effetto osservato nei gruppi trattati e di controllo.

I risultati numerici dovranno essere elaborati sulla base di metodi statistici appropriati e generalmente sconosciuti. I metodi statistici saranno selezionati durante la fase di progettazione dello studio.

3 RELAZIONE

Relazione sul saggio

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

Animali da esperimento

- ceppo utilizzato,
- numero e età degli animali,
- origine, condizioni di alloggiamento ecc.
- peso di ciascun animale all'inizio del saggio.

Condizioni sperimentali

- modalità precise di preparazione della sostanza in esame: stabilità e omogeneità, ove del caso;
- motivazione della scelta del veicolo;
- modalità precise di somministrazione della sostanza in esame:
 - caratteristiche della qualità del cibo e dell'acqua;
- motivazione della scelta del dosaggio;
- dosi somministrate: caratteristiche del veicolo, volume e forma fisica della sostanza somministrata;
- qualora le analisi biochimiche vengano effettuate in tempi diversi da quelli previsti (24 e 48 h): motivazione di tale scelta.

Risultati:

- dati relativi al peso corporeo,
- dati relativi alla reazione tossica per ciascun livello di dosaggio, compresa la mortalità,
- livello di esposizione massimo per il quale non siano stati osservati effetti avversi (NOAEL),
- natura, gravità e durata degli effetti clinici osservati (ed eventuale reversibilità),
- descrizione particolareggiata delle analisi biochimiche e relativi risultati,
- risultati dell'esame necroscopico,
- descrizione particolareggiata di tutti i reperti istopatologici,
- elaborazione statistica dei risultati, ove del caso

*Discussione dei risultati:**Conclusioni:***4. RIFERIMENTI**

Il presente metodo corrisponde al metodo OCSE TG 419.

PARTE C: METODI PER LA DETERMINAZIONE DELLA ECOTOSSICITÀ

INTRODUZIONE GENERALE: PARTE C

I metodi di prova di seguito descritti servono alla determinazione di alcune proprietà ecotossicologiche enumerate nell'allegato VII e nell'allegato VIII. Il notificatore deve tener presente che i metodi per la determinazione delle seguenti proprietà previste al livello I dell'allegato VIII non sono inclusi nel testo:

- studio di tossicità prolungata sulla *Daphnia magna*,
- prova su una pianta superiore,
- studio di tossicità prolungata su un pesce,
- prova di accumulazione in una specie.

Quando opportuni metodi di prova per la determinazione di queste proprietà saranno ultimati, saranno pubblicati sotto forma di un ulteriore adeguamento al progresso tecnico. Nel frattempo il notificatore deve applicare metodi opportuni, internazionalmente riconosciuti, che devono essere specificati all'autorità competente.

C.1. TOSSICITÀ ACUTA PER I PESCI

1 METODO

1.1 INTRODUZIONE

Lo scopo di questo saggio è di determinare la tossicità letale acuta di una sostanza nei confronti di pesci in acqua dolce

Per poter scegliere il metodo di saggio (statico, semistatico o a flusso continuo) più idoneo a garantire che le concentrazioni della sostanza in esame si mantengano soddisfacentemente costanti per tutta la durata del saggio, è desiderabile disporre, per quanto possibile, di dati concernenti la solubilità in acqua, la tensione di vapore, la stabilità chimica, le costanti di dissociazione e la biodegradabilità della sostanza in esame

Sia per la programmazione della prova che per l'interpretazione dei risultati si dovrebbero tenere in considerazione anche altre informazioni (per esempio formula di struttura, grado di purezza, natura e percentuale delle impurezze significative, presenza e quantità di additivi e coefficiente di ripartizione n-ottanolo/acqua)

1.2 DEFINIZIONE E UNITÀ

La tossicità acuta è l'effetto avverso osservabile indotto in un organismo entro un breve tempo (giorni) di esposizione ad una data sostanza. Nel presente saggio, la tossicità acuta viene espressa come concentrazione letale media (CL_{50}), che è la concentrazione di una sostanza nell'acqua capace di uccidere il 50 % di un gruppo di pesci entro un periodo continuo di esposizione, la cui durata deve essere precisata

Tutte le concentrazioni delle sostanze in esame sono espresse in peso/volume (mg/l). Esse possono anche venire espresse in peso/peso ($mg\ kg^{-1}$)

1.3 SOSTANZE DI RIFERIMENTO

Per dimostrare che, nelle condizioni sperimentali di laboratorio, la risposta della specie usata per il saggio non è variata in modo significativo, può essere saggiata una sostanza di riferimento

Per il presente saggio non vengono specificate sostanze di riferimento

1.4 PRINCIPIO DEL METODO DI SAGGIO

Si può eseguire un saggio limite a 100 mg per litro allo scopo di dimostrare che la CL_{50} è maggiore di questa concentrazione

I pesci sono esposti alla sostanza (alle sostanze) in esame, aggiunta all'acqua in varie concentrazioni, per un periodo di 96 ore. Le mortalità vengono registrate almeno ad intervalli di 24 ore, quando possibile, per ciascun tempo di osservazione si calcola la concentrazione (CL_{50}) alla quale muore il 50 % dei pesci

1.5 CRITERI DI QUALITÀ

I criteri di qualità dovranno essere applicati sia per il saggio limite che per il metodo di saggio completo

La mortalità negli animali di controllo usati non deve essere superiore al 10 % (o 1 pesce se se ne usano meno di 10) al termine della prova

La concentrazione dell'ossigeno deve rimanere per tutta la prova al di sopra del 60 % del valore di saturazione dell'aria

La concentrazione della sostanza in esame deve essere mantenuta entro l'80 % della concentrazione iniziale per tutta la durata della prova

Per sostanze che si sciolgono facilmente nel mezzo di saggio producendo soluzioni stabili, cioè quelle che non presentano un grado significativo di volatilizzazione, degradazione, idrolisi o adsorbimento, la concentrazione iniziale può essere presa equivalente alla concentrazione nominale. Deve essere fornita la documentazione che la concentrazione si è mantenuta costante per tutta la durata del saggio e che sono stati soddisfatti i criteri di qualità

Per sostanze che sono

- (i) scarsamente solubili nel mezzo di saggio,
o
- (ii) in grado di formare emulsioni o dispersioni stabili,
o
- (iii) non stabili in soluzione acquosa,

come concentrazione iniziale si dovrà prendere la concentrazione misurata in soluzione (o, se non è possibile tecnicamente, misurata nella colonna d'acqua) all'inizio della prova. La concentrazione sarà determinata dopo un periodo di equilibratura, ma prima dell'introduzione dei pesci di prova

In ciascuno di questi casi, ulteriori misure devono essere effettuate durante il saggio per confermare che la concentrazione di esposizione effettiva o i criteri di qualità sono stati rispettati

Il pH non dovrebbe variare più di una unità

1.6 DESCRIZIONE DEL METODO DI SAGGIO

Tre diversi procedimenti possono essere usati

Prova statica

Prova di tossicità su pesci nel corso della quale non ha luogo alcun flusso della soluzione di saggio (le soluzioni non vengono cambiate per tutta la durata della prova)

Prova semistatica

Prova senza alcun flusso della soluzione ma nella quale le soluzioni di saggio vengono rinnovate ad intervalli regolari e prolungati (ad esempio 24 ore)

Prova a flusso continuo

Prova di tossicità nella quale l'acqua è rinnovata costantemente nelle vasche di saggio e la sostanza in esame viene trasportata insieme all'acqua usata per rinnovare l'ambiente del saggio

1.6.1 Reattivi

1.6.1.1 Soluzioni delle sostanze da esaminare

Si preparano soluzioni di riserva alla concentrazione richiesta, sciogliendo la sostanza in acqua deionizzata o comunque rispondente alle caratteristiche descritte al punto 1.6.1.2

Le concentrazioni di prova scelte vengono preparate per diluizione della soluzione di riserva. Se si saggiare concentrazioni elevate, la sostanza può essere disciolta direttamente nell'acqua di diluizione

Le sostanze devono normalmente essere saggiate solo fino al limite di solubilità. Per alcune sostanze (per esempio sostanze che hanno una scarsa solubilità in acqua o un elevato P_{ow} , o quelle che formano dispersioni stabili piuttosto che soluzioni vere in acqua), è accettabile preparare un livello di concentrazione al di sotto del limite di solubilità della sostanza per garantire di raggiungere la massima concentrazione solubile/stabile. È importante tuttavia che questa concentrazione non disturbi altrimenti il sistema di saggio (per esempio la pellicola della sostanza sulla superficie dell'acqua che impedisca l'ossigenazione dell'acqua, ecc.)

Si può ricorrere a dispersione ultrasonica, solventi organici, emulsionanti o disperdenti come aiuti per preparare le soluzioni concentrate di riserva delle sostanze di scarsa solubilità in acqua o per disperdere queste sostanze nell'ambiente di prova. Quando si utilizzano tali sostanze ausiliarie, tutte le concentrazioni da saggiare dovrebbero contenere la stessa quantità di sostanza ausiliaria, e pesci di controllo addizionali dovrebbero essere

esposti alla stessa concentrazione della sostanza ausiliaria usata nella serie di concentrazioni da saggiare. La concentrazione di tali sostanze ausiliarie deve essere minimizzata, e in nessun caso deve superare i 100 mg per litro nell'ambiente di prova.

La prova dovrebbe essere effettuata senza aggiustamento del pH. Se esiste evidenza di variazioni pronunciate del pH, si consiglia di ripetere la prova procedendo all'opportuna regolazione del pH e riportando i risultati. In questo caso, il valore del pH della soluzione di riserva dovrebbe essere aggiustato a quello dell'acqua di diluizione, a meno che non esistano specifiche ragioni per agire diversamente. A tal fine sono da preferirsi HCl ed NaOH. Questa regolazione del pH dovrebbe essere effettuata in modo che la concentrazione della sostanza in esame nella soluzione di riserva non cambi in modo significativo. Qualora la regolazione dovesse provocare reazioni chimiche o la precipitazione fisica del composto in esame, ciò dovrebbe essere riportato.

1.6.1.2. *Acqua di stabulazione e di diluizione*

Si possono impiegare acqua potabile (non contaminata da concentrazioni potenzialmente pericolose di cloro, metalli pesanti od altre sostanze), acqua naturale di buona qualità od acqua ricostituita (vedi Appendice 1). Sono da preferirsi acque con una durezza totale compresa tra 10 e 250 mg/l (come CaCO_3) e con pH fra 6,0 e 8,5.

1.6.2. *Attrezzatura*

Tutte le attrezzature devono essere costruite in materiale chimicamente inerte.

- sistema di diluizione automatico (per le prove a flusso continuo),
- misuratore di ossigeno,
- apparecchiatura per la determinazione della durezza dell'acqua,
- apparecchiatura adeguata per il controllo della temperatura,
- pH-metro.

1.6.3. *Pesci per il saggio*

I pesci devono essere in buona salute e non presentare evidenti malformazioni.

Le specie usate devono essere scelte sulla base di criteri pratici, come la loro facile disponibilità per tutto l'anno, la facilità di mantenimento, la idoneità per il saggio, sensibilità relativa e qualsiasi fattore economico, biologico o ecologico avente qualche rilevanza. Nella scelta della specie di pesce si deve tenere presente anche la necessità di poter confrontare i dati ottenuti e l'armonizzazione internazionale esistente (riferimento 1).

Un elenco di specie ittiche che sono raccomandate per l'esecuzione di questo saggio è presentato in Appendice 2. Le specie preferite sono il danio zebrato e la trota.

1.6.3.1. *Stabulazione*

I pesci dovrebbero provenire di preferenza da un singolo gruppo con lunghezza ed età simili. Essi devono essere mantenuti per almeno 12 giorni nelle seguenti condizioni:

densità degli animali

appropriata al sistema (riciclo o flusso continuo) e alla specie di pesce.

acqua

vedi punto 1.6.1.2.

illuminazione

fotoperiodo da 12 a 16 ore al giorno.

concentrazione dell'ossigeno disciolto

almeno l'80 % del valore di saturazione dell'aria,

alimentazione

tre volte alla settimana o quotidianamente con sospensione 24 ore prima dell'inizio della prova

1 6 3 2 *Mortalità*

Dopo un periodo di adattamento di 48 ore, si procede a registrare la mortalità e si applicano i seguenti criteri

- mortalità superiore al 10 % della popolazione in sette giorni
l'intera partita viene respinta,
- mortalità tra il 5 e il 10 % della popolazione il periodo di adattamento prosegue per altri sette giorni: Se non si verificano ulteriori mortalità, la partita è accettabile, in caso contrario essa deve essere respinta,
- mortalità inferiore al 5 % della popolazione
la partita è accettabile

1 6 4 *Adattamento*

Prima dell'impiego, tutti i pesci debbono essere posti per almeno sette giorni in acqua della qualità e temperatura da impiegare per il saggio

1 6 5 *Procedimento del saggio*

Al saggio definitivo si può far precedere una prova orientativa allo scopo di ottenere informazioni per definire l'intervallo di concentrazioni da impiegare

In aggiunta alla serie di concentrazioni da saggiare, si esegue anche una esposizione di controllo senza la sostanza in esame e, se pertinente, una esposizione di controllo contenente la sostanza ausiliaria

A seconda delle proprietà fisiche e chimiche del composto in esame, si deve scegliere una prova statica, semistatica o a flusso continuo, secondo quanto più appropriato per soddisfare i criteri di qualità

I pesci vengono esposti alla sostanza nel modo indicato di seguito

- durata 96 ore,
- numero di animali almeno 7 per concentrazione,
- vasche di capacità opportuna secondo il carico raccomandato,
- densità dei pesci per i saggi statici e semistatici si raccomanda un carico di biomassa massimo di 1,0 g/l, per i sistemi a flusso continuo può essere accettabile un carico più elevato,
- concentrazioni di saggio almeno cinque concentrazioni, differenti per un fattore costante non superiore a 2,2, e che, nel limite del possibile, coprano l'intervallo di mortalità dallo 0 al 100 %,
- acqua vedi punto 1 6 1 2,
- illuminazione fotoperiodo quotidiano da 12 a 16 ore al giorno,
- temperatura appropriata alla specie (vedi appendice 2) ma con variazioni entro $\pm 1^\circ\text{C}$ per ciascuna prova,
- concentrazione dell'ossigeno disciolto non meno del 60 % del valore di saturazione dell'aria alla temperatura prescelta,
- alimentazione nessuna

I pesci sono esaminati dopo le prime 2-4 ore ed almeno a intervalli di 24 ore. Essi sono considerati morti se toccando il peduncolo caudale non si ha alcuna reazione e non sono visibili movimenti respiratori. I pesci morti sono allontanati al momento in cui vengono osservati e le mortalità devono essere registrate

Va presa nota delle anomalie visibili (come la perdita di equilibrio, cambiamento di comportamento alla natazione, funzione respiratoria, pigmentazione, ecc.).

Il pH, l'ossigeno disciolto e la temperatura devono essere misurati quotidianamente.

Saggio limite

Usando le procedure descritte in questo metodo di saggio, si può eseguire un saggio limite a 100 mg per litro allo scopo di dimostrare che la CL_{50} è più elevata di questa concentrazione.

Se la natura della sostanza è tale che non si possa raggiungere una concentrazione di 100 mg per litro nel mezzo di saggio, il saggio limite deve essere eseguito ad una concentrazione uguale alla solubilità della sostanza (o alla concentrazione massima formante una dispersione stabile) nell'ambiente usato (vedi anche 1.6.1.1.).

Il saggio limite deve essere eseguito usando da 7 a 10 pesci, con lo stesso numero nel saggio (nei saggi) di controllo. (La teoria binomiale stabilisce che quando si utilizzano 10 pesci con mortalità 0, c'è il 99,9 % di confidenza che la CL_{50} sia maggiore della concentrazione usata nel saggio limite. Con 7, 8 o 9 pesci l'assenza di mortalità assicura una confidenza di almeno il 99 % che la CL_{50} sia maggiore della concentrazione usata.)

Se si verifica mortalità, occorre eseguire uno studio completo. Se si osservano effetti sub-letali, questi devono essere registrati.

2. DATI E VALUTAZIONE

Per ciascun periodo in cui sono registrate osservazioni (24, 48, 72 e 96 ore) riportare su carta logaritmico-probabilistica la mortalità percentuale per ciascun periodo di esposizione raccomandato in funzione della concentrazione.

Dove è possibile, e per ciascun tempo di osservazione, si dovrebbero stimare la CL_{50} e i limiti di confidenza statistica ($p = 0,05$) con l'uso di procedure standard; questi valori devono essere arrotondati ad una (o al massimo due) cifre significative (esempi di arrotondamento a due cifre: 170 per 173,5; 0,13 per 0,127; 1,2 per 1,21).

Nei casi in cui il coefficiente angolare della curva di concentrazione/risposta percentuale è troppo alto per permettere il calcolo della CL_{50} , è sufficiente una stima grafica di questo valore.

Quando due concentrazioni consecutive in un rapporto di 2,2 danno solo 0 e 100 % di mortalità, questi due valori sono sufficienti per indicare l'intervallo in cui cade la CL_{50} .

Qualora si osservasse che la stabilità o l'omogeneità della sostanza in esame non può essere mantenuta, tale fatto dovrebbe essere indicato nella relazione e l'interpretazione dei risultati dovrebbe essere fatta con prudenza.

3. RELAZIONE

La relazione sulla prova deve, se possibile, includere le seguenti informazioni:

- informazioni sul pesce impiegato per la prova (nome scientifico, ceppo, fornitore, eventuali pretrattamenti, grandezza e numero impiegato a ciascuna concentrazione di saggio);
- fonte dell'acqua di diluizione e principali caratteristiche chimiche (pH, durezza, temperatura);
- nel caso di una sostanza di scarsa solubilità in acqua, il metodo di preparazione della soluzione concentrata di riserva e della soluzione di saggio;
- concentrazione di eventuali sostanze ausiliarie;

- elenco delle concentrazioni usate e qualsiasi informazione disponibile relativa alla stabilità, alle concentrazioni della sostanza chimica provata nella soluzione di saggio;
- se si eseguono analisi chimiche, metodi usati e risultati ottenuti;
- risultati dell'eventuale saggio limite;
- ragioni della scelta e dettagli del procedimento usato nel saggio (per esempio statico, semistatico, tasso di dosaggio, portata nel caso di flusso continuo, eventuale aereazione, densità dei pesci, ecc.);
- descrizione dell'apparecchiatura sperimentale;
- regime di illuminazione;
- concentrazione dell'ossigeno disciolto, pH e temperatura delle soluzioni di saggio ogni 24 ore;
- evidenze del fatto che sono stati soddisfatti i criteri di qualità;
- una tabella che presenti la mortalità cumulativa a ciascuna concentrazione e nel controllo (e controllo con la sostanza ausiliaria, se richiesto) a ciascuno dei tempi di osservazione raccomandati;
- grafico della curva di concentrazione/risposta percentuale al termine del saggio;
- se possibile, i valori di CL_{50} a ciascuno dei tempi di osservazione raccomandati (con limiti di confidenza statistica al 95 %);
- procedure statistiche usate per determinare i valori della CL_{50} ;
- se si usa una sostanza di riferimento, risultati ottenuti;
- concentrazione di saggio massima che non ha causato mortalità nel periodo di saggio;
- concentrazione di saggio minima che ha provocato il 100 % di mortalità nel periodo del saggio.

Appendice I

Acqua ricostituita

Esempio di acqua di diluizione appropriata

Tutti i prodotti chimici devono avere purezza analitica.

Dovrebbe essere impiegata acqua distillata di buona qualità oppure acqua deionizzata, di conduttività, inferiore a $5 \mu\text{Scm}^{-1}$

L'apparecchio per la distillazione dell'acqua non deve contenere parti in rame.

Soluzioni di riserva

CaCl ₂ · 2H ₂ O (calcio cloruro diidrato):	11,76 g
Sciogliere e portare ad un litro con acqua.	
MgSO ₄ · 7H ₂ O (magnesio solfato eptaidrato):	4,93 g
Sciogliere e portare ad un litro con acqua.	
NaHCO ₃ (sodio bicarbonato):	2,59 g
Sciogliere e portare ad un litro con acqua.	
KCl (potassio cloruro):	0,23 g
Sciogliere e portare ad un litro con acqua.	

Acqua di diluizione ricostituita

Mescolare 25 ml di ciascuna delle quattro soluzioni di riserva e portare ad un litro con acqua.

Aerare finché la concentrazione dell'ossigeno disciolto uguagli il valore di saturazione per l'aria

Il pH dovrebbe essere di $7,8 \pm 0,2$.

Se necessario regolare il pH mediante aggiunte di NaOH (sodio idrossido) o HCl (acido cloridrico)

L'acqua di diluizione così preparata viene lasciata da parte per circa 12 ore e non richiede alcuna ulteriore aerazione.

La somma degli ioni Ca e Mg in questa soluzione è di 2,5 mmol/l. Il rapporto degli ioni Ca e Mg è di 4:1 e quello degli ioni Na e K è di 10:1. L'alcalinità totale di questa soluzione è 0,8 mmol/l.

Eventuali deviazioni nel modo di preparare l'acqua di diluizione non devono modificarne la composizione e le proprietà.

Appendice 2

Specie di pesci raccomandate per il saggio

Specie raccomandate	Intervallo di temperatura raccomandato per il saggio (°C)	Lunghezza totale raccomandata per gli animali da saggio (cm)
<i>Brachydanio rerio</i> (Teleostei, Cyprinidae) (Hamilton-Buchanan) Danio Zebrato	20 a 24	3,0 ± 0,5
<i>Pimephales promelas</i> (Teleostei, Cyprinidae) (Rafinesque) Fathead minnow	20 a 24	5,0 ± 2,0
<i>Cyprinus carpio</i> (Teleostei, Cyprinidae) (Linnaeus 1758) Carpe comune	20 a 24	6,0 ± 2,0
<i>Oryzias latipes</i> (Teleostei, Poeciliidae Cyprinodontidae) (Tomminck et Schlegel 1850) Red Killifish	20 a 24	3,0 ± 1,0
<i>Poecilia reticulata</i> (Teleostei, Poeciliidae) (Peters 1859) Guppy	20 a 24	3,0 ± 1,0
<i>Lepomis macrochirus</i> (Teleostei, Centrarchidae) (Rafinesque Linnaeus 1758) Bluegill	20 a 24	5,0 ± 2,0
<i>Onchorhynchus mykiss</i> (Teleostei, Salmonidae) (Walbaum 1988) Trota iridea	12 a 17	6,0 ± 2,0
<i>Leuciscus idus</i> (Teleostei, Cyprinidae) (Linnaeus 1758) Golden orfe	20 a 24	6,0 ± 2,0

Raccolta

I pesci suelencati sono allevabili facilmente e/o sono largamente disponibili per tutto l'anno. Possono riprodursi e essere mantenuti sia in stabilimenti di acquicoltura sia in laboratorio, sotto condizioni di controllo delle malattie e dei parassiti, in modo che gli animali di saggio saranno sani e geneticamente controllati. Questi pesci sono disponibili in molte parti del mondo.

Appendice 3

Esempio di curva concentrazione/percento di mortalità

Esempio di determinazione della LC_{50} usando carta log-probit

C.2. TOSSICITÀ ACUTA PER LE DAPHNIA

1 METODO

1.1 INTRODUZIONE

Lo scopo di questo saggio è di determinare la concentrazione efficace mediana di immobilizzazione (CE_{50}) di una sostanza nei confronti di *Daphnia* in acqua dolce.

Prima di iniziare il saggio è desiderabile disporre per quanto è possibile di informazioni aggiuntive concernenti la solubilità in acqua, la tensione di vapore, la stabilità chimica, le costanti di dissociazione e la biodegradabilità della sostanza in esame.

Sia per la programmazione della prova che per l'interpretazione dei risultati si dovrebbero tenere in considerazione anche altre informazioni (per esempio formula di struttura, grado di purezza, natura e percentuale delle impurezze significative, presenza e quantità di additivi e coefficiente di ripartizione n ottanolo/acqua).

1.2 DEFINIZIONE E UNITÀ

Il disposto della direttiva concernente la CL_{50} per *Daphnia* è da considerarsi soddisfatto dalla determinazione della CE_{50} come descritto nel presente metodo.

Ai fini di questa prova, la tossicità acuta viene espressa come concentrazione effettiva mediana (CE_{50}) per l'immobilizzazione. Essa è la concentrazione (come valori iniziali) che immobilizza il 50 % delle daphnie in un gruppo di prova entro un certo periodo di esposizione continua, che deve essere definito.

Immobilizzazione

Sono considerati immobili gli animali che, dopo lieve agitazione del contenitore usato per il saggio, non sono in grado di nuotare entro 15 secondi.

Tutte le concentrazioni delle sostanze in esame sono espresse in peso/volume (mg/l). Esse possono anche venire espresse in peso/peso ($mg\ kg^{-1}$).

1.3 SOSTANZE DI RIFERIMENTO

Per dimostrare che, nelle condizioni sperimentali di laboratorio, la sensibilità della risposta della specie usata per il saggio non è variata in modo significativo, può essere saggiata una sostanza di riferimento.

In appendice 2 è presentato il sommario dei risultati ottenuti in una prova d'intercalibrazione tra laboratori nell'ambito della CEE con l'uso di 4 differenti sostanze.

1.4 PRINCIPIO DEL METODO DI SAGGIO

Si può eseguire un saggio limite a 100 mg per litro allo scopo di dimostrare che la CE_{50} è più elevata di questa concentrazione.

Le daphnie sono esposte alla sostanza in esame aggiunta ad acqua in un certo intervallo di concentrazioni per 48 ore, se si utilizza un saggio più breve, nella relazione di prova deve essere fornita una giustificazione.

In condizioni sperimentali per il resto identiche e in un campo adeguato di concentrazioni della sostanza in esame, concentrazioni diverse di una data sostanza in esame esercitano di solito effetti diversi sulla attività natatoria della *Daphnia*. A concentrazioni diverse, si ottengono differenti percentuali di daphnie che alla fine della prova non sono più in grado di nuotare. Le concentrazioni che provocano un'immobilizzazione dello 0 o del 100 % vengono derivate direttamente dalle osservazioni sperimentali, mentre la CE_{50} a 48 ore viene determinata, se possibile, per calcolo.

Per il presente metodo si usa un sistema statico, quindi le soluzioni non vengono rinnovate durante il periodo di esposizione.

1.5 CRITERI DI QUALITÀ

I criteri di qualità valgono sia per il saggio limite che per il metodo di saggio completo

L'immobilizzazione negli animali di controllo non deve superare il 10 % al termine della prova

Le daphnie usate per la prova nei gruppi di controllo non devono essere state intrappolate alla superficie dell'acqua

Preferibilmente, la concentrazione dell'ossigeno disciolto nei contenitori usati nel saggio dovrebbe mantenersi al di sopra di 3 mg l^{-1} per tutta la durata del saggio. In nessuna circostanza, comunque la concentrazione dell'ossigeno disciolto deve scendere al di sotto di 2 mg l^{-1}

La concentrazione della sostanza in esame deve essere mantenuta con variabilità ammissibile con limite inferiore dell'80 % della concentrazione iniziale per tutta la durata della prova

Per le sostanze che si sciolgono facilmente nell'ambiente di saggio e che forniscono soluzioni stabili, ossia che non presentano in grado significativo volatilizzazione, degradazione, idrolisi o adsorbimento, la concentrazione iniziale può essere considerata come equivalente alla concentrazione nominale. Deve essere fornita la prova che la concentrazione si è mantenuta costante per tutta la durata del saggio e che sono stati soddisfatti i criteri di qualità

Per le sostanze che sono

- (i) scarsamente solubili nel mezzo liquido del saggio, o
- (ii) in grado di formare emulsioni o dispersioni stabili, o
- (iii) non stabili in soluzione acquosa,

come concentrazione iniziale si dovrà prendere la concentrazione misurata in soluzione (o, se non possibile tecnicamente, misurata nella colonna d'acqua) all'inizio della prova. La concentrazione sarà determinata dopo un periodo concesso per il raggiungimento dell'equilibrio, ma prima dell'introduzione degli organismi di prova.

In ciascuno di questi casi, ulteriori misure devono essere effettuate durante il saggio per confermare la concentrazione di esposizione effettiva o i criteri di qualità sono stati rispettati

Il pH deve variare di non più di una unità

1.6 DESCRIZIONE DEL METODO DI SAGGIO

1.6.1 Reattivi

1.6.1.1 Soluzioni delle sostanze da esaminare

Si preparano soluzioni di riserva opportunamente concentrate, sciogliendo la sostanza in acqua deionizzata o comunque rispondente alle caratteristiche descritte al punto 1.6.1.2

Le concentrazioni del saggio scelte vengono preparate per diluizione della soluzione di riserva (concentrata). Se si provano concentrazioni elevate, la sostanza può essere disciolta direttamente nell'acqua di diluizione

Le sostanze devono normalmente essere sottoposte ad esame solo fino al limite di solubilità. Per alcune sostanze (per esempio sostanze che hanno una scarsa solubilità in acqua o un elevato P_{ow} , o quelle che formano dispersioni stabili piuttosto che soluzioni vere in acqua), è accettabile eseguire una prova a concentrazione superiore al limite di solubilità della sostanza per garantire di raggiungere la massima concentrazione solubile/stabile. È importante tuttavia che questa concentrazione non disturbi altrimenti il sistema di saggio (per esempio una pellicola della sostanza sulla superficie dell'acqua che impedisca l'ossigenazione dell'acqua, ecc.)

Si può ricorrere alla dispersione ultrasonica, solventi organici, emulsionanti o disperdenti come aiuto per preparare le soluzioni concentrate di riserva delle sostanze di scarsa solubilità in acqua o per disperdere queste sostanze nel mezzo liquido del saggio. Quando si utilizzano tali sostanze ausiliari, tutte le concentrazioni di saggio devono contenere la stessa quantità di sostanza ausiliare, e devono essere esposte alla stessa concentrazione della sostanza ausiliare usata nella serie di prove del saggio *Daphnia* di un gruppo di controllo addizionale. La concentrazione di tali ausiliari deve essere minimizzata, e in nessun caso deve superare i 100 mg per litro nel mezzo liquido del saggio

Il saggio deve essere effettuato senza regolazione del pH. Se quest'ultimo manifestasse notevoli variazioni, si consiglia di ripetere il saggio procedendo all'opportuna regolazione del pH e riportando i risultati. In questo caso, il pH della soluzione di riserva deve essere portato al valore del pH dell'acqua di diluizione, a meno che non esistano specifiche ragioni per agire diversamente. A tal fine sono da preferirsi HCl ed NaOH. Questa regolazione del pH deve essere effettuata in modo che la concentrazione della sostanza in esame nella soluzione di riserva non cambi in modo significativo. Qualora la regolazione dovesse provocare reazioni chimiche o la precipitazione fisica del composto in esame, ciò andrebbe riferito.

1.6.1.2. *Acqua usata per le prove*

In questa prova si utilizza acqua ricostituita (vedi appendice 1 e riferimento (2): ISO 6341). Per evitare la necessità di acclimatazione prima della prova, si raccomanda che l'acqua usata per l'allevamento sia di qualità simile (pH, durezza) all'acqua usata per il saggio.

1.6.2. *Apparecchiatura*

Devono essere utilizzate normali apparecchiature e strumentazioni di laboratorio. Gli apparecchi destinati a venire a contatto con le soluzioni del saggio dovrebbero essere preferibilmente completamente in vetro.

- misuratore di ossigeno (con microelettrodo od altro apparecchio adatto per la misurazione dell'ossigeno in campioni di piccolo volume);
- adeguata apparecchiatura per il controllo della temperatura;
- pH-metro;
- apparecchiatura per la determinazione della durezza dell'acqua.

1.6.3. *Organismi per il saggio*

Daphnia magna è la specie sperimentale preferita, è però ammessa anche la *Daphnia pulex*. Gli animali sperimentali dovranno avere un'età minore di 24 ore all'inizio della prova, essere allevati in laboratorio, esenti da malattie palesi e la loro storia deve essere nota (per esempio allevamento — eventuali pre-trattamenti, ecc.).

1.6.4. *Procedura del saggio*

Al saggio definitivo si può far precedere una prova orientativa allo scopo di ottenere informazioni per definire l'intervallo di concentrazioni da impiegare.

In aggiunta alla serie di prove del saggio, si devono eseguire una prova di controllo senza la sostanza in esame e, se pertinente, anche una prova di controllo contenente la sostanza ausiliaria.

Le daphnie sono esposte alla sostanza come descritto nel seguito:

- *durata*: preferibilmente 48 ore;
- *numero di animali*: almeno 20 animali per ciascuna concentrazione di saggio, di preferenza divisi in 4 gruppi di 5 individui ciascuno o in 2 gruppi di 10;
- *carico*: per le daphnie deve esserci una disponibilità della soluzione in esame in ragione di almeno 2 ml per ciascun animale;
- *concentrazione di saggio*: la soluzione da esaminare dovrebbe essere preparata immediatamente prima dell'introduzione delle daphnie, preferibilmente senza impiegare solventi diversi dall'acqua. Le concentrazioni si preparano in una serie che segue una progressione geometrica con un rapporto tra due concentrazioni immediatamente consecutive non superiore a 2,2. Si dovrebbero sperimentare, insieme alle prove di controllo, concentrazioni sufficienti a dare lo 0 e il 100 % di immobilizzazione dopo 48 ore e un campo di percentuali di immobilizzazione intermedie, che permetta il calcolo della CE₅₀ a 48 ore.
- *acqua*: vedi punto 1.6.1.2.;
- *illuminazione*: è facoltativo un ciclo luce-oscurità;
- *temperatura*: la temperatura del saggio dev'essere compresa tra 18 e 22 °C, ma una volta scelta deve mantenersi costante con variazione ammissibile di ± 1 °C;

- *aerazione*: le soluzioni del saggio non devono essere aerate con gorgogliamento d'aria;
- *alimentazione*: nessuna.

Alla fine della prova devono essere misurati il pH e la concentrazione di ossigeno dei controlli e di tutte le concentrazioni della sostanza in esame: il pH delle soluzioni della sostanza in esame non deve essere modificato.

I composti volatili devono essere saggiati in contenitori chiusi e riempiti per intero, abbastanza grandi da evitare che l'ossigeno venga a mancare.

Le daphnie vengono esaminate dopo almeno 24 ore di esposizione, e di nuovo dopo 48 ore.

Saggio limite

Usando le procedure descritte in questo metodo di saggio, si può eseguire un saggio limite a 100 mg per litro allo scopo di dimostrare che la CE_{50} si colloca al di sopra di questa concentrazione.

Se la natura della sostanza è tale che non si possa raggiungere una concentrazione di 100 mg per litro nell'acqua di esecuzione della prova, il saggio limite deve essere eseguito ad una concentrazione uguale alla solubilità della sostanza (o alla concentrazione massima formante una dispersione stabile) nel mezzo liquido usato (vedi anche 1.6.1.1.).

Il saggio limite deve essere eseguito usando 20 daphnie divise in 2 o 4 gruppi, con un ugual numero nel gruppo (nei gruppi) di controllo. Se si verifica immobilizzazione, si deve eseguire uno studio completo.

2. DATI E VALUTAZIONE

Per ciascun periodo in cui si sono registrate le osservazioni (24 e 48 ore) riportare su carta probit-semilogaritmica la mortalità percentuale in funzione della concentrazione.

Dove è possibile, e per ciascun tempo di osservazione, si dovrebbero stimare la CE_{50} e i limiti di confidenza ($p = 0,05$) con l'uso di procedimenti standard; questi valori devono essere arrotondati ad una (o al massimo due) cifre significative (esempi di arrotondamento a due cifre: 170 per 173,5; 0,13 per 0,127; 1,2 per 1,21).

Nei casi in cui la pendenza della curva di concentrazione/risposta in percentuali di immobilizzazione è troppo ripida per permettere il calcolo della CL_{50} , è sufficiente una stima grafica di questo valore.

Nel caso in cui due concentrazioni immediatamente consecutive in un rapporto di 2,2 diano solo 0 e 100 % di immobilizzazione, questi due valori sarebbero sufficienti come indicazione dell'intervallo in cui cade la CE_{50} .

Qualora si osservasse che la stabilità o l'omogeneità della sostanza in esame non possa essere mantenuta, il fatto va riferito nella relazione e si raccomanda cautela nell'interpretazione dei risultati.

3. RELAZIONE

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

- informazioni sull'organismo impiegato per il saggio (nome scientifico, ceppo, fornitore o origine, eventuali pre-trattamenti, metodo di allevamento — inclusa la fonte, il tipo e la quantità di alimento e la frequenza di alimentazione);
- origine dell'acqua di diluizione e principali caratteristiche chimiche (pH, durezza, temperatura);
- nel caso di una sostanza di scarsa solubilità in acqua, il metodo di preparazione della soluzione concentrata di riserva e della soluzione di saggio;
- concentrazione di eventuali sostanze ausiliari;
- elenco delle concentrazioni usate e qualsiasi informazione disponibile relativa alla stabilità alle concentrazioni della sostanza chimica provata nella soluzione di saggio;

- se si eseguono analisi chimiche, metodi usati e risultati ottenuti;
- risultati dell'eventuale saggio limite;
- descrizione dell'apparecchiatura sperimentale;
- regime di illuminazione;
- concentrazione dell'ossigeno disciolto, pH e temperatura delle soluzioni di saggio;
- prova che sono stati soddisfatti i criteri di qualità;
- una tabella riportante l'immobilizzazione cumulativa ottenuta a ciascuna concentrazione e al gruppo controllo (e al gruppo controllo con la sostanza ausiliare quando questo sia necessario) in corrispondenza di ciascuno dei tempi di osservazione raccomandati (24 e 48 ore);
- grafico della curva di concentrazione/risposta in percentuale di immobilizzazione al termine del saggio;
- se possibile, i valori di CE_{50} a ciascuno dei tempi di osservazione raccomandati (con limiti di confidenza al 95 %);
- procedimenti statistici usati per determinare i valori della CE_{50} ;
- se si usa una sostanza di riferimento, risultati ottenuti;
- la maggiore concentrazione sperimentata che non ha causato immobilizzazione nel periodo di saggio;
- la minore concentrazione sperimentata che ha provocato il 100 % di immobilizzazione nel periodo del saggio.

Appendice 1

Acqua ricostituita

Esempio di una acqua di diluizione adatta (secondo la norma ISO 6341)

Tutti i prodotti chimici devono avere purezza analitica.

Deve essere impiegata acqua distillata di buona qualità oppure acqua deionizzata, di conduttività inferiore a $5 \mu S cm^{-1}$.

L'apparecchio per la distillazione dell'acqua non deve contenere parti in rame.

Soluzioni di riserva

CaCl ₂ · 2 H ₂ O (cloruro di calcio idrato)	11,76 g
Sciogliere e portare ad un litro con acqua	
MgSO ₄ · 7 H ₂ O (solfato di magnesio eptaidrato)	4,93 g
Sciogliere e portare ad un litro con acqua	
NaHCO ₃ (bicarbonato di sodio)	2,59 g
Sciogliere e portare ad un litro con acqua	
KCl (cloruro di potassio)	0,23 g
Sciogliere e portare ad un litro con acqua	

Acqua di diluizione ricostituita

Mescolare 25 ml di ciascuna delle quattro soluzioni di riserva e portare ad un litro con acqua

Aerare finchè la concentrazione dell'ossigeno disciolto uguagli il valore di saturazione per l'aria

Il pH deve essere di $7,8 \pm 0,2$

Se necessario regolare il pH mediante aggiunte di NaOH (idrossido di sodio) o HCl (acido cloridrico)

L'acqua di diluizione così preparata viene lasciata da parte per circa 12 ore e non richiede alcuna ulteriore aerazione

La somma degli ioni Ca e Mg in questa soluzione è di 2,5 mmol/l. Il rapporto ioni Ca/Mg è di 4/1 e quello degli ioni Na/K è di 10/1. L'alcalinità totale di questa soluzione è 0,8 mmol/l.

Eventuali deviazioni nel modo di preparare l'acqua di diluizione non devono modificarne la composizione e le proprietà

Appendice 2

Sommario dei risultati di una prova d'intercalibrazione tra laboratori nell'ambito della CEE eseguita nel 1978 (citata anche nel riferimento 2)

Nota: lo scopo di questa prova era di determinare la CE₅₀ a 24 ore

Sostanze usate

- 1) dicromato di potassio
- 2) acido tetrapropilbenzensolfonico
- 3) acido tetrapropilbenzensolfonico, sale di sodio
- 4) acido tricloro 2,4,5 fenossiacetico, sale di potassio

Sostanze	Numero di laboratori partecipanti	Numero di risultati considerati per il calcolo	CE ₅₀ 24 ore mg/l media
1	46	129	1,5
2	36	108	27
3	31	84	27
4	32	72	770

Appendice 3

Esempio di rappresentazione grafica: concentrazione corrispondente percentuale di immobilizzazione

Esempio di determinazione della CE_{50} con l'utilizzo di carta probit-semilogaritmica

C.3. SAGGIO DI INIBIZIONE DELLA CRESCITA DELLE ALGHE

1. METODO

1.1. INTRODUZIONE

Lo scopo di questo saggio è di determinare gli effetti di una sostanza sulla crescita di una specie di alga verde unicellulare. Con saggi relativamente brevi (72 ore) si possono valutare gli effetti su varie generazioni. Questo metodo può essere adattato all'uso di parecchie specie di alghe unicellulari, nel qual caso nella relazione sul saggio deve essere fornita una descrizione del metodo usato.

Questo metodo viene applicato con particolare facilità a sostanze solubili in acqua che, nelle condizioni del saggio, hanno buone probabilità di rimanere nell'acqua.

Il metodo può essere usato per sostanze che non interferiscano direttamente con la misura della crescita delle alghe.

Prima di iniziare il saggio è desiderabile disporre, per quanto è possibile, di informazioni concernenti la solubilità in acqua, la tensione di vapore, la stabilità chimica, le costanti di dissociazione e la biodegradabilità della sostanza in esame.

Sia per la programmazione della prova che per l'interpretazione dei risultati si dovrebbero tenere in considerazione anche altre informazioni (per esempio formula di struttura, grado di purezza, natura e percentuale delle impurezze significative, presenza e quantità di additivi e coefficiente di ripartizione n-ottanolo/acqua).

1.2. DEFINIZIONI E UNITÀ

Densità delle cellule: numero di cellule per millilitro;

Crescita: aumento della densità delle cellule lungo il periodo sperimentale;

Tasso di crescita: aumento di densità delle cellule per unità di tempo;

CE₅₀: in questo metodo, la concentrazione della sostanza in esame che provoca una riduzione del 50 % della crescita (C₀E₅₀) o del tasso di crescita (C_rE₅₀) rispetto al controllo;

NOEC (concentrazione senza effetti osservabili): in questo metodo, la maggiore concentrazione sperimentata alla quale non si osserva alcuna inibizione significativa della crescita rispetto al controllo.

Tutte le concentrazioni delle sostanze in esame sono espresse in peso/volume (mg/l). Esse possono anche venire espresse in peso/peso (mg.kg⁻¹).

1.3. SOSTANZE DI RIFERIMENTO

Per dimostrare che, nelle condizioni sperimentali di laboratorio, la sensibilità della risposta della specie usata per il saggio non è variata in modo significativo, può essere saggiata una sostanza di riferimento.

Se si usa una sostanza di riferimento, i risultati ottenuti devono essere presentati nella relazione sul saggio. Come sostanza di riferimento si può usare dicromato di potassio, ma il suo colore può interferire con la qualità della luce e la sua intensità disponibile per le cellule e inoltre con le determinazioni spettrofotometriche, nel caso vengano usate. Il dicromato di potassio è stato usato in un saggio interlaboratorio internazionale (vedi riferimento (3) e appendice 2).

1.4 PRINCIPIO DEL METODO DI SAGGIO

Si può eseguire un saggio limite a 100 mg per litro della sostanza in esame allo scopo di dimostrare che la CE_{50} si pone al di sopra di questa concentrazione.

Culture in crescita esponenziale di alghe verdi selezionate sono esposte a varie concentrazioni della sostanza in esame su varie generazioni in condizioni definite.

Le soluzioni di prova sono incubate per un periodo di 72 ore, durante cui la densità delle cellule in ciascuna viene misurata almeno ogni 24 ore. Si determina l'inibizione della crescita rispetto ad una coltura di controllo.

1.5 CRITERI DI QUALITÀ

I criteri di qualità valgono sia per il saggio limite che per il metodo di saggio completo.

La densità delle cellule nelle colture di controllo deve aumentare di un fattore di almeno 16 entro 3 giorni.

La concentrazione della sostanza in esame deve essere mantenuta in modo da non scendere al di sotto dell'80 % della concentrazione iniziale per tutta la durata della prova.

Per le sostanze che si sciolgono facilmente nel mezzo liquido del saggio e che forniscono soluzioni stabili, ossia che non presentano in grado significativo volatilizzazione, degradazione, idrolisi o adsorbimento, la concentrazione iniziale può essere considerata come equivalente alla concentrazione nominale. Deve essere fornita la prova che la concentrazione si è mantenuta costante per tutta la durata del saggio e che sono stati soddisfatti i criteri di qualità.

Per le sostanze che sono:

- (i) scarsamente solubili nel mezzo liquido del saggio, o
- (ii) in grado di formare emulsioni o dispersioni stabili, o
- (iii) non stabili in soluzione acquosa,

come concentrazione iniziale si assume la concentrazione misurata all'inizio del saggio. La concentrazione deve essere determinata dopo un periodo concesso per il raggiungimento dell'equilibrio.

In ciascuno di questi casi, ulteriori misure devono essere effettuate durante il saggio per confermare la concentrazione di esposizione effettiva o i criteri di qualità sono stati rispettati.

È certo che quantità significative della sostanza in esame saranno incorporate nella biomassa delle alghe nel periodo di esecuzione del saggio. Pertanto, allo scopo di dimostrare la conformità coi criteri di qualità visti sopra, si deve prendere in considerazione sia la sostanza incorporata nella biomassa algale che la sostanza in soluzione (o, se ciò non è tecnicamente possibile, misurata nella colonna d'acqua). Tuttavia, poichè la determinazione della concentrazione di sostanza nella biomassa delle alghe può presentare dei problemi tecnici significativi, il rispetto dei criteri di qualità può essere dimostrato eseguendo una prova in un recipiente alla concentrazione massima della sostanza ma senza alghe e misurando la concentrazione in soluzione (o, se ciò non è tecnicamente possibile nella colonna d'acqua) all'inizio e al termine del periodo di prova.

1.6 DESCRIZIONE DEL PROCEDIMENTO SPERIMENTALE**1.6.1 Reagenti****1.6.1.1 Soluzioni di sostanze in esame**

Soluzioni di riserva opportunamente concentrate vengono preparate sciogliendo la sostanza in acqua deionizzata o in acqua secondo il punto 1.6.1.2.

Si preparano le concentrazioni scelte per il saggio. Aggiungendone adatte aliquote a preculture di alghe (vedi appendice 1).

Normalmente le sostanze devono essere sottoposte al saggio solo fino al limite di solubilità. Per alcune sostanze (per esempio sostanze che hanno una scarsa solubilità in acqua o un elevato $P_{0.01}$, o quelle che formano dispersioni stabili piuttosto che soluzioni vere in acqua), è accettabile includere nel saggio una concentrazione che superi il limite di solubilità della sostanza al fine di garantire di raggiungere la massima concentrazione solubile/stabile. È importante tuttavia che questa concentrazione non disturbi altrimenti il sistema di saggio (per esempio una pellicola della sostanza sulla superficie dell'acqua che impedisca l'ossigenazione dell'acqua, ecc.).

Si può ricorrere alla dispersione ultrasonica, solventi organici, emulsionanti o disperdenti come aiuto per preparare le soluzioni concentrate di riserva delle sostanze di scarsa solubilità in acqua o per disperdere queste sostanze nel mezzo liquido del saggio. Quando si utilizzano tali sostanze ausiliari, tutte le concentrazioni di saggio devono contenere la stessa quantità di sostanza ausiliare, e devono essere esposte colture di controllo aggiuntive alla stessa concentrazione della sostanza ausiliare usata nella serie di prove del saggio. La concentrazione di tali ausiliari deve essere minimizzata, e in nessun caso deve superare i 100 mg per litro nel mezzo liquido del saggio.

La prova deve essere effettuata senza regolazione del pH. Se quest'ultimo presentasse notevoli variazioni, si consiglia di ripetere la prova procedendo all'opportuna regolazione del pH e riportando i risultati. In questo caso, il valore del pH della soluzione di riserva deve essere portato al valore di quello dell'acqua di diluizione, a meno che non esistano specifiche ragioni per agire diversamente. A tal fine sono da preferirsi HCl ed NaOH. Questa regolazione del pH dovrebbe essere effettuata in modo che la concentrazione della sostanza in esame nella soluzione di riserva non cambi in modo significativo. Qualora la regolazione dovesse provocare reazioni chimiche o la precipitazione fisica del composto in esame, ciò andrebbe riferito.

6.1.2 Terreno di coltura del saggio

L'acqua deve essere acqua distillata di buona qualità o acqua deionizzata con una conducibilità minore di $5 \mu\text{S cm}^{-1}$. L'apparecchio per la distillazione dell'acqua non deve contenere parti in rame.

Si raccomanda il seguente terreno di coltura.

Si preparano quattro soluzioni madri secondo la tabella seguente. Le soluzioni madri sono sterilizzate per filtrazione su membrana oppure in autoclave e conservate al buio a 4°C . La soluzione madre numero 4 deve essere sterilizzata esclusivamente per filtrazione su membrana. Queste soluzioni madri vanno diluite per ottenere le concentrazioni finali di nutrienti nelle soluzioni sperimentali del saggio.

Nutriente	Concentrazione nella soluzione madre		Concentrazione finale nella soluzione da usare nel saggio	
Soluzione di riserva 1: macro-nutrienti				
NH ₄ Cl	1,5	g/l	15	mg/l
MgCl ₂ 6H ₂ O	1,2	g/l	12	mg/l
CaCl ₂ 2H ₂ O	1,8	g/l	18	mg/l
MgSO ₄ 7H ₂ O	1,5	g/l	15	mg/l
KH ₂ PO ₄	0,16	g/l	1,6	mg/l
Soluzione di riserva 2 Fe EDTA				
FeCl ₃ 6H ₂ O	80 mg/l		0,08 mg/l	
Na ₂ EDTA 2H ₂ O	100 mg/l		0,1 mg/l	
Soluzione di riserva 3: oligoelementi				
H ₃ BO ₃	185	mg/l	0,185	mg/l
MnCl ₂ 4H ₂ O	415	mg/l	0,415	mg/l
ZnCl ₂	3	mg/l	3 × 10 ⁻³	mg/l
CoCl ₂ 6H ₂ O	1,5	mg/l	1,5 × 10 ⁻³	mg/l
CuCl ₂ 2H ₂ O	0,01	mg/l	10 ⁻⁵	mg/l
Na ₂ MoO ₄ 2H ₂ O	7	mg/l	7 × 10 ⁻³	mg/l
Soluzione di riserva 4: NaHCO ₃				
NaHCO ₃	50	g/l	50	mg/l

Il pH del terreno di coltura, messo in equilibrio con l'aria, è approssimativamente 8.

1 6 2 **Apparecchiatura**

- normale attrezzatura di laboratorio,
 - beute per il saggio di volume adatto (per esempio, quando il volume della soluzione sperimentale è di 100 ml occorrono beute da 250 ml). Tutte le beute devono essere identiche in quanto a materiale e dimensioni
 - Attrezzatura per le colture: cabina o camera in cui è possibile mantenere con una precisione di $\pm 2^\circ\text{C}$ una temperatura nel campo tra 21°C e 25°C e fornire una illuminazione uniforme continua nel campo spettrale da 400 a 700 nm. Se le alghe nelle colture di controllo hanno raggiunto i tassi di crescita raccomandati, si può assumere che le condizioni di crescita, inclusa l'intensità luminosa, siano state adeguate.
- Si raccomanda di usare, al livello medio delle soluzioni sperimentali, un'intensità luminosa nel campo da 60 a $120 \mu\text{E} \cdot \text{m}^{-2} \cdot \text{s}^{-1}$ (da 35 a 70×10^{18} fotoni $\text{m}^{-2} \cdot \text{s}^{-1}$) quando si effettui la misura nel campo da 400 a 700 nm utilizzando un idoneo sensore. Per gli strumenti di misura della luce calibrati in lux, è accettabile un intervallo equivalente tra 6 000 e 10 000 lux.
- L'intensità luminosa occorrente può essere ottenuta usando da 4 a 7 lampade a fluorescenza da 30 W del tipo bianco universale (temperatura di colore approssimativamente 4 300 K), poste ad una distanza di 0,35 m dalla coltura di alghe.
- Le misure della densità delle cellule devono essere effettuate utilizzando un metodo di conta diretto delle cellule viventi, per esempio un microscopio con camere di conteggio. Tuttavia, si possono usare altri metodi (fotometria, torbidimetria) se sono sufficientemente sensibili e se si riscontra una sufficientemente buona correlazione con la densità delle cellule.

1 6 3 **Organismi per il saggio**

Si consiglia di usare specie di alghe verdi a rapida crescita adatte per la coltura e l'esecuzione del saggio. Sono preferite le seguenti specie:

- *Selenastrum capricornutum*, p. es. ATCC 22662 o CCAP 278/4,
- *Scenedesmus subspicatus*, p. es. 86 81 SAG,

Nota

ATCC = Raccolta Americana di Colture Tipo (U S A)

CCAP = Centro per la Coltura di Alghe e Protozoi (G B)

SAG = Raccolta di Colture Algali (Göttingen, R F G)

Se si usano altre specie, la relazione deve indicarne il ceppo.

1 6 4 **Procedimento sperimentale**

Si determina l'intervallo di concentrazioni nel quale è facile che si verifichino degli effetti sulla base di risultati ottenuti da esperimenti di selezione dell'intervallo.

Le due misure di crescita (biomassa e tasso di crescita) possono dare come risultato misure molto disperate dell'inibizione della crescita, entrambe le misure devono essere usate nella prova di individuazione del campo per assicurare che la progressione geometrica delle concentrazioni permetta una stima sia della C_{50} sia della C_{75} .

Densità iniziale delle cellule

Si raccomanda di regolare la densità iniziale delle cellule nelle colture sperimentali ad approssimativamente 10^4 cellule/ml per *Selenastrum capricornutum* e *Scenedesmus subspicatus*. Quando si utilizzano altre specie, la biomassa dovrebbe essere confrontabile.

Concentrazioni della sostanza in esame

Per il saggio, si preparano almeno 5 concentrazioni in serie geometrica con un rapporto tra ogni concentrazione e quella immediatamente successiva non superiore a 2,2. La più bassa concentrazione sperimentata non dovrebbe permettere di osservare effetti sulla crescita delle alghe. La più elevata concentrazione sperimentata dovrebbe inibire la crescita di almeno il 50 % rispetto al controllo o, preferibilmente, arrestare completamente la crescita.

Repliche e controlli

Lo schema sperimentale deve comprendere tre repliche per ogni concentrazione. Sono previsti tre controlli senza sostanza in esame e, se del caso, altri tre controlli contenenti la sostanza ausiliare. Se giustificato, lo schema sperimentale può venire modificato per aumentare il numero di concentrazioni e ridurre il numero di repliche per concentrazione.

Esecuzione del saggio

Le colture del saggio contenenti le concentrazioni desiderate di sostanza in esame e la quantità desiderata di inoculo algale vengono preparate aggiungendo aliquote di soluzioni di riserva della sostanza in esame a quantità adatte di precolture algali (vedi appendice 1). Le beute di coltura vengono agitate e disposte nell'apparecchiatura di coltura. Le cellule algali vengono mantenute in sospensione mediante sbattimento, mescolamento o gorgogliamento d'aria allo scopo di facilitare lo scambio gassoso e di ridurre le variazioni di pH nelle soluzioni del saggio. Le colture devono essere mantenute ad una temperatura con variazione ammissibile di $\pm 2^\circ\text{C}$ nell'intervallo da 21 a 25 $^\circ\text{C}$.

La densità delle cellule in ciascuna beuta viene determinata almeno 24, 48 e 72 ore dopo l'inizio del saggio. Nei casi in cui si utilizza una misura della densità delle cellule diversa del metodo di conteggio diretto, si usa il terreno di coltura algale filtrato contenente la concentrazione appropriata della sostanza chimica in esame per fissare il bianco.

Il pH viene misurato all'inizio del saggio e dopo 72 ore.

Normalmente durante il saggio il pH delle colture di controllo non deve variare più di 1,5 unità.

Saggio con sostanze volatili

Fino ad oggi non esiste un metodo accettato in modo generale per saggiare sostanze volatili. Quando è noto che una sostanza ha la tendenza a evaporare, si può far uso nel saggio di beute chiuse con la parte vuota superiore aumentata. Nel calcolare lo spazio vuoto superiore delle beute chiuse occorre tenere in considerazione la possibilità di una scarsità di CO_2 . Sono state proposte delle modifiche a questo metodo [Vedi riferimento (4)].

Si dovrebbe tentare di determinare la quantità di sostanza che rimane in soluzione, e si consiglia comunque una estrema cautela nell'interpretazione dei risultati dei saggi con sostanze volatili eseguiti con l'uso di sistemi chiusi.

Saggio limite

Utilizzando i procedimenti descritti nel presente metodo, si può eseguire un saggio limite a 100 mg per litro allo scopo di dimostrare che la CE_{50} si trova al di sopra di questa concentrazione.

Se a causa della natura della sostanza non fosse possibile raggiungere una concentrazione di 100 mg per litro nell'acqua usata per il saggio, il saggio limite dovrebbe essere eseguito ad una concentrazione corrispondente alla solubilità della sostanza (o alla concentrazione massima in cui si forma una dispersione stabile) nel terreno di coltura usato (vedi anche punto 1.6.1.1).

Il saggio limite deve essere eseguito almeno in tre repliche, anche per il controllo. Nel saggio limite devono essere usate ambedue le misure della crescita (biomassa e velocità di crescita).

Qualora in un saggio limite si riscontrasse una diminuzione media del 25 % o più nella biomassa o nel tasso di crescita rispetto al controllo, si dovrebbe eseguire un saggio completo.

2

DATI E VALUTAZIONE

La densità delle cellule misurata nelle colture sperimentali e nelle colture di controllo viene tabulata insieme con la concentrazione della sostanza in esame e dei tempi di effettuazione delle misure. Per ciascuna concentrazione della sostanza in esame e i controlli il valore medio della densità delle cellule va graficamente riportato in funzione del tempo (0-72 h) in modo da poter costruire delle curve di crescita.

Per determinare la relazione concentrazione/effetto, si ricorre a due metodi descritti qui di seguito. Alcune sostanze possono stimolare la crescita a basse concentrazioni. Devono essere presi in considerazione solamente i dati che indicano un'inibizione compresa tra lo 0 e il 100 %.

2.1 CONFRONTO DELLE AREE SOTTO LE CURVE DI CRESCITA

L'area compresa tra una determinata curva di crescita e la linea orizzontale $N = N_0$ può essere calcolata secondo la formula:

$$A = \frac{N_1 - N_0}{2} \times t_1 + \frac{N_1 + N_2 - 2N_0}{2} \times (t_2 - t_1) + \dots + \frac{N_{n-1} + N_n - 2N_0}{2} \times (t_n - t_{n-1})$$

in cui:

A = area,

N_0 = numero di cellule/ml al momento t_0 (inizio del saggio),

N_1 = numero di cellule/ml determinato a t_1 ,

N_n = numero di cellule/ml determinato al tempo t_n ,

t_1 = tempo di effettuazione della prima misura dopo l'inizio del saggio,

t_n = tempo di effettuazione della ennesima misura dopo l'inizio del saggio,

n = numero di misure effettuate dopo l'inizio del saggio.

L'inibizione percentuale della crescita cellulare relativa a ciascuna concentrazione della sostanza in esame (I_A) viene calcolata secondo la formula:

$$I_A = \frac{A_c - A_t}{A_c} \times 100$$

in cui:

A_c = area compresa tra la curva di crescita del controllo e la linea orizzontale $N = N_0$.

A_t = area compresa tra la curva di crescita alla concentrazione t e la linea orizzontale $N = N_0$.

I valori di I_A sono riportati su carta semi-logaritmica o su carta probit semi-logaritmica corrispondentemente alle rispettive concentrazioni. Se vengono tracciati su carta probit, i punti vengono interpolati con una linea retta tracciata a occhio oppure ricavata mediante calcolo di regressione.

La CE_{50} viene stimata dalla linea di regressione leggendo la concentrazione equivalente al 50 % di inibizione ($I_A = 50\%$). Per identificare in modo univoco questo valore in relazione a questo metodo di calcolo, si propone di usare il simbolo C_bE_{50} . È essenziale che la C_bE_{50} sia indicata con il periodo di esposizione pertinente, per esempio C_bE_{50} (0-72h).

2.2 CONFRONTO DEI TASSI DI CRESCITA

Il tasso medio specifico di crescita (μ) per colture in crescita esponenziale può essere calcolato come

$$\mu = \frac{\ln N_n - \ln N_0}{t_n - t_0}$$

dove t_0 è il tempo all'inizio del saggio.

In alternativa, il tasso medio specifico di crescita può essere derivato dal coefficiente angolare della linea di regressione in un grafico ove $\ln N$ appare in funzione del tempo.

L'inibizione percentuale del tasso specifico di crescita a ciascuna concentrazione della sostanza in esame ($I_{\mu t}$) viene calcolata secondo la formula:

$$I_{\mu t} = \frac{\mu_c - \mu_t}{\mu_c} \times 100$$

in cui:

μ_c = tasso medio specifico di crescita della coltura di controllo

μ_t = tasso medio specifico di crescita per la concentrazione del saggio t

La riduzione percentuale del tasso medio specifico di crescita a ciascuna concentrazione della sostanza in esame calcolata sulla base del confronto con il valore del controllo va graficamente riportata in corrispondenza del logaritmo della concentrazione. La CE_{50} può essere direttamente ricavata dal grafico che ne risulta. Per indicare in modo univoco la CE_{50} ottenuta mediante questo metodo si propone di usare il simbolo C_7E_{50} . Si deve indicare il tempo di effettuazione della misura, per esempio se il valore riguarda i tempi 0 e 72 ore, il simbolo diventa $C_7E_{50}(0-72\text{ h})$.

Nota: il tasso di crescita specifico è un termine logaritmico, e piccole variazioni del tasso di crescita possono portare a grandi variazioni della biomassa. I valori di C_6E e di C_7E non possono pertanto essere confrontati numericamente.

2.3. CALCOLO DELLA NOEC

La concentrazione senza effetti osservati è determinata mediante un'adatta procedura statistica per il confronto multicampione (per esempio analisi della varianza e test di Dunnett), utilizzando i valori delle repliche (prese individualmente) appartenenti alle aree che si trovano sotto le curve di crescita A (vedi punto 2.1) oppure i tassi specifici di crescita μ (vedi punto 2.2).

3. RELAZIONE

La relazione sul saggio deve, se possibile, includere le seguenti informazioni:

- sostanze in esame: dati di identificazione chimica,
- organismi sperimentali: origine, cultura di laboratorio, numero del ceppo, metodo di coltura,
- condizioni sperimentali:
 - data di inizio e fine del saggio e sua durata,
 - temperatura,
 - composizione del terreno di coltura,
 - apparecchiatura per le colture,
 - pH delle soluzioni all'inizio e alla prova del saggio (se si osservano deviazioni del pH superiori a 1,5 unità si devono fornire delle spiegazioni),
 - veicolo e metodo usato per solubilizzare la sostanza in esame e concentrazioni del veicolo nelle soluzioni del saggio,
 - intensità e qualità dell'illuminazione,
 - concentrazioni provate (misurate o nominali),
- risultati:
 - densità delle cellule per ciascuna beuta corrispondente ad ogni singola misurazione, e metodo usato per la misura della densità delle cellule,
 - valori medi di densità delle cellule,
 - curve di crescita,
 - rappresentazione grafica della relazione tra concentrazione ed effetto,
 - rappresentazione grafica della relazione tra concentrazione ed effetto,
 - valori di CE e metodo di calcolo,
 - NOEC,
 - altri effetti osservati.

Appendice 1

Esempio di un procedimento per coltura di alghe

Osservazioni generali

La preparazione di colture sulla base del seguente procedimento ha per scopo di ottenere colture algali per saggi di tossicità

Si devono usare metodi adatti per assicurare che le colture algali non siano infette da batteri (ISO 4833). Sono desiderabili infatti colture axeniche, e sono essenziali colture unialgali.

Tutte le operazioni devono essere eseguite in condizioni sterili allo scopo di evitare una contaminazione con batteri e altre alghe. Le colture contaminate devono essere scartate.

Procedimenti per l'ottenimento di colture algali

Preparazione di soluzioni di nutrienti (terreni di coltura)

Il terreno di coltura può essere preparato diluendo soluzioni di riserva concentrate di elementi nutritivi. Per un terreno solido, si aggiunge lo 0,8 % di agar. Il terreno usato deve essere sterile. La sterilizzazione in autoclave può portare ad una perdita di NH_3 .

Coltura di riserva

Le colture di riserva (colture madri) sono piccole colture algali che vengono trasferite con regolarità su terreno di coltura fresco per fungere da materiale di partenza per il saggio. Nel caso in cui le colture non vengano usate con regolarità, esse vanno strisciate su pezzi di agar inclinati entro provette. Questi vengono trasferiti su terreno fresco almeno una volta ogni due mesi.

Le colture di riserva vengono fatte crescere in beute contenenti il terreno appropriato (volume circa 100 ml). Quando le alghe vengono incubate a 20 °C con illuminazione continua, è necessario un trasferimento settimanale.

Durante il trasferimento, una certa quantità di coltura «vecchia» viene trasferita con pipette sterili in una beuta di terreno di coltura fresco e la quantità deve essere tale che, nel caso delle specie di crescita veloce, la concentrazione iniziale sia circa 100 volte minore di quella della coltura vecchia.

Il tasso di crescita di una specie può essere determinato dalla curva di crescita. Se questa è nota, è possibile stimare la densità alla quale la coltura deve essere trasferita ad un terreno di coltura nuovo. Ciò deve essere fatto prima che la coltura raggiunga la fase di mortalità.

Precoltura

La precoltura serve a fornire il quantitativo di alghe adatto per l'inoculo delle colture del saggio. La precoltura viene incubata nelle condizioni del saggio e usata quando è ancora in crescita esponenziale, normalmente dopo un periodo di incubazione di circa 3 giorni. Quando le colture algali contengono cellule deformate o anormali, devono essere scartate.

Appendice 2

Il protocollo «ISO 8692 — Water quality — Fresh water algal growth inhibition test with *Scenedesmus subspicatus* and *Selenastrum capricornutum*» riporta i seguenti risultati ottenuti in un saggio interlaboratorio che ha interessato 16 laboratori e nel quale è stato saggiato il dicromato di potassio.

	Media (mg/l)	Intervallo (mg/l)
I_{50} (0-72 h)	0,84	0,60-1,03
I_{50} (0-72 h)	0,53	0,20-0,75

C 4 BIODERADAZIONE Determinazione della «pronta» (ready) biodegradabilità

PARTE I CONSIDERAZIONI GENERALI

1.1 INTRODUZIONE

Vengono descritti sei metodi d'analisi che permettono di valutare la pronta biodegradabilità di composti chimici in un mezzo acquoso in condizioni aerobiche

- (a) Carbonio organico disciolto (DOC) — rimozione lenta (Metodo C 4 A)
- (b) «Screening» OCSE modificato — rimozione lenta del DOC (Metodo C 4 B)
- (c) Sviluppo di biossido di carbonio (CO₂) — Saggio di Sturm modificato (Metodo C 4-C)
- (d) Respirimetria manometrica (Metodo C 4-D)
- (e) Bottiglia chiusa (Metodo C 4-E)
- (f) MITI (Ministero del Commercio Internazionale e dell'Industria — Giappone) (Metodo C 4-F)

Nella Parte I del metodo sono date indicazioni di carattere generale nonché considerazioni comuni per tutti sei i saggi. Gli aspetti specifici dei metodi sono presentati nelle parti da II a VII. Gli allegati contengono definizioni, formule e materiale operativo

Un saggio di confronto interlaboratori OCSE, effettuato nel 1988, ha mostrato che i metodi forniscono dei risultati coerenti. Tuttavia, secondo le caratteristiche fisiche della sostanza da saggiare, si può preferire l'uno o l'altro metodo

1.2 SCELTA DEL METODO PIU' APPROPRIATO

Allo scopo di scegliere il metodo più appropriato, è essenziale disporre di informazioni sulla solubilità, sulla tensione di vapore e sulle caratteristiche di adsorbimento del composto chimico. Dovrebbe essere nota la struttura chimica o la formula bruta per calcolare i valori teorici e/o per controllare i valori dei parametri significativi, per esempio ThOD, ThCO₂, DOC, TOD, COD, misurati (si vedano gli allegati I e II)

I composti chimici da esaminare che sono solubili in acqua, ad una concentrazione di almeno 100 mg/l, possono essere valutati con tutti i metodi, a condizione che non siano volatili e non diano luogo a fenomeni di adsorbimento. In tabella n. 1 vengono riportati metodi idonei per quei composti chimici, volatili o adsorbibili, scarsamente solubili in acqua. Nell'allegato III è descritto come si possono trattare i composti chimici scarsamente solubili in acqua e quelli volatili. Composti chimici moderatamente volatili possono essere controllati mediante il metodo di rimozione lenta del DOC se nei contenitori di prova si dispone di uno spazio gassoso sufficiente (che dovrebbe opportunamente tappato). In questo caso, è necessario eseguire anche un controllo abiotico per tener conto di eventuali perdite per fenomeni fisici

Tabella 1: Applicabilità dei metodi di saggio

Saggio	Metodo analitico	Idoneità del metodo per sostanze		
		scars. solub.	volatili	adsorbibili
Rimozione lenta DOC	Carbonio organico disciolto	-		+ /
Rimozione lenta OCSE modificato	Carbonio organico disciolto	—	—	+ / -
Sviluppo CO ₂	Respirometria sviluppo CO ₂	+	-	+
Respirometria manometrica	Respirometria consumo d'ossigeno	+	+ / -	+
Bottiglia chiusa	Respirometria ossigeno disciolto	+ / -	+	+
MITI	Respirometria consumo d'ossigeno	+	+ / -	+

Per interpretare i risultati ottenuti, in particolare quando i valori di biodegradabilità sono bassi o marginali, è necessario acquisire ulteriori informazioni riguardo alla purezza e alle proporzioni relative dei componenti principali del materiale da saggiare.

Informazioni sulla tossicità del composto chimico da saggiare, nei confronti dei batteri (vedi allegato IV), possono essere molto utili per una scelta mirata della concentrazione da sottoporre a saggio e per una corretta interpretazione dei bassi valori di biodegradazione.

1.3. SOSTANZE DI RIFERIMENTO

Allo scopo di verificare la procedura, si controllano prodotti chimici di riferimento che rispettano i criteri di pronta biodegradabilità installando un pallone opportuno in parallelo come parte delle normali prove sperimentali.

Composti chimici adatti sono anilina (distillata di fresco), acetato di sodio e benzoato di sodio. Questi prodotti chimici di riferimento si degradano tutti in questi metodi anche quando non si aggiunge deliberatamente inoculo.

È stato suggerito che si dovrebbe cercare un prodotto chimico di riferimento che sia facilmente biodegradabile, ma che richieda l'aggiunta di un inoculo, anche nel saggio della bottiglia chiusa. È stato proposto l'idrogenofalato di potassio, ma mancano le prove per accettare questa sostanza come sostanza di riferimento.

Nei saggi respirometrici, i composti contenenti azoto possono influire sull'assorbimento di ossigeno a causa della nitrificazione (si vedano gli allegati II e V).

1.4. PRINCIPIO DEI METODI DI SAGGIO

Una soluzione, o sospensione, della sostanza in esame in un mezzo minerale viene inoculata e incubata in condizioni aerobiche al buio o a luce diffusa. La quantità di DOC introdotta nella soluzione con l'inoculo dovrebbe essere quanto più bassa possibile in paragone alla quantità di DOC dovuta alla sostanza in esame.

Per valutare l'attività endogena dell'inoculo, si eseguono, in parallelo, dei saggi in bianco con l'inoculo ma senza sostanze in esame, in quanto l'attività endogena delle cellule, in presenza della sostanza, non si concilia esattamente con quella del controllo. Un saggio con una sostanza di riferimento viene eseguito in parallelo per valutare l'efficacia della procedura.

In generale, la degradazione viene seguita mediante la determinazione di parametri significativi, come DOC, produzione di CO₂ e consumo dell'ossigeno. Le misure vengono effettuate ad intervalli sufficientemente frequenti per permettere l'identificazione della biodegradazione dall'inizio alla fine. Con respirometri automatici, la misurazione è continua. Il DOC viene misurato in aggiunta ad un altro parametro, di solito all'inizio e al termine della prova. Si può anche utilizzare un'analisi chimica specifica per valutare la degradazione primaria della sostanza in esame e per determinare la concentrazione delle eventuali sostanze intermedie formate (questa analisi è obbligatoria nel saggio MITI).

Normalmente la prova dura 28 giorni. Tuttavia è possibile terminare il saggio prima dei 28 giorni, per esempio appena la curva della degradazione biologica ha raggiunto un livello stazionario per almeno tre determinazioni. Le prove possono anche essere prolungate oltre i 28 giorni quando la curva mostra che la biodegradazione è iniziata ma che non si è ancora raggiunto lo stato stazionario al 28° giorno.

1.5. CRITERIO DI QUALITÀ

1.5.1. Riproducibilità

A causa della natura della biodegradazione e delle popolazioni batteriche miste usate come inoculi, le determinazioni devono essere eseguite almeno in doppio.

È esperienza comune che quanto più grande è la concentrazione di microorganismi aggiunti inizialmente al mezzo colturale, tanto minori saranno le variazioni tra le repliche. Prove di intercalibrazione tra laboratori hanno mostrato che vi possono essere grandi variazioni tra i risultati ottenuti da differenti laboratori, ma normalmente si ottiene un buon accordo con composti chimici di riferimento facilmente biodegradabili.

152

Validità del saggio

Il saggio viene considerato valido se la differenza tra i valori estremi delle prove in multiplo di rimozione del composto chimico in esame al «plateau», alla fine del saggio o alla fine della fase di crescita (time window) di 10 giorni, è minore del 20 % e se la degradazione percentuale della sostanza di riferimento ha raggiunto il livello corrispondente alla «pronta» biodegradabilità in 14 giorni. Se non si verifica una di queste condizioni, la prova deve venire ripetuta. Data la rigosità dei metodi, bassi valori non significano necessariamente che la sostanza in esame non sia biodegradabile nell'ambiente, ma che sarà necessario ulteriore lavoro per definire la biodegradabilità.

Se in un saggio di tossicità, contenente sia la sostanza in esame che un composto chimico di riferimento, in 14 giorni si verifica una degradazione inferiore al 35 % (in base al DOC) o minore del 25 % (in base a ThOD o ThCO_2), si deve supporre che i composti chimici in esame siano inibitori (si veda anche l'allegato IV). Le prove dovrebbero essere ripetute, possibilmente con l'uso di una concentrazione minore di sostanza chimica in esame e/o una concentrazione più elevata di inoculo, ma non superiore a 30 mg per litro di solido.

16

PROCEDURE GENERALI E PREPARAZIONI

Le condizioni generali che valgono per le prove sono riassunte in Tabella 2. Le apparecchiature e le altre condizioni sperimentali valide per un particolare tipo di saggio sono descritte più avanti al paragrafo «saggio specifico».

Tabella 2. Condizioni sperimentali

Saggio	Rimozione lenta DOC	Sviluppo CO ₂	Respirometria manometrica	Screenig OCSE modif	Bottiglia chiusa	MITI (1)
Concentrazione della sostanza in esame in mg/L mg DOC/L mg ThOD/L	10-40	10-20	100 50-100	10-40	2-10 5-10	100

1.6.1. Acqua di diluizione

L'acqua deionizzata o distillata, esente da concentrazioni inibitrici di sostanze tossiche (per esempio ioni Cu^{++}), è usata come solvente. Essa deve contenere non oltre il 10 % del carbonio organico introdotto mediante il materiale in esame. L'elevata purezza dell'acqua per il saggio è necessaria per eliminare valori di bianco elevati. La contaminazione può essere dovuta a impurezze intrinseche, all'impiego di resine a scambio ionico o a materiale lisato proveniente da batteri e alghe. Per ciascuna serie di saggi usare una sola partita d'acqua, controllata preventivamente mediante analisi DOC. Detto controllo non è necessario per il saggio della bottiglia chiusa, perchè il consumo di ossigeno da parte dei microorganismi dell'acqua sia basso.

1.6.2. Soluzioni «stock» dei sali minerali

Per preparare le soluzioni per il saggio, devono essere preventivamente preparate delle soluzioni «stock» di appropriata concentrazione dei sali minerali. Possono essere usate le seguenti soluzioni «stock» (con differenti fattori di diluizione) per i metodi: rimozione lenta DOC, screening OCSE modificato, sviluppo di CO_2 , respirometria manometrica, saggio della bottiglia chiusa.

I fattori di diluizione e, per il saggio MITI, la preparazione specifica del mezzo minerale sono indicati nei saggi specifici.

Soluzioni «stock»:

Preparare le seguenti soluzioni «stock» utilizzando reagenti puri per analisi.

(a)	Diidrogenoortofosfato monopotassico, KH_2PO_4	8,50 g
	Monoidrogenoortofosfato dipotassico, K_2HPO_4	21,75 g
	Monoidrogenoortofosfato disodico diidrato $\text{Na}_2\text{HPO}_4 \cdot 2 \text{H}_2\text{O}$	33,40 g
	Cloruro d'ammonio, NH_4Cl	0,50 g

Sciogliere in acqua e portare a 1 litro il pH della soluzione deve essere 7,4

(b)	Cloruro di calcio anidro, CaCl_2	27,50 g
	o cloruro di calcio diidrato, $\text{CaCl}_2 \cdot 2 \text{H}_2\text{O}$	36,40 g
	Sciogliere in acqua e portare a 1 litro	

(c)	Solfato di magnesio eptaidrato, $\text{MgSO}_4 \cdot 7 \text{H}_2\text{O}$	22,50 g
	Sciogliere in acqua e portare a 1 litro	

(d)	Cloruro di ferro (III) esaidrato, $\text{FeCl}_3 \cdot 6 \text{H}_2\text{O}$	0,25 g
	Sciogliere in acqua e portare a 1 litro.	

Nota: allo scopo di evitare di dover preparare questa soluzione immediatamente prima dell'uso, aggiungere una goccia di HCl concentrato o 0,4 g di acido etilendiamminotetra-acetico sale disodico (EDTA) per litro.

1.6.3. Soluzioni «stock» di composti chimici

Per esempio, sciogliere da 1 a 10 g, a seconda della sostanza chimica da saggiare o di riferimento in acqua deionizzata e portare a 1 litro quando la solubilità sia superiore a 1 g/l. Altrimenti, preparare soluzioni «stock» del mezzo minerale, oppure aggiungere la sostanza chimica direttamente al mezzo minerale. Per la solubilizzazione di composti chimici poco solubili, si veda l'allegato III, ma nel saggio MITI (Metodo C.4-F), non si devono usare né solventi né emulsionanti.

1.6.4. Inoculi

L'inoculo può essere ottenuto da varie fonti: fango attivo, acque di scarico (non clorate), acque superficiali e terreni, oppure da una miscela di questi. Per i saggi di rimozione lenta del DOC, sviluppo di CO_2 , e respirometria manometrica, se si usa fango attivo esso dovrebbe essere prelevato da un impianto di trattamento o da una unità su scala di laboratorio che riceva principalmente scarichi domestici. Si è visto che gli inoculi provenienti da altre fonti danno luogo ad una dispersione maggiore dei risultati. Per lo screening OCSE modificato e per il saggio della bottiglia chiusa occorre un inoculo più diluito senza fiocchi di fango; la fonte preferita è un effluente secondario di un impianto di trattamento delle acque di rifiuto domestiche o una

rispettiva unità su scala di laboratorio. Per il saggio MITI l'inoculo viene ricavato da una miscela di fanghi di diversa provenienza ed è descritto nel paragrafo di questo saggio specifico.

1.6.4.1. *Inoculo da fanghi attivi*

Raccogliere un campione di fango attivo fresco dal serbatoio di aereazione di un impianto di trattamento o da una unità pilota di laboratorio per il trattamento delle acque di scarico che tratti prevalentemente acque di origine domestica. Rimuovere, se necessario, le particelle grossolane mediante filtrazione attraverso un setaccio fine, e quindi mantenere il fango in condizioni aerobiche.

In alternativa, decantare o centrifugare (per esempio a 1 100 g per 10 minuti) dopo la rimozione di eventuali particelle grossolane. Scartare il surnatante. Il fango può essere lavato nel mezzo minerale. Sospendere il fango concentrato in mezzo minerale per ottenere una concentrazione di 3-5 g di solidi sospesi/l e aereare fino a quando è necessario.

Il fango dovrebbe essere prelevato da un impianto convenzionale ben funzionante. Se il fango è stato preso da un impianto ad alta potenzialità o si ritiene contenga inibitori dovrebbe essere lavato. Decantare o centrifugare il fango risospeso dopo accurata miscelazione, scartare il surnatante e risospendere il fango lavato in un volume ulteriore di terreno minerale. Ripetere questa procedura fino a quando il fango può essere considerato esente da eccesso di substrato e da inibitori.

Dopo avere ottenuto la completa risospensione, con fango non trattato, prelevare un'aliquota prima dell'uso per la determinazione del peso secco dei solidi sospesi.

Un'ulteriore alternativa è quella di omogeneizzare il fango attivo (3-5 g di solidi sospesi/l). Trattare il fango in un miscelatore meccanico per due minuti a velocità media. Decantare il fango miscelato per 30 minuti, o più a lungo se necessario, e utilizzare il liquido sovrastante per l'uso come inoculo nel rapporto di 10 ml/l nel mezzo minerale.

1.6.4.2. *Altre fonti di inoculo*

Esso può essere ottenuto da un effluente secondario di un impianto di trattamento o da una unità pilota di laboratorio che riceve prevalentemente scarichi domestici. Raccogliere un campione fresco e mantenerlo in condizioni aerobiche durante il trasporto. Lasciare decantare per 1 ora o filtrare con carta da filtro grossolana e mantenere l'effluente decantato o il filtrato in condizioni aerobiche fino a quando è necessario. Si possono usare fino a 100 ml di questo tipo di inoculo per litro di mezzo minerale.

Una fonte alternativa per l'inoculo è l'acqua superficiale. In questo caso, raccogliere un'adeguata quantità di campione acqua superficiale, per esempio acqua di fiume, di lago, e mantenerla in condizioni aerobiche fino a quando è necessario. Se è il caso, concentrare l'inoculo mediante filtrazione o centrifugazione.

1.6.5. *Precondizionamento degli inoculi*

Gli inoculi possono essere precondizionati alle condizioni sperimentali, ma non preadattati al composto chimico in esame. Il precondizionamento consiste nell'aereare fango attivo nel mezzo minerale o effluente secondario per 5-7 giorni alla temperatura di prova. Il precondizionamento migliora talvolta la precisione dei metodi sperimentali riducendo i valori del bianco. Si ritiene non necessario precondizionare l'inoculo nel metodo MITI.

1.6.6. *Controlli abiotici*

Quando è necessario, controllare la possibile degradazione abiotica della sostanza in esame determinando la rimozione di DOC, l'assorbimento di ossigeno o lo sviluppo di biossido di carbonio in controlli sterili che non contengono inoculo. La sterilizzazione può essere fatta mediante filtrazione attraverso una membrana (0,2-0,45 micrometri), mediante l'aggiunta di una sostanza tossica di idonea concentrazione. Se viene usata una membrana filtrante, prelevare i campioni in modo asettico per mantenerli sterili. A meno che l'adsorbimento della sostanza chimica saggiata non sia risultato precedentemente assente, i saggi che misurano la biodegradazione come rimozione del DOC (carbonio organico disciolto), specialmente con inoculi a fanghi attivi, dovrebbero includere un controllo abiotico con inoculo tossico.

1 6 7 Numero di contenitori usati in un saggio tipo

Il numero di contenitori usati in una prova tipo è descritto nei rispettivi metodi di ciascun saggio

Possono essere usati i seguenti tipi di contenitori

sospensione	contenente la sostanza per il saggio e l'inoculo
bianco	contenente solo l'inoculo
controllo	contenente la sostanza di riferimento e l'inoculo
controllo abiotico sterile	contenente la sostanza per il saggio sterile (vedi 1 6 6)
controllo dell'adsorbimento	contenente la sostanza per il saggio, l'inoculo e l'agente sterilizzante
controllo della tossicità	contenente la sostanza per il saggio, la sostanza di riferimento e l'inoculo

Le determinazioni nella sospensione in esame e nel bianco dovrebbero essere fatti in parallelo. È consigliabile effettuare le determinazioni in parallelo negli altri contenitori al meglio

Tuttavia ciò non sempre è possibile. Assicurarsi che vengano prelevati un numero sufficiente di campioni o vengano effettuate un numero sufficiente di letture per permettere di valutare la rimozione percentuale nell'arco di 10 giorni

1 7 DATI E VALUTAZIONE

Nel calcolo della degradazione percentuale (D_t), si utilizzano i valori medi delle misure in doppio del parametro significativo nei recipienti di prova e nel bianco dell'inoculo. Le formule sono rappresentate nei paragrafi relativi ai saggi specifici. L'andamento della degradazione viene illustrato graficamente e con l'indicazione della fase di crescita (time window) di 10 giorni. Calcolare e riportare la rimozione percentuale ottenuta al termine della fase di crescita (time window) di 10 giorni e il valore raggiunto nella fase di stabilizzazione o al termine della prova, a seconda dei casi

Nelle prove respirometriche, i composti che contengono azoto possono influire sul consumo di ossigeno a causa della nitrificazione (si vedano gli allegati II e V)

1 7 1 Misura della degradazione mediante determinazione del DOC

La percentuale di degradazione nel tempo (D_t) dovrebbe essere calcolata separatamente nei recipienti contenenti la sostanza da esaminare usando i valori medi della misura in doppio del DOC perché il saggio possa avere significato. Ciò può essere calcolato usando la seguente equazione

$$D_t = \left(1 - \frac{C_t - C_{bo}}{C_o - C_{bo}} \right) \times 100$$

dove

D_t = degradazione % al tempo t,

C_o = concentrazione iniziale media di DOC nel mezzo di coltura inoculato contenente la sostanza in esame (mg DOC/l),

C_t = concentrazione media di DOC nel mezzo di coltura inoculato contenente la sostanza in esame al tempo t (mg DOC/l),

C_{bo} = concentrazione media iniziale di DOC nel bianco del mezzo minerale inoculato (mg DOC/l),

C_{bt} = concentrazione media di DOC nel bianco del mezzo minerale inoculato al tempo t (mg DOC/l)

Tutte le concentrazioni sono misurate sperimentalmente

172 Misura della degradazione mediante analisi specifica

Quando sono disponibili dati analitici specifici, calcolare la degradazione biologica primaria dalla relazione

$$D_t = \frac{S_b - S_a}{S_b} \times 100$$

D_t = degradazione % al tempo t , normalmente 28 giorni,

S_a = quantità residua di sostanza in esame nel terreno inoculato al termine della prova (mg),

S_b = quantità residua di sostanza in esame nella prova in bianco con acqua/mezzo minerale a cui è stata aggiunta solo la sostanza in esame (mg)

173 Degradazione abiotica

Se è usato un controllo abiotico sterile, calcolare la percentuale di degradazione abiotica usando

$$\% \text{ di degradazione abiotica} = \frac{C_{s(0)} - C_{s(t)}}{C_{s(0)}} \times 100$$

dove

$C_{s(0)}$ = concentrazione del DOC nel controllo sterile al giorno 0,

$C_{s(t)}$ = concentrazione del DOC nel controllo sterile al giorno t

18 RELAZIONE

La relazione del saggio deve, se possibile, contenere le seguenti informazioni

- sostanze chimiche sperimentali di riferimento, e loro purezza,
- condizioni del saggio,
- inoculo: natura e località del campionamento, concentrazione ed eventuale trattamento di precondizionamento,
- proporzione e natura degli effluenti industriali presenti nelle acque di scarico, se note,
- tempi di conduzione del saggio e temperatura,
- nel caso di sostanze chimiche scarsamente solubili, il tipo di trattamento adottato,
- metodo di saggio applicato; dovrebbero essere fornite ragioni scientifiche e una spiegazione per eventuali modifiche alla procedura,
- registrazione dei dati,
- dovrebbero essere indicati eventuali fenomeni di inibizione osservati,
- eventuale degradazione abiotica osservata,
- dati analitici chimici specifici, se disponibili,
- dati analitici sugli intermedi, se disponibili,
- grafico della degradazione percentuale in funzione del tempo per le sostanze in esame e per quelle di riferimento, la fase di latenza, la fase di degradazione, la fase di crescita (time window) di 10 giorni e la pendenza devono essere indicate chiaramente (allegato I). Se il saggio ha rispettato il criterio di validità, per il grafico può essere usata la media della percentuale di degradazione dei recipienti contenenti la sostanza da esaminare,
- la rimozione percentuale dopo la fase di crescita (time window) di 10 giorni, nonché la stabilizzazione o il termine della prova

PARTE II. SAGGIO DI RIMOZIONE LENTA DEL DOC (Metodo C 4-A)**II 1 PRINCIPIO DEL METODO**

Un volume misurato del mezzo minerale inoculato, contenente una concentrazione nota della sostanza in esame (10-40 mg DOC/l) come unica fonte nominale di carbonio organico, viene incubato al buio o in luce diffusa a $22 \pm 2^\circ\text{C}$.

La degradazione viene seguita mediante analisi del DOC a intervalli regolari in un arco di tempo di oltre 28 giorni. Il grado di biodegradazione viene calcolato esprimendo la concentrazione di DOC rimossa (corretta del bianco di controllo dell'inoculo) in percento di concentrazione presente inizialmente. Il grado di degradazione biologica primaria può anche essere calcolato da una analisi chimica supplementare effettuata all'inizio e al termine dell'incubazione.

II 2 DESCRIZIONE DEL METODO**II 2.1 Apparecchiatura**

- a) Beute, per esempio, da 250 ml a 2 litri, secondo il volume necessario per l'analisi DOC,
- b) tavola di agitazione — in grado di accogliere le beute, con controllo automatico della temperatura oppure disposta in un ambiente a temperatura costante — e di potenza tale da mantenere le condizioni aerobiche in tutte le beute,
- c) apparecchio di filtrazione con membrane adatte,
- d) analizzatore di DOC,
- e) apparecchio per determinare l'ossigeno disciolto,
- f) centrifuga.

II 2.2 Preparazione del mezzo minerale

Per la preparazione delle soluzioni concentrate vedi I 6.2.

Miscelare 10 ml di soluzione (a) con 800 ml di acqua di diluizione, aggiungere 1 ml di soluzioni di (b) a (d) e portare a 1 litro con acqua di diluizione.

II 2.3 Preparazione e precondizionamento dell'inoculo

L'inoculo può essere ottenuto da varie fonti: fango attivo, acque di scarico, acque superficiali e terreni oppure da una miscela di questi.

Vedi I 6.4, I 6.4.1, I 6.4.2 e I 6.5.

II 2.4 Preparazione delle beute

Introdurre, per esempio, porzioni da 800 ml di mezzo minerale in beute da 2 litri e aggiungere volumi sufficienti di soluzioni concentrate delle sostanze in esame e di riferimento a beute separate in modo da ottenere una concentrazione di sostanza chimica equivalente a 10-40 mg DOC/l. Controllare il valore del pH e correggerlo, se necessario, a $\text{pH} = 7,4$. Inoculare i palloni con fango attivo o altra fonte di inoculo (vedi I 6.4), in modo da ottenere una concentrazione finale non superiore a 30 mg di solidi sospesi/l. Preparare inoltre controlli di inoculo in mezzo minerale senza il composto chimico in esame né quello di riferimento.

Se necessario, usare un recipiente per controllare il possibile effetto inibitore della sostanza chimica in esame inoculando una soluzione contenente, nel mezzo minerale, concentrazioni confrontabili della sostanza chimica in esame e di quella di riferimento.

Inoltre, se richiesto, preparare un'ulteriore beuta sterile per controllare se la sostanza chimica in esame venga degradata abioticamente utilizzando una soluzione non inoculata della sostanza chimica (vedi I 6.6).

In aggiunta, se si sospetta che la sostanza chimica in esame sia adsorbita in modo significativo sul vetro, sul fango etc., effettuare una valutazione preliminare per determinare il grado probabile di adsorbimento e quindi l'idoneità del saggio per il composto chimico (vedi Tabella 1). Preparazione di un recipiente contenente la sostanza da esaminare, l'inoculo e l'agente sterilizzante.

Portare i volumi in tutte le beute a 1 l con mezzo minerale, e, dopo miscelazione, prelevare un campione da ciascuna beuta per determinare la concentrazione iniziale di DOC (vedi allegato II.4). Coprire le aperture delle beute, per esempio, con un foglio di alluminio, in modo da permettere uno scambio libero di aria tra la beuta e l'atmosfera circostante. Inserire poi i contenitori nella tavola di agitazione e avviare il saggio.

II.2.5. Numero di contenitori usati in un saggio tipo

Recipiente 1 e 2: sospensione

Recipiente 3 e 4: bianco con inoculo

Recipiente 5: controllo

preferibilmente se è necessario:

Recipiente 6: controllo abiotico sterile

Recipiente 7: controllo per l'adsorbimento

Recipiente 8: controllo per la tossicità

Vedi I.6.7.

II.2.6. Esecuzione del saggio

Durante l'esecuzione del saggio, determinare la concentrazione di DOC in ciascuna beuta, in doppio, a intervalli di tempo noti, in modo sufficientemente regolare per poter determinare il momento di inizio della fase di crescita (time window) di 10 giorni e la rimozione percentuale al termine della fase di crescita (time window) di 10 giorni. Prelevare solo il volume minimo necessario di sospensione di prova per ciascuna determinazione.

Prima del campionamento, compensare le perdite per evaporazione dalle beute mediante l'aggiunta di acqua di diluizione (I.6.1) nella quantità richiesta, se necessario. Miscelare il mezzo di coltura accuratamente prima di prelevare un campione e assicurarsi che il materiale eventualmente aderente alle pareti dei recipienti sia disciolto o sospeso prima del campionamento. Filtrare su membrana o centrifugare (vedi allegato II.4) immediatamente dopo aver prelevato il campione. Analizzare i campioni filtrati e centrifugati lo stesso giorno, altrimenti conservarli a 2-4 °C per un massimo di 48 ore o al di sotto di -18°C per un periodo più lungo.

II.3. DATI E RELAZIONE

II.3.1. Modalità di esposizione dei risultati

Calcolare la degradazione percentuale al tempo t come indicato al punto I.7.1. (determinazione del DOC) e (analisi specifica) punto I.7.2. facoltativa.

Trascrivere tutti i risultati su moduli predisposti.

II.3.2. Validità dei risultati

Vedi I.5.2.

II.3.3. RELAZIONE

Vedi I.8.

PARTE III SAGGIO DI SCREENING OCSE MODIFICATO (Metodo C 4 B)

III.1 PRINCIPIO DEL METODO

Un volume noto di mezzo minerale contenente una concentrazione nota della sostanza in esame (10-40 mg DOC/l) come unica fonte nominale di carbonio organico viene inoculato con 0,5 ml di effluente per litro di mezzo minerale. La miscela viene aerata al buio o in luce diffusa a 22 ± 2 °C.

La degradazione viene seguita mediante analisi del DOC a intervalli regolari in un arco di tempo di 28 giorni. Il grado di biodegradazione viene calcolato esprimendo la concentrazione di DOC rimossa (corretta del bianco di controllo dell'inoculo) in percento della concentrazione presente inizialmente. Il grado di degradazione biologica primaria può anche essere calcolato mediante analisi chimica supplementare effettuata all'inizio e al termine dell'incubazione.

III 2 DESCRIZIONE DEL METODO

III.2.1 Apparecchiatura

- a) Beute, per esempio da 250 ml a 2 litri, secondo il volume necessario per l'analisi del DOC;
- b) tavola di agitazione — in grado di accogliere le beute, con controllo automatico della temperatura oppure disposta in un ambiente a temperatura costante — e di potenza sufficiente a mantenere le condizioni aerobiche in tutte le beute;
- c) apparecchio di filtrazione con membrane adatte;
- d) analizzatore di DOC;
- e) apparecchio per determinare l'ossigeno disciolto;
- f) centrifuga

III.2.2 Preparazione del mezzo minerale

Per la preparazione delle soluzioni concentrate vedi I.6.2.

Miscelare 10 ml di soluzione (a) con 800 ml di acqua di diluizione, aggiungere 1 ml di soluzioni da (b) a (d) e portare a 1 litro con acqua di diluizione.

In questo metodo si utilizzano solo 0,5 ml di effluente/litro come inoculo e pertanto può essere necessario integrare il terreno con oligoelementi e fattori di crescita aggiungendo 1 ml per ciascuna delle seguenti soluzioni per litro di terreno finale.

Soluzione di oligoelementi:

Solfato di manganese tetraidrato, $\text{MnSO}_4 \cdot 4\text{H}_2\text{O}$	39,9 mg
Acido borico, H_3BO_3	57,2 mg
Solfato di zinco eptaidrato, $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$	42,8 mg
Eptamolibdato d'ammonio, $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24}$	34,7 mg
Chelato di Fe (FeCl_3 acido etilendiammino-tetraacetico)	100,0 mg

Sciogliere in un matraccio e portare a 1 000 ml con acqua di diluizione.

Soluzione di vitamine:

Estratto di lievito 15,0 mg

Sciogliere l'estratto di lievito in 100 ml di acqua e sterilizzare attraverso una membrana da 0,2 micron, preparare la soluzione al momento dell'uso.

III 2.3. Preparazione e precondizionamento dell'inoculo

L'inoculo è ottenuto da un effluente secondario di un impianto di trattamento o da un'unità pilota di laboratorio alimentata prevalentemente da scarichi domestici. È usato in ragione di 0,5 ml/l di mezzo minerale. Vedi I.6.4.2. e I.6.5.

III.2.4. Preparazione dei contenitori

Introdurre, per esempio, porzioni da 800 ml di mezzo minerale in beute da 2 litri e aggiungere volumi sufficienti di soluzioni stock delle sostanze in esame e di riferimento a beute separate in modo da ottenere una concentrazione di sostanza chimica equivalente a 10-40 mg DOC/l. Controllare il valore del pH e correggerlo, se necessario, a pH = 7,4. Inoculare le beute con effluente di acque di scarico (0,5 ml/litro) (vedi I.6.4.2.). Preparare inoltre controlli dell'inoculo nel mezzo minerale senza le sostanze chimiche in esame e di riferimento.

Se necessario, usare un recipiente per controllare il possibile effetto inibitore della sostanza chimica in esame inoculando una soluzione contenente, nel mezzo minerale, concentrazioni confrontabili della sostanza chimica in esame e di quella di riferimento.

Inoltre, se richiesto, preparare un'ulteriore beuta sterile per controllare se la sostanza chimica in esame venga degradata abioticamente utilizzando una soluzione non inoculata della sostanza chimica (vedi I 6 6)

In aggiunta, se si sospetta che la sostanza chimica in esame sia adsorbita in modo significativo sul vetro, sul fango ecc, effettuare una valutazione preliminare per determinare il grado probabile di adsorbimento e quindi l'idoneità del saggio per il composto chimico (vedi Tabella 1) Preparazione di un recipiente contenente la sostanza da esaminare, l'inoculo e l'agente sterilizzante

Portare i volumi in tutte le beute a 1 l con mezzo minerale, e, dopo miscelazione, prelevare un campione da ciascuna beuta per determinare la concentrazione iniziale di DOC (vedi allegato II 4) Coprire le aperture delle beute, per esempio con un foglio di alluminio, in modo da permettere uno scambio libero di aria tra la beuta e l'atmosfera circostante Inserire poi i recipienti nella tavola di agitazione e avviare il saggio

III 2 5 Numero di contenitori usati in una prova tipo

Recipiente 1 e 2 sospensione

Recipiente 3 e 4 bianco con inoculo

Recipiente 5 controllo

preferibilmente se è necessario

Recipiente 6 controllo abiotico sterile

Recipiente 7 controllo per l'adsorbimento

Recipiente 8 controllo per la tossicità

Vedi I 6 7

III 2 6 Esecuzione del saggio

Durante l'esecuzione del saggio, determinare la concentrazione di DOC in ciascuna beuta, in doppio, a intervalli di tempo noti, in modo sufficientemente regolare per poter determinare il momento di inizio della fase di crescita (time window) di 10 giorni e la rimozione percentuale al termine della fase di crescita (time window) di 10 giorni Prelevare solo il volume minimo necessario di sospensione di prova per ciascuna determinazione

Prima del campionamento, compensare le perdite per evaporazione dalle beute mediante l'aggiunta di acqua di diluizione (I 6 1), se necessario, nella quantità richiesta Miscelare il mezzo di coltura accuratamente prima di prelevare un campione e assicurarsi che il materiale eventualmente aderente alle pareti dei recipienti sia disciolto o sospeso prima del campionamento Filtrare su membrana o centrifugare (vedi allegato II 4) immediatamente dopo aver prelevato il campione Analizzare i campioni filtrati e centrifugati lo stesso giorno, altrimenti conservarli a 2-4 °C per un massimo di 48 ore o al di sotto di -18 °C per un periodo più lungo

III 3 DATI E RELAZIONE

III 3 1 Trattamento dei risultati

Calcolare la degradazione percentuale al tempo t come indicato al punto I 7 1 (determinazione del DOC) e, facoltativamente, al punto I 7 2 (analisi specifica)

PARTE IV SAGGIO DI SVILUPPO DEL CO₂ (Metodo C 4 C)

IV 1 PRINCIPIO DEL METODO

Un volume misurato di mezzo minerale inoculato contenente una concentrazione nota della sostanza chimica in esame (10-20 mg DOC o TOC/l) come unica fonte nominale di carbonio organico, viene aerato mediante il passaggio di aria esente da biossido di carbonio ad una portata controllata, al buio o a luce diffusa. La degradazione viene seguita per 28 giorni determinando il biossido di carbonio prodotto, che viene assorbito su idrossido di bario o di sodio e che viene misurato per titolazione dell'idrossido di bario residuo o come carbonio inorganico. La quantità di biossido di carbonio prodotta dalla sostanza chimica in esame (corretta, per tener conto di quella derivante dal bianco dell'inoculo) viene espressa come percentuale di ThCO₂. Il grado di degradazione biologica può anche essere calcolato da un'analisi DOC supplementare effettuata all'inizio e al termine dell'incubazione.

IV 2 DESCRIZIONE DEL METODO

IV 2.1 Apparecchiatura

- a) Palloni, 2,5 litri, dotati ciascuno di un tubo di aerazione che giunge quasi al fondo del recipiente e di una uscita,
- b) agitatori magnetici quando la valutazione viene effettuata su sostanze chimiche scarsamente solubili,
- c) bottiglie per l'assorbimento di gas,
- d) dispositivo per controllare e misurare il flusso d'aria,
- e) apparecchio per la rimozione del biossido di carbonio per la preparazione d'aria esente da biossido di carbonio, in alternativa, una miscela di ossigeno esente da CO₂ e azoto esente da CO₂ prelevata da bombole di gas nelle proporzioni corrette (20 % O₂ 80 % N₂),
- f) dispositivo per la determinazione del biossido di carbonio, o per titolazione o mediante qualche tipo di analizzatore del carbonio inorganico,
- g) dispositivo di filtrazione su membrana (facoltativo),
- h) analizzatore del DOC (facoltativo).

IV 2.2 Preparazione del mezzo minerale

Per la preparazione delle soluzioni concentrate vedi I 6.2

Miscelare 10 ml di soluzione (a) con 800 ml di acqua di diluizione, aggiungere 1 ml di soluzioni di (b) a (d) e portare a 1 litro con acqua di diluizione.

IV 2.3 Preparazione e precondizionamento dell'inoculo

L'inoculo può essere ottenuto da varie fonti: fango attivo, acque di scarico, acque superficiali e terreni oppure da una miscela di questi.

Vedi I 6.4, I 6.4.1, I 6.4.2 e I 6.5

IV 2.4 Preparazione dei contenitori

Per esempio, i seguenti volumi e pesi indicano i valori per palloni da 5 litri contenenti 3 litri di sospensione. Se si utilizzano volumi più piccoli, modificare proporzionalmente i valori, ma assicurarsi che il biossido di carbonio formato possa venire misurato con accuratezza.

In ciascun pallone da 5 litri introdurre 2.400 ml di mezzo minerale. Aggiungere un volume appropriato del fango attivo preparato (vedi I 6.4.1 e I 6.5) in modo da ottenere una concentrazione di solidi sospesi non maggiore di 30 mg/l nei 3 litri finali di miscela inoculata. In alternativa, diluire per prima cosa il fango attivo

preparato in modo da ottenere una sospensione a 500-1 000 mg/l nel mezzo minerale prima di aggiungerne un'aliquota al contenuto del pallone da 5 litri per realizzare una concentrazione di 30 mg/l, questo assicura una maggior precisione. E' possibile usare altre fonti di inoculo (vedi I 6 4 2).

Aerare queste miscele inoculate con aria esente da CO_2 per una notte in modo da bonificare il sistema dal biossido di carbonio.

Aggiungere il materiale in esame e la sostanza di riferimento, separatamente, come volumi noti delle soluzioni concentrate ai palloni in multiplo, in modo da ottenere concentrazioni, fornite dalle sostanze chimiche aggiunte, da 10 a 20 mg di DOC o TOC/l, lasciare alcuni palloni senza aggiunta di sostanze chimiche come controlli dell'inoculo. Aggiungere le sostanze chimiche in esame, scarsamente solubili, direttamente nei palloni in una percentuale in peso o in volume, oppure trattarle come descritto nell'allegato III.

Se richiesto, usare un pallone per controllare il possibile effetto inibitore della soluzione chimica in esame aggiungendo le sostanze chimiche in esame e di riferimento alle stesse concentrazioni alle quali sono presenti negli altri palloni.

Inoltre, se richiesto, utilizzare un pallone sterile per controllare se la sostanza chimica in esame venga degradata abioticamente, utilizzando una soluzione non inoculata della sostanza chimica (vedi I 6 6). Sterilizzare mediante l'aggiunta di una sostanza tossica ad una idonea concentrazione.

Portare i volumi delle sospensioni in tutti i palloni a 3 l mediante l'aggiunta del mezzo minerale preventivamente aerato con aria esente da CO_2 . In alternativa, si possono prelevare dei campioni per l'analisi del DOC (vedi allegato II 4) e/o per l'analisi specifica. Collegare le bottiglie di assorbimento alle uscite dell'aria dei palloni.

Se si utilizza idrossido di bario, collegare tre bottiglie di assorbimento, contenenti ciascuna 100 ml di soluzione 0,0125 M di idrossido di bario, in serie con ciascun pallone da 5 l. La soluzione deve essere esente da solfati e carbonati precipitati e la sua concentrazione deve essere determinata immediatamente prima dell'uso. Se si utilizza idrossido di sodio, collegare due recipienti di cattura, dove il secondo agisce da controllo per verificare che tutto il biossido di carbonio è stato assorbito nel primo. Sono adatte bottiglie di assorbimento con chiusure per bottiglie da siero. Aggiungere 200 ml di idrossido di sodio 0,05 M a ciascuna bottiglia, quantità sufficiente per assorbire la quantità totale di biossido di carbonio sviluppata quando la sostanza chimica in esame è completamente degradata. La soluzione di idrossido di sodio, anche quando è stata preparata di fresco, conterrà tracce di carbonati, questo valore viene corretto sottraendo il carbonato contenuto nel bianco.

IV 2 5 Numero di palloni usati in un saggio tipo

Recipiente 1 e 2: sospensioni

Recipiente 3 e 4: bianco con inoculo

Recipiente 5: controllo

preferibilmente se è necessario

Recipiente 6: controllo abiotico sterile

Recipiente 7: controllo per la tossicità

Vedi I 6 7

IV 2 6 Esecuzione del saggio

Iniziare la prova facendo gorgogliare aria esente da CO_2 attraverso le sospensioni ad una portata di 30-100 ml/min. Prelevare periodicamente dei campioni dal contenitore che assorbe il biossido di carbonio per l'analisi del contenuto di CO_2 . Durante i primi 10 giorni si raccomanda di effettuare l'analisi ogni due o tre giorni, poi ogni cinque giorni fino al ventottesimo giorno in modo da poter identificare la fase di crescita (time window) di 10 giorni.

Al ventottesimo giorno, prelevare dei campioni (facoltativamente) per l'analisi del DOC e/o l'analisi specifica, misurare il pH delle sospensioni e aggiungere 1 ml di acido cloridrico concentrato a ciascun contenitore, aerare i contenitori per una notte per scacciare il biossido di carbonio presente nelle sospensioni in esame. Al giorno ventunesimo eseguire l'ultima analisi del biossido di carbonio sviluppato.

Nei giorni di misura del CO₂, scollegare l'assorbitore dell'idrossido di bario più vicino al pallone e titolare la soluzione di idrossido con HCl 0,05 M utilizzando fenolftaleina come indicatore. Spostare gli assorbitori rimanenti di un posto verso il pallone e porre un nuovo assorbitore contenente 100 ml di idrossido di bario 0,0125 M fresco all'estremità più lontana della serie. Effettuare le titolazioni quando necessario, per esempio quando si vede una sostanziale precipitazione nella prima trappola e prima che sia evidente una precipitazione nella seconda, oppure almeno ogni settimana. In alternativa, con NaOH come assorbente, prelevare con una siringa una piccola aliquota di campione (secondo le caratteristiche dell'analizzatore di carbonio usato) della soluzione di idrossido di sodio nell'assorbitore più vicino al pallone. Iniettare il campione nella parte per il carbonio inorganico dell'analizzatore di carbonio ed effettuare direttamente l'analisi del biossido di carbonio sviluppato.

Analizzare il contenuto della seconda trappola solo al termine del saggio per correggere eventuali trascinamenti di biossido di carbonio.

IV 3 DATI E RELAZIONE

IV 3.1 Modalità di esposizione dei risultati

La quantità di CO₂ catturata nell'assorbitore al momento della titolazione è data da

$$\text{mg CO}_2 = (100 \times C_B - 0,5 \times V \times C_A) \times 44$$

in cui

V = volume di HCl utilizzato per la titolazione dei 100 ml nell'assorbitore (ml),

C_B = concentrazione della soluzione di idrossido di bario (M),

C_A = concentrazione della soluzione di acido cloridrico (M),

se C_B è 0,0125 M e C_A è 0,05 M, la titolazione per 100 ml di idrossido di bario e 50 ml e il peso di CO₂ è dato da

$$\frac{0,05}{2} \times 44 \times \text{ml HCl titolato} = 1,1 \times \text{ml HCl}$$

Così, in questo caso, il fattore di conversione del volume di HCl titolato in mg di CO₂ prodotta è 1,1

Calcolare i pesi di CO₂ prodotto dall'inoculo da solo e dall'inoculo più la sostanza chimica in esame utilizzando i rispettivi valori di titolazione, la differenza e il peso di CO₂ prodotto dalla sostanza chimica in esame di sola.

Per esempio, se l'inoculo da solo fornisce una titolazione di 48 ml e l'inoculo più sostanza chimica in esame fornisce 45 ml

$$\text{CO}_2 \text{ dall'inoculo} = 1,1 \times (50-48) = 2,2 \text{ mg}$$

$$\text{CO}_2 \text{ dall'inoculo più sostanza chimica in esame} = 1,1 \times (50-45) = 5,5 \text{ mg}$$

e così il peso di CO₂ prodotto dalla sostanza chimica in esame è 3,3 mg

La degradazione biologica percentuale si calcola da

$$\% \text{ degradazione} = \frac{\text{mg CO}_2 \text{ prodotti} \times 100}{\text{ThCO}_2 \text{ prodotti} \times \text{mg di sostanza chimica in esame aggiunta}}$$

o,

$$\% \text{ degradazione} = \frac{\text{mg CO}_2 \text{ prodotti} \times 100}{\text{mg TOC aggiunti nella prova} \times 3,67}$$

dove 3,67 è il fattore di conversione (44/12) da carbonio a biossido di carbonio

Ricavare la degradazione percentuale dopo ogni intervallo di tempo aggiungendo la percentuale dei valori di ThCO_2 calcolati per ciascuno dei giorni in cui è stata misurata fino a quel momento

Per gli assorbitori all'idrossido di sodio, calcolare la quantità di biossido di carbonio prodotto (espressa come IC (mg)), moltiplicando la concentrazione di IC nell'assorbente per il volume dell'assorbente

Calcolare la degradazione percentuale dalla

$$\% \text{ThCO}_2 = \frac{\text{mg IC del pallone di prova} - \text{mg IC del bianco}}{\text{mg TOC aggiunti come sostanza chimica in esame}} \times 100$$

Calcolare il grado di rimozione del DOC (facoltativo) come descritto al punto 1.7. Registrare questi risultati, e tutti gli altri, sui registri forniti

IV 3.2 Validità dei risultati

Il contenuto di carbonio inorganico nella sospensione della sostanza chimica in esame nel mezzo minerale all'inizio della prova deve essere minore del 5 % del carbonio totale e lo sviluppo totale di CO_2 nel bianco dell'inoculo al termine della prova non dovrebbe normalmente superare i 40 mg/l di terreno. Se si ottengono valori maggiori di 70 mg CO_2 /l, si dovrebbero esaminare criticamente i dati e la tecnica sperimentale

7 DEGRADAZIONE ABIOTICA (facoltativa)

$$\% \text{ degradazione abiotica} = \frac{\text{Formazione di CO}_2 \text{ contenitore sterile dopo 28 giorni (mg)}}{\text{ThCO}_2 \text{ (mg)}} \times 100$$

PARTE V SAGGIO RESPIROMETRICO MANOMETRICO (Metodo C 4-D)**V 1 PRINCIPIO DEL METODO**

Un volume misurato di mezzo minerale inoculato, contenente una concentrazione nota della sostanza chimica in esame (100 mg/l della sostanza chimica in esame in modo da fornire almeno 50-100 mg ThOD/l) come unica fonte nominale di carbonio organico, viene tenuto sotto agitazione in un contenitore chiuso a temperatura costante ($\pm 1^\circ\text{C}$ o meno) per un tempo fino a 28 giorni. Il consumo di ossigeno viene determinato o misurando la quantità di ossigeno (prodotto elettroliticamente) necessario per mantenere costante il volume di gas nel contenitore del respirometro, oppure dalla variazione di volume o di pressione (o da una combinazione delle due variazioni) nell'apparecchiatura. Il biossido di carbonio sviluppato viene assorbito in una soluzione di idrossido di potassio o un altro assorbente adatto. La quantità di ossigeno consumata dalla sostanza chimica in esame (corretta del consumo del bianco dell'inoculo, controllato in parallelo) viene espressa in percentuale di ThOD o COD. In alternativa, la degradazione primaria può anche essere calcolata mediante analisi specifica supplementare fatta all'inizio e alla fine dell'incubazione e la degradazione ultima mediante analisi del DOC.

V 2 DESCRIZIONE DEL METODO**V 2.1 Apparecchiatura**

- a) Adatto respirometro,
- b) sistema di regolazione della temperatura che mantenga $\pm 1^\circ\text{C}$, o meglio,
- c) dispositivo di filtrazione su membrana (facoltativo),
- d) analizzatore di carbonio (facoltativo)

V 2.2 Preparazione del mezzo minerale

Per la preparazione delle soluzioni concentrate vedi I 6.2

Miscelare 10 ml di soluzione (a) con 800 ml di acqua di diluizione, aggiungere 1 ml di soluzioni da (b) a (d) e portare a 1 litro con acqua di diluizione

V 2.3 Preparazione e precondizionamento dell'inoculo

L'inoculo può essere ottenuto da varie fonti: fango attivo, acque di scarico, acque superficiali e terreni, oppure da una miscela di questi.

Vedi I 6.4, I 6.4.1, I 6.4.2 e I 6.5

V 2.4 Preparazione dei contenitori

Preparare separatamente le soluzioni delle sostanze chimiche in esame e di riferimento nel mezzo minerale, normalmente equivalenti ad una concentrazione di 100 mg di sostanza chimica/l (che forniscono almeno 50-100 mg ThOD/l) utilizzando le soluzioni concentrate (stock).

Calcolare la ThOD sulla base della formazione di sali di ammonio, salvo che si preveda una nitrificazione: nel qual caso il calcolo dovrebbe essere basato sulla formazione di nitrati (vedi allegato II.2).

Determinare i valori di pH e, se necessario, regolare a $\text{pH} = 7,4 \pm 0,2$.

Sostanze scarsamente solubili dovrebbero essere aggiunte in una fase più avanzata (vedi nel seguito).

Se si deve determinare la tossicità della sostanza chimica in esame, preparare una ulteriore soluzione nel mezzo minerale contenente sia la sostanza chimica in esame che quella di riferimento alle stesse concentrazioni delle singole soluzioni.

Se è richiesta una misura dell'assorbimento chimico-fisico dell'ossigeno, preparare una soluzione sterile della sostanza chimica in esame ad una concentrazione, normalmente, di 100 mg ThOD/l mediante aggiunta di un'adeguata sostanza tossica (vedi I 6.6).

Introdurre il volume richiesto di soluzione delle sostanze chimiche rispettivamente in esame e di riferimento, in contenitori almeno in doppio. Aggiungere ad ulteriori contenitori il mezzo minerale da solo (per i controlli dell'inoculo) e, se richiesto, la soluzione mista della sostanza chimica di prova/riferimento e la soluzione sterile.

Se la sostanza chimica in esame è scarsamente solubile, aggiungerla direttamente a questo stadio, in ragione del peso o del volume, oppure trattarla come descritto nell'allegato III. Nel comparto di assorbimento dell'O₂ aggiungere idrossido di potassio, pastiglie di calce sodata o altro assorbente.

V 2.5 Numero di contenitori usati in un saggio tipo

Recipiente 1 e 2 sospensione

Recipiente 3 e 4 bianco con inoculo

Recipiente 5 controllo

preferibilmente se è necessario

Recipiente 6 controllo sterile

Recipiente 7 controllo per la tossicità

Vedi I 6.7

V 2.6 Esecuzione del saggio

Aspettare che i contenitori abbiano raggiunto la temperatura desiderata, inoculare i recipienti appropriati con fango attivo preparato o altra fonte di inoculo in modo da ottenere una concentrazione di solidi sospesi non superiore a 30 mg/l. Montare l'apparecchiatura, avviare l'agitatore e controllare la tenuta nei confronti dell'aria, e iniziare la misura del consumo di ossigeno. Di solito non sono richieste ulteriori attenzioni a parte quella di effettuare le necessarie letture e i controlli giornalieri per verificare che vengano mantenute la temperatura corretta ed una adeguata agitazione.

Calcolare il consumo di ossigeno con letture effettuate ad intervalli regolari e frequenti, utilizzando i metodi forniti dal fabbricante dell'apparecchiatura. Al termine dell'incubazione, non oltre 28 giorni, misurare il pH del contenuto dei contenitori, soprattutto se il consumo di ossigeno è basso o maggiore della ThOD_{NH4} (vedi composti contenenti azoto).

Se necessario, prelevare campioni dai contenitori del respirometro, all'inizio e alla fine, per l'analisi del DOC o per l'analisi chimica specifica (vedi allegato II 4). Al momento del prelievo iniziale, assicurarsi che il volume della sospensione in esame che rimane nel contenitore sia noto. Quando l'ossigeno viene consumato da una sostanza in esame contenente azoto, determinare l'aumento della concentrazione dei nitrati e dei nitrati durante i 28 giorni e calcolare la correzione per l'ossigeno consumato mediante nitrificazione (allegato V).

V 3 DATI E RELAZIONE

V 3.1 Modalità di esposizione dei risultati

Dividere il consumo di ossigeno (mg) da parte della sostanza chimica in esame dopo un tempo stabilito (corretto del controllo del bianco di inoculo dopo lo stesso tempo) per il peso della sostanza chimica in esame usata. Questo fornisce il BOD espresso come mg di ossigeno / mg di sostanza chimica in esame, cioè:

$$\text{BOD} = \frac{\text{mg O}_2 \text{ consumato dalla sostanza chimica in esame} - \text{mg O}_2 \text{ consumato dal bianco}}{\text{mg sostanza chimica in esame nel contenitore}}$$

$$= \text{mg O}_2 \text{ per mg di sostanza chimica in esame}$$

Calcolare la percentuale di degradazione biologica con una delle seguenti relazioni:

$$\% \text{ degrad. biologica} = \% \text{ ThOD} = \frac{\text{BOD (mg O}_2/\text{mg sostanza chimica)}}{\text{ThOD (mg O}_2/\text{mg sostanza chimica)}} \times 100$$

o

$$\% \text{ COD} = \frac{\text{BOD (mg O}_2/\text{mg sostanza chimica)}}{\text{COD (mg O}_2/\text{mg sostanza chimica)}} \times 100$$

Si dovrebbe notare che questi due metodi non forniscono necessariamente lo stesso valore; dei due è preferibile usare il primo.

Per le sostanze in esame che contengono azoto, utilizzare il valore appropriato di ThOD (NH_4 o NO_3) secondo quanto è noto o ci si aspetta per quanto riguarda il verificarsi della nitrificazione (allegato II.2). Se viceversa si verifica una nitrificazione non completa, effettuare una correzione che tenga conto dell'ossigeno consumato dalla nitrificazione in base alle variazioni di concentrazione dei nitriti e dei nitrati (allegato V).

Quando si effettuano determinazioni facoltative del carbonio organico e/o di una sostanza chimica specifica, calcolare la degradazione percentuale come descritto al punto I.7.

V.3.2. Validità dei risultati

Il consumo di ossigeno da parte del bianco dell'inoculo è normalmente di 20-30 $\text{mg O}_2/\text{l}$ e non dovrebbe essere maggiore di 60 mg/l in 28 giorni. Valori più elevati di 60 mg/l richiedono un esame critico dei dati e delle tecniche sperimentali. Se il valore del pH è al di fuori del campo 6-8,5 ed il consumo di ossigeno da parte della sostanza chimica in esame è minore del 60 %, si dovrebbe ripetere la prova con una minore concentrazione della sostanza chimica in esame.

PARTI VI. SAGGIO DELLA BOTTIGLIA CHIUSA (Metodo C.4-E)

VI.1 PRINCIPIO DEL METODO SPERIMENTALE

La soluzione della sostanza chimica in esame nel mezzo minerale, di solito a 2-5 mg/l, viene inoculata con un numero relativamente piccolo di microorganismi provenienti da una popolazione mista e mantenuti in bottiglie chiuse, completamente piene, al buio a temperatura costante. La degradazione viene seguita mediante l'analisi dell'ossigeno disciolto su un arco di tempo di 28 giorni. La quantità di ossigeno consumata dalla sostanza chimica in esame, corretta per tener conto del bianco dell'inoculo controllato in parallelo, è espressa in percentuale di ThOD o COD.

VI.2 DESCRIZIONE DEL METODO

VI.2.1 Apparecchiatura

- Bottiglie per BOD, con tappi di vetro, per esempio da 250-300 ml,
- bagno d'acqua o incubatore per mantenere le bottiglie a temperatura costante ($\pm 1^\circ\text{C}$ o meglio) con l'esclusione di luce,
- bottiglie di vetro grandi (2-5 l) per la preparazione dei terreni e per il riempimento delle bottiglie per BOD;
- elettrodo a ossigeno e misuratore, o apparecchiatura e reagenti per la titolazione di Winkler

VI.2.2 Preparazione del mezzo minerale

Per la preparazione della soluzione concentrata, vedi I 6.2

Miscelare 1 ml di soluzioni da (a) a (d) e portare a 1 l con acqua di diluizione

VI 2.3 Preparazione dell'inoculo

L'inoculo è normalmente proveniente da un effluente secondario di un impianto di trattamento o da una unità pilota di laboratorio alimentata prevalentemente da scarichi domestici. In alternativa una sorgente d'inoculo è un'acqua superficiale. Normalmente si usa da una goccia (0,05 ml) a 5 ml di filtrato per litro di mezzo minerale, e utile eseguire delle prove sperimentali per valutare il volume ottimale per un dato effluente (vedi I 6.4.2 e I 6.5).

VI 2.4 Preparazione dei contenitori

Aerare fortemente il mezzo minerale per almeno 20 minuti. Eseguire ogni serie di esperimenti con mezzo minerale ottenuto dalla stessa partita. In generale, il mezzo è pronto per l'uso dopo essere stato a riposo per 20 ore alla temperatura di prova. Determinare la concentrazione dell'ossigeno disciolto a scopo di controllo, il valore dovrebbe essere di circa 9 mg/l a 20 °C. Eseguire tutte le operazioni di trasferimento e di riempimento del terreno saturato con aria evitando la formazione di bolle, per esempio mediante l'uso di sifoni.

Preparare gruppi paralleli di bottiglie per BOD per la determinazione delle sostanze chimiche di prova e di riferimento in serie sperimentali simultanee. Preparare un numero sufficiente di bottiglie per BOD, includendo i bianchi dell'inoculo, per permettere di fare delle misure almeno in doppio del consumo di ossigeno agli intervalli di prova desiderati, per esempio dopo 0, 7, 14, 21 e 28 giorni. Per assicurarsi di poter identificare la fase di crescita di 10 giorni (time window), possono essere necessarie un maggior numero di bottiglie.

Aggiungere mezzo minerale completamente aerato a bottiglie grandi in modo che esse siano riempite per circa un terzo. Aggiungere poi una quantità sufficiente delle soluzioni concentrate della sostanza chimica in esame e della sostanza chimica di riferimento a bottiglie grandi separate in quantità tale che la concentrazione finale delle sostanze chimiche sia normalmente non superiore a 10 mg/l. Non aggiungere sostanze chimiche al terreno di controllo del bianco contenuto in una ulteriore bottiglia grande.

Allo scopo di garantire l'attività dell'inoculo che non sia contenuta, la concentrazione dell'ossigeno disciolto non deve scendere al di sotto di 0,5 mg/l nelle bottiglie per BOD. Questo limita la concentrazione della sostanza chimica in esame a circa 2 mg/l. Tuttavia, per composti scarsamente degradabili e per quelli con un basso ThOD, si possono usare 5-10 mg/l. In alcuni casi, è consigliabile eseguire prove su serie in parallelo della sostanza chimica a due differenti concentrazioni, per esempio 2 e 5 mg/l. Normalmente, si calcola il ThOD sulla base della formazione di sali d'ammonio ma, se è prevista la nitrificazione, si calcola sulla base della formazione di nitrato ($\text{ThOD}_{\text{NO}_3}$ - vedi allegato II.2). Tuttavia, se si verifica una nitrificazione non completa, si effettua una correzione tenendo conto delle variazioni di concentrazione di nitrito e nitrato determinate mediante analisi (vedi allegato V).

Se si deve studiare la tossicità della sostanza chimica in esame (nel caso per esempio sia stato trovato preventivamente un basso valore di biodegradabilità), è necessaria un'altra serie di bottiglie.

Preparare un'altra bottiglia grande, che deve contenere mezzo minerale aerato (fino a circa un terzo del suo volume) più la sostanza chimica in esame e la sostanza chimica di riferimento alle concentrazioni finali normalmente uguali a quelle usate nelle altre bottiglie grandi.

Inoculare le soluzioni contenute nelle bottiglie grandi con effluente secondario (da una goccia, o circa 0,05 ml, a 5 ml/l) o con un'altra fonte, come acqua di fiume (vedi I 6.4.2). Infine, portare a volume le soluzioni con mezzo minerale aerato utilizzando un tubo flessibile che arrivi fino al fondo della bottiglia per realizzare una adeguata miscelazione.

VI 2.5 Numero di contenitori usati in un saggio tipo

In una prova tipica si usano le seguenti bottiglie:

almeno 10 contenenti la sostanza chimica in esame e l'inoculo (sospensione in esame),

almeno 10 contenenti solo l'inoculo (bianco dell'inoculo),

almeno 10 contenenti la sostanza chimica di riferimento e l'inoculo (controllo),

e, quando sia necessario, 6 bottiglie contenenti la sostanza chimica in esame, la sostanza chimica di riferimento e l'inoculo (controllo di tossicità). Tuttavia, per poter essere sicuri di riuscire a identificare la fase di crescita (time window) di 10 giorni, sarà necessario un numero di bottiglie circa doppio.

VI.2.6. Esecuzione del saggio

Dosare immediatamente ciascuna soluzione preparata nel rispettivo gruppo di bottiglie per BOD mediante un tubo flessibile prelevandola dal quarto inferiore (non dal fondo) dell'opportuna bottiglia grande in modo che tutte le bottiglie per BOD siano completamente riempite. Battere delicatamente per rimuovere eventuali bolle d'aria. Analizzare immediatamente le bottiglie al tempo zero per determinare l'ossigeno disciolto mediante il metodo di Winkler o il metodo all'elettrodo. Il contenuto delle bottiglie può venire conservato per un'analisi successiva mediante il metodo di Winkler aggiungendo solfato di manganese (II) e idrossido di sodio (il primo reagente di Winkler). Conservare le bottiglie, accuratamente tappate, contenenti l'ossigeno fissato in forma di ossido di manganese (III) idrato marrone, al buio a 10-20 °C per non oltre 24 ore prima di procedere con le fasi rimanenti del metodo di Winkler. Tappare le bottiglie in multiplo rimanenti assicurandosi che non siano intrappolate bolle d'aria, e incubare a 20 °C al buio. Ciascuna serie deve essere accompagnata da una serie parallela completa per la determinazione del bianco del mezzo inoculato. Prelevare bottiglie almeno in doppio di tutte le serie per l'analisi dell'ossigeno disciolto ad intervalli di tempo (almeno settimanali) durante i 28 giorni di incubazione.

I campioni settimanali dovrebbero permettere la valutazione della rimozione percentuale in una fase di crescita di 14 giorni, mentre un campionamento ogni 3-4 giorni dovrebbe permettere di identificare la fase di crescita di 10 giorni, il che richiederà un numero di bottiglie circa doppio.

Per sostanze in esame contenenti azoto, si devono apportare delle correzioni per il consumo dell'ossigeno che si verifica nell'eventuale nitrificazione. A questo scopo, usare il metodo dell'elettrodo a O_2 per la determinazione della concentrazione di ossigeno disciolto e prelevare poi un campione dalla bottiglia per BOD per analizzare nitrati e nitriti. Dall'aumento di concentrazione dei nitriti e dei nitrati, calcolare l'ossigeno consumato (vedi allegato V).

VI.3. DATI E RELAZIONE

VI.3.1. Modalità di esposizione dei risultati

Calcolare per prima cosa il BOD dopo ciascun periodo di tempo sottraendo il consumo di ossigeno ($mg O_2/l$) del bianco dell'inoculo da quello presentato dalla sostanza chimica in esame. Dividere questo consumo corretto per la concentrazione (mg/l) della sostanza chimica in esame per ottenere il BOD specifico come mg di ossigeno per mg di sostanza chimica in esame. Calcolare la biodegradabilità percentuale dividendo il BOD specifico per il ThOD specifico (calcolato secondo l'allegato II.2) o per il COD (determinato mediante analisi, vedi allegato II.3), come segue:

$$BOD = \frac{mg O_2 \text{ consumato dalla sostanza chimica in esame} - mg O_2 \text{ consumato dal bianco}}{mg \text{ sostanza chimica in esame nel contenitore}}$$

$$- mg O_2 \text{ per } mg \text{ di sostanza chimica in esame}$$

$$\% \text{ degradazione} = \frac{BOD (mg O_2/mg \text{ sostanza chimica})}{ThOD (mg O_2/mg \text{ sostanza chimica})} \times 100$$

$$\% \text{ degradazione} = \frac{BOD (mg O_2/mg \text{ sostanza chimica})}{COD (mg O_2/mg \text{ sostanza chimica})} \times 100$$

Si noti che questi due metodi non forniscono necessariamente lo stesso valore; è preferibile usare il primo dei due.

Per le sostanze in esame che contengono azoto, utilizzare il valore appropriato di ThOD (NH_4 o NO_3) secondo quanto è noto o ci si aspetta per quanto riguarda il verificarsi della nitrificazione (allegato II.2). Se si verifica la nitrificazione ma non è completa, calcolare una correzione per tener conto dell'ossigeno consumato dalla nitrificazione in base alle variazioni di concentrazione dei nitriti e dei nitrati (allegato V).

VI.3.2. Validità dei risultati

Il consumo di ossigeno nel bianco dell'inoculo non dovrebbe superare 1,5 mg di ossigeno disciolto/l dopo 28 giorni. Valori più elevati di questo richiedono un esame delle tecniche sperimentali. La concentrazione residua

di ossigeno nelle bottiglie di prova non dovrebbe scendere al di sotto di 0,5 mg/l dopo questo tempo. Livelli di ossigeno così bassi sono validi solo se il metodo usato per la determinazione dell'ossigeno disciolto è in grado di misurare accuratamente livelli così bassi.

Vedi anche I.5.2.

VI.3.3. Relazione

Vedi I.8.

VI.4. MODULARIO

Nel seguito è presentato un esempio di modulo predisposto.

SAGGIO DELLA BOTTIGLIA CHIUSA

Recipiente 1: (m ₁₀ - m _{1x}) - (m _{b0} - m _{bx})				
Recipiente 2: (m ₁₀ - m _{1x}) - (m _{b0} - m _{bx})				
Recipiente 1: $\% D_1 = \frac{[(m_{10} - m_{1x}) - (m_{b0} - m_{bx})] \times 100}{\text{conc. sost. in esame} \times \text{ThOD sost.}}$				
Recipiente 2: $\% D_2 = \frac{[(m_{10} - m_{1x}) - (m_{b0} - m_{bx})] \times 100}{\text{conc. sost. in esame} \times \text{ThOD sost.}}$				
$\% D \text{ media } = \frac{D_1 + D_2}{2}$				

(*) Non prendere il valore medio se c'è una notevole differenza tra due dati replicati

m₁₀ = valore nel recipiente di saggio al tempo 0m_{1x} = valore nel recipiente di saggio al tempo xm_{b0} = valore medio del bianco al tempo 0m_{bx} = valore medio del bianco al tempo x

Applicare anche la correzione per la nitrificazione da iii + vi della sezione 6.

8. CONSUMI DI DO DEL BIANCO

Consumo di ossigeno da parte del bianco: (m₁₀ - m_{b2x}) mg/l. Questo consumo è importante per la validità del saggio. Non deve essere inferiore a 1,5 mg/l.

PARTE VII. SAGGIO MITI (Metodo C.4-F)**VII.1. PRINCIPIO DEL METODO**

Il consumo di ossigeno da parte di una soluzione o sospensione agitata della sostanza chimica in esame in un mezzo minerale inoculato con microrganismi non adattati, coltivati in modo speciale, viene misurato in modo automatico in un arco di tempo di 28 giorni in un respirometro tenuto in ambiente chiuso al buio a $25 \pm 1^\circ\text{C}$. Il biossido di carbonio sviluppato viene assorbito mediante calce sodata. La biodegradabilità è espressa come percentuale di ossigeno consumato (corretta del consumo del bianco) rispetto all'assorbimento teorico (ThOD). La percentuale di biodegradabilità primaria viene inoltre calcolata mediante una analisi chimica specifica supplementare effettuata all'inizio e al termine dell'incubazione e, possibilmente, mediante analisi del DOC.

VII.2. DESCRIZIONE DEL METODO**VII.2.1. Apparecchiatura**

- Misuratore elettrolitico automatico di BOD o respirometro equipaggiato normalmente con 6 bottiglie da 300 ml ciascuna munite di contenitori per l'assorbimento del CO_2 ;
- camera e/o bagno d'acqua a temperatura costante a $25^\circ\text{C} \pm 1^\circ\text{C}$ o meglio;
- dispositivo di filtrazione su membrana (facoltativo);
- analizzatore di carbonio (facoltativo).

VII.2.2. Preparazione del mezzo minerale

Preparare le seguenti soluzioni concentrate (stock) utilizzando reattivi puri per analisi e acqua (I.6.1.)

- | | | |
|-----|---|---------|
| (a) | Diidrogenoortofosfato monopotassico, KH_2PO_4 | 8,50 g |
| | Monoidrogenoortofosfato dipotassico, K_2HPO_4 | 21,75 g |
| | Monoidrogenoortofosfato disodico dodecaidrato $\text{Na}_2\text{HPO}_4 \cdot 12 \text{H}_2\text{O}$ | 44,60 g |
| | Cloruro d'ammonio, NH_4Cl | 1,70 g |
| | Sciogliere in acqua e portare a 1 litro | |
| | Il pH della soluzione deve essere 7,2 | |
| (b) | Solfato di magnesio eptaidrato, $\text{MgSO}_4 \cdot 7 \text{H}_2\text{O}$ | 22,50 g |
| | Sciogliere in acqua e portare a 1 litro | |
| (c) | Cloruro di calcio anidro, CaCl_2 | 27,50 g |
| | Sciogliere in acqua e portare a 1 litro | |
| (d) | Cloruro di ferro (III) esaidrato, $\text{FeCl}_3 \cdot 6 \text{H}_2\text{O}$ | 0,25 g |
| | Sciogliere in acqua e portare a 1 litro. | |

Prelevare 3 ml di ciascuna soluzione (a), (b), (c) e (d) e portare a 1 litro.

VII.2.3. Preparazione dell'inoculo

Raccogliere campioni freschi provenienti da almeno 10 località, principalmente da aree nelle quali vengono usati e scaricati vari prodotti chimici. Raccogliere da località come impianti di trattamento degli scarichi di fognatura, trattamento delle acque di scarico industriali, fiumi, laghi, mari, campioni da 1 litro di fango, terreno superficiale, acqua e così via e miscelare accuratamente insieme. Dopo avere rimosso la sostanza galleggiante e aver lasciato il resto a riposo, regolare il surnatante a $\text{pH } 7 \pm 1$ con idrossido di sodio o acido fosforico.

Utilizzare un volume appropriato del surnatante filtrato per riempire un recipiente a fango attivo del tipo riempi e preleva e aerare il liquido per circa 23 ore e mezzo. Trenta minuti dopo avere arrestato l'aerazione, scartare circa un terzo del volume totale di surnatante e aggiungere un volume uguale di una soluzione (pH = 7) contenente lo 0,1 % rispettivamente di glucosio, peptone e ortofosfato monopotassico al materiale decantato e ricominciare l'aerazione. Ripetere questa procedura una volta al giorno. L'unità del fango deve essere fatta funzionare secondo la buona pratica di laboratorio: gli effluenti dovrebbero essere limpidi, la temperatura dovrebbe mantenersi a $25 \pm 2^\circ\text{C}$, il pH dovrebbe essere 7 ± 1 , il fango ben decantato, una sufficiente aerazione per mantenere la miscela aerobica per tutto il tempo, devono essere presenti protozoi e l'attività del fango deve essere verificata contro una sostanza di riferimento almeno ogni tre mesi. Non usare il fango come inoculo prima di almeno un mese di funzionamento, ma nemmeno dopo più di quattro mesi. Prelevare, quindi, campioni da almeno 10 località ad intervalli regolari, una volta ogni tre mesi.

Allo scopo di mantenere il fango fresco e quello vecchio alla stessa attività, miscelare il surnatante filtrato di un fango attivo in uso con un volume uguale del surnatante filtrato di una miscela raccolta di fresco da 10 fonti e coltivare il liquido combinato come visto sopra. Prelevare il fango da usarsi come inoculo 18-24 ore dopo che l'unità è stata alimentata.

VII.2.4. Preparazione dei contenitori

Preparare i seguenti sei palloni:

- n. 1: sostanza chimica in esame in acqua di diluizione a 100 mg/l
- n. 2, 3 e 4: sostanza chimica in esame nel mezzo minerale a 100 mg/l
- n. 5: sostanza chimica di riferimento (per esempio anilina) nel mezzo minerale a 100 mg/l
- n. 6: mezzo minerale da solo

Aggiungere le sostanze chimiche scarsamente solubili direttamente, in ragione del peso o del volume, o trattarle come descritto nell'allegato III, salvo il fatto che non si devono usare né solventi né agenti emulsionanti. Aggiungere l'assorbente del CO_2 in tutti i contenitori in speciali recipienti appositamente previsti. Regolare il pH nei contenitori n. 2, 3 e 4 a 7,0.

VII.2.5. Esecuzione del saggio

Inoculare i palloni n. 2, 3 e 4 (sospensioni in esame), n. 5 (controllo dell'attività) e n. 6 (bianco dell'inoculo) con un piccolo volume dell'inoculo fino ad una concentrazione di 30 mg/l di solidi sospesi. Non si aggiunge inoculo nel contenitore n. 1, che serve da controllo abiotico. Montare l'apparecchiatura, controllare che sia a tenuta d'aria, avviare gli agitatori e iniziare la misura dell'assorbimento di ossigeno in condizioni di buio. Controllare giornalmente la temperatura, l'agitatore e il registratore del consumo di ossigeno coulometrico e annotare tutte le eventuali variazioni di colore del contenuto dei contenitori. Leggere il consumo di ossigeno per i sei palloni mediante un idoneo metodo, per esempio direttamente dal registratore scrivente a sei punti, che produce una curva di BOD. Al termine dell'incubazione, normalmente 28 giorni, misurare il pH del contenuto nei contenitori e determinare la concentrazione della sostanza chimica in esame residua e di tutti gli eventuali intermedi e, nel caso di sostanze solubili in acqua, la concentrazione di DOC (allegato II.4). Porre una cura particolare nel caso di sostanze chimiche volatili. Se si prevede la nitrificazione, determinare, se possibile, la concentrazione di nitrati e nitriti.

VII.3. DATI E RELAZIONE

VII.3.1. Modalità di esposizione dei risultati

Dividere il consumo di ossigeno (mg) da parte della sostanza chimica in esame dopo un tempo stabilito (corretto del controllo del bianco di inoculo dopo lo stesso tempo) per il peso della sostanza chimica in esame usata. Questo fornisce il BOD espresso come mg di ossigeno / mg di sostanza chimica in esame, cioè

$$\begin{aligned} \text{BOD} &= \frac{\text{mg O}_2 \text{ consumato dalla sostanza chimica in esame} - \text{mg O}_2 \text{ consumato dal bianco}}{\text{mg sostanza chimica in esame nel contenitore}} \\ &= \text{mg O}_2 \text{ per mg di sostanza chimica in esame} \end{aligned}$$

La biodegradazione percentuale si ottiene poi da

$$\text{degrad biologica} = \% \text{ ThOD} = \frac{\text{BOD (mg O}_2\text{/mg sostanza chimica)}}{\text{ThOD (mg O}_2\text{/mg sostanza chimica)}} \times 100$$

Per le miscele, calcolare il ThOD dall'analisi elementare, come per i composti semplici. Utilizzare il valore appropriato di ThOD (ThOD_{NH4} o ThOD_{NO3}) a seconda che la nitrificazione sia assente o completa (allegato II.2). Se, tuttavia, si verifica la nitrificazione ma non è completa, calcolare la correzione, che tenga conto dell'ossigeno consumato per nitrificazione, dalle variazioni di concentrazione di nitriti e nitrati (allegato V).

Calcolare la biodegradazione primaria percentuale dalla perdita del composto chimico (progenitore) specifico (vedi I.7.2.).

$$D_t = \frac{S_b - S_a}{S_b} \times 100 \%$$

Se c'è stata una perdita di sostanza chimica in esame nel contenitore n. 1 che misura la rimozione chimico-fisica, riportare questa nella relazione e usare la concentrazione della sostanza chimica in esame (S_b) dopo 28 giorni in questo pallone per calcolare la biodegradazione percentuale.

Quando si effettuano misure (facoltative) di DOC, calcolare la biodegradazione finale percentuale da:

$$D_t = \left(1 - \frac{C_t - C_{bt}}{C_o - C_{bo}} \right) \times 100$$

come descritto al punto I.7.1. Se c'è stata una perdita di DOC nel pallone n. 1, che misura la rimozione chimico-fisica, utilizzare la concentrazione di DOC in questo pallone per calcolare la biodegradazione percentuale.

Registrare tutti i risultati sui moduli allegati.

VII.3.2 Validità dei risultati

Il consumo di ossigeno da parte del bianco dell'inoculo è normalmente di 20-30 mg O₂/l e non dovrebbe essere maggiore di 60 mg/l in 28 giorni. Valori più elevati di 60 mg/l richiedono un esame critico dei dati e delle tecniche sperimentali. Se il valore del pH è al di fuori del campo 6-8,5 e il consumo di ossigeno da parte della sostanza chimica in esame è minore del 60 %, si dovrebbe ripetere la prova con una minore concentrazione della sostanza chimica in esame.

Vedi anche I.5.2

Se la degradazione percentuale dell'anilina, calcolata dal consumo di ossigeno, non supera il 40 % dopo 7 giorni e il 65 % dopo 14 giorni, la prova viene considerata non valida.

VII.3.3 Relazione

Calcolare la degradazione % per i contenitori a1, a2 e a3 rispettivamente.

8 NOTE

Se disponibile, allegare la curva del BOD in funzione del tempo.

ALLEGATO I

ABBREVIAZIONI E DEFINIZIONI

- DO:** Ossigeno disciolto (mg/l); è la concentrazione di ossigeno disciolto in un campione acquoso.
- BOD:** Domanda biochimica di ossigeno (g); è la quantità di ossigeno consumato dai microorganismi nella metabolizzazione di un composto in esame; espressa anche come grammi di ossigeno consumato per grammo di composto in esame (vedi metodo C.5).
- COD:** Domanda chimica di ossigeno (g); è la quantità di ossigeno consumata durante l'ossidazione di un composto in esame con dicromato acido caldo: fornisce una misura della quantità di materia ossidabile presente; espressa anche come grammi di ossigeno consumati per grammo di sostanza in esame (vedi metodo C.6).
- DOC:** Carbonio organico disciolto; è il carbonio organico presente in soluzione o che passa attraverso un filtro da 0,45 micrometri o che rimane nel surnatante dopo centrifugazione a $40\,000\text{ m/s}^2$ ($\pm 4\,000\text{ g}$) per 15 minuti.
- ThOD:** Domanda teorica di ossigeno (mg); è la quantità totale di ossigeno richiesta per ossidare completamente una sostanza chimica; viene calcolata dalla formula molecolare (vedi allegato II.2) ed è espressa anche come mg di ossigeno richiesti per mg di sostanza in esame.
- ThCO₂:** Biossido di carbonio teorico (mg); è la quantità di biossido di carbonio prodotto calcolato dal contenuto di carbonio noto o misurato della sostanza in esame quando sia stata completamente mineralizzata; espresso anche come mg di biossido di carbonio sviluppati per mg di sostanza in esame.
- TOC:** Carbonio organico totale di un campione; è la somma del carbonio organico in soluzione e in sospensione.
- IC:** Carbonio inorganico.
- TC:** Carbonio totale; è la somma del carbonio organico e di quello inorganico presenti in un campione.

Biodegradazione primaria:

è l'alterazione della struttura chimica di una sostanza provocata da un'azione biologica, che dà come risultato la perdita delle proprietà specifiche di quella sostanza.

Biodegradazione ultima (aerobica):

è il livello di degradazione realizzato quando la sostanza in esame è completamente utilizzata da microorganismi, con il risultato della produzione di biossido di carbonio, acqua, sali minerali e nuovi costituenti cellulari microbici (biomassa).

Prontamente biodegradabile:

una classificazione arbitraria di sostanze chimiche che hanno superato certe prove specifiche di selezione riguardo alla biodegradabilità ultima; queste prove sono così rigorose che si suppone che tali composti si degraderanno biologicamente in modo rapido e completo in ambienti acquosi in condizioni aerobiche.

Intrinsecamente biodegradabile:

una classificazione di sostanze chimiche per le quali vi è una dimostrazione inequivocabile di biodegradazione (primaria o ultima) in qualsiasi riconosciuto saggio di biodegradabilità.

Trattabilità:

è la capacità di composti di essere rimossi durante il trattamento biologico di acque di scarico senza influire in modo dannoso sul funzionamento normale dei processi di trattamento. In generale, i composti prontamente biodegradabili possono essere trattati, ma non tutti i composti intrinsecamente biodegradabili lo sono. Possono funzionare anche processi abiotici.

Tempo di latenza

è il tempo che passa dall'inoculazione in un saggio di rimozione lenta a quando la degradazione percentuale è aumentata fino ad almeno il 10 %. Il tempo di latenza è spesso notevolmente variabile e scarsamente riproducibile.

Tempo di degradazione

è il tempo che passa dal termine del tempo di latenza al momento in cui si raggiunge il 90 % o il massimo livello di degradazione.

Finestra di 10 giorni:

sono i 10 giorni che seguono immediatamente il raggiungimento del 10 % di degradazione.

ALLEGATO II

CALCOLO E DETERMINAZIONE DEI PARAMETRI SIGNIFICATIVI

Secondo il metodo scelto, saranno richiesti certi parametri somma. La sezione che segue descrive come ricavare questi valori. L'uso di questi parametri è descritto nei metodi specifici.

1. Contenuto di carbonio

Il contenuto di carbonio viene calcolato dalla composizione elementare nota oppure viene determinato mediante analisi elementare della sostanza in esame.

2. Domanda teorica di ossigeno (ThOD)

La domanda teorica di ossigeno (ThOD) può essere calcolata se è nota la composizione elementare, oppure se questa viene determinata mediante analisi elementare. Per il composto:

senza nitrificazione, si ha

$$ThOD_{NH4} = \frac{16 (2c + 1/2 (h - cl - 3n) + 3s + 5/2 p + 1/2 na - o)}{PM} \text{ mg/mg}$$

oppure, con nitrificazione,

$$ThOD_{NO3} = \frac{16 (2c + 1/2 (h - cl) + 5/2 n + 3s + 5/2 p + 1/2 na - o)}{PM} \text{ mg/mg}$$

3. Domanda chimica di ossigeno (COD)

La domanda chimica di ossigeno (COD) viene determinata secondo il metodo C.6.

4. Carbonio organico disciolto (DOC)

Il carbonio organico disciolto (DOC) è per definizione il carbonio organico di qualsiasi sostanza chimica o miscela in acqua che passa attraverso un filtro da 0,45 micrometri.

Campioni estratti dal recipiente di prova vengono prelevati e filtrati immediatamente nell'apparecchiatura di filtrazione utilizzando un appropriato filtro a membrana. I primi 20 ml (quantità che può essere ridotta quando si usino filtri piccoli) del filtrato vengono scartati. Per l'analisi del carbonio si trattengono volumi di 10-20 ml, o minori, nel caso vengano iniettati (il volume dipende dalla quantità richiesta dall'analizzatore del carbonio). La concentrazione di DOC viene determinata mediante un analizzatore di carbonio organico che è in grado di misurare accuratamente una concentrazione di carbonio equivalente o minore del 10 % della concentrazione iniziale di DOC usata nella prova.

Campioni filtrati che non possono essere analizzati lo stesso giorno di lavoro possono essere conservati in frigorifero a 2-4 °C per 48 ore o al di sotto di -18 °C per periodi più lunghi.

Note:

I filtri a membrana sono spesso impregnati di tensioattivi per la idrofilizzazione. Così i filtri possono contenere fino a parecchi mg di carbonio organico solubile che interferirebbe nelle determinazioni di biodegradabilità. I tensioattivi e altri composti organici solubili vengono rimossi dai filtri bollendoli in acqua deionizzata per tre volte di 1 ora ciascuno. I filtri possono poi venire conservati in acqua per una settimana. Se si utilizzano cartucce filtranti a perdere, ciascuna partita deve essere controllata per confermare che non liberi carbonio organico solubile.

Secondo il tipo di filtro a membrana, la sostanza chimica in esame può essere trattenuta per adsorbimento. Pertanto può essere consigliabile assicurarsi che la sostanza chimica in esame non venga trattenuta dal filtro.

Una centrifugazione $\sim 40\,000\text{ m/s}^2$ (4 000 g) per 15 minuti può venire usata al posto della filtrazione per differenziare tra TOC e DOC. Il metodo non è affidabile a una concentrazione iniziale $< 10\text{ mg DOC/l}$ perché o non vengono rimossi tutti i batteri, oppure viene ridisciolto carbonio come parte del plasma batterico.

ALLEGATO III

VALUTAZIONE DELLA BIODEGRADABILITÀ DI SOSTANZE SCARSAMENTE SOLUBILI

Nei saggi di biodegradabilità con sostanze scarsamente solubili, si dovrebbe prestare una particolare attenzione agli aspetti seguenti:

Mentre i liquidi omogenei raramente creano problemi di campionamento, si raccomanda di omogeneizzare i materiali solidi mediante mezzi appropriati per evitare errori dovuti alla disomogeneità. Un'attenzione particolare deve essere adoperata quando occorrono campioni rappresentativi di pochi mg prelevati da miscele di prodotti chimici o sostanze con grandi quantità di impurezze.

Durante le prove si possono usare varie forme di agitazione. Bisogna porre attenzione ad applicare semplicemente una agitazione sufficiente per mantenere in dispersione la sostanza chimica e di evitare un surriscaldamento, eccessiva formazione di schiuma e eccessive forze di taglio.

Si può usare un emulsionante che fornisca una dispersione stabile della sostanza chimica. Esso non dovrebbe essere tossico per i batteri e non dovrebbe essere biodegradato né provocare schiuma nelle condizioni sperimentali.

Gli stessi criteri valgono per i solventi e gli emulsionanti

Non è raccomandabile usare carriers solidi per le sostanze in esame solide, ma essi possono essere adatti per le sostanze oleose

Quando si utilizzano sostanze ausiliarie, come emulsionanti, solventi e veicoli, si dovrebbe eseguire una prova in bianco contenente la sostanza ausiliaria

Per studiare la biodegradabilità di composti scarsamente solubili si può usare uno qualunque dei tre saggi respirometrici CO_2 , BOD, MITI

ALLEGATO IV

VALUTAZIONE DELLA BIODEGRADABILITÀ DI SOSTANZE CHIMICHE DI SOSPETTA TOSSICITÀ PER L'INOCULO

Quando una sostanza chimica viene sottoposta ad un saggio di pronta biodegradabilità e risulta non biodegradabile, si raccomanda di eseguire la procedura seguente se si vuole distinguere tra inibizione e inerti (Reynolds et al., 1987)

Si devono usare inoculi simili o identici per i saggi di tossicità e degradazione biologica

Per valutare la tossicità di sostanze chimiche studiate in saggi di pronta biodegradabilità, sembra appropriata l'applicazione di uno dei metodi, o una loro combinazione, di inibizione del tasso di respirazione del fango (saggio di inibizione della respirazione del fango attivo — Direttiva 88/302/CEE), BOD e/o inibizione della crescita

Se si deve evitare l'inibizione dovuta a tossicità, si suggerisce di usare nelle prove di pronta biodegradabilità una concentrazione della sostanza in esame minore di 1/10 dei valori di EC_{50} (o minore dei valori di EC_{10}) ottenuti nelle prove di tossicità. I composti con un valore di EC_{50} maggiore di 300 mg/l è improbabile che abbiano effetti tossici nelle prove di pronta biodegradabilità

I valori di EC_{50} minori di 20 mg/l è probabile che pongano seri problemi per la successiva esecuzione delle prove. Si devono impiegare concentrazioni di prova basse, che richiedono l'uso del saggio rigoroso e sensibile della bottiglia chiusa oppure l'uso di materiale marcato ^{14}C . In alternativa, un inoculo acclimatato può permettere di usare concentrazioni più elevate della sostanza in esame. In questo ultimo caso, tuttavia, si perde lo specifico criterio di pronta biodegradabilità

ALLEGATO V

CORREZIONE DELL'ASSORBIMENTO DI OSSIGENO PER INTERFERENZA DOVUTA A NITRIFICAZIONE

Errori dovuti al fatto di non considerare la nitrificazione, nella valutazione del consumo di ossigeno nella biodegradabilità di sostanze in esame che non contengono azoto, sono marginali (minori del 5 %), anche se si verifica, in modo irregolare, l'ossidazione dell'azoto ammoniacale nel mezzo, tra i recipienti di prova e i recipienti del bianco. Invece, per le sostanze di prova, che contengono azoto, possono verificarsi gravi errori

Se si è avuta nitrificazione ma questa non è completa, il consumo di ossigeno osservato, nella miscela di reazione, può essere corretto tenendo conto della quantità di ossigeno utilizzata nell'ossidazione dell'ammonio a nitrito e nitrato, se si determinano le variazioni di concentrazione dei nitriti e dei nitrati durante l'incubazione, tenendo conto delle equazioni seguenti

Complessivamente

Dall'equazione (1) risulta che l'ossigeno consumato da 28 g d'azoto, contenuti nel cloruro d'ammonio (NH_4Cl) ossidato a nitrito è pari a 96 g, il che corrisponde ad un fattore di 3,43 (96/28). Nello stesso modo dall'equazione (3) l'assorbimento di ossigeno da parte di 28 g di azoto, ossidati a nitrato, è di 128 g, il che corrisponde ad un fattore di 4,57 (128/28).

Poichè le reazioni avvengono *in sequenza*, in quanto sono eseguite da specie batteriche distinte e differenti, è possibile che la concentrazione di nitrito aumenti o diminuisca, in quest'ultimo caso si formerà una concentrazione equivalente di nitrato. Così, l'ossigeno consumato nella formazione di nitrato è 4,57 moltiplicato per l'aumento di concentrazione del nitrato, mentre l'ossigeno associato alla formazione di nitrito è 3,43 moltiplicato per l'aumento di concentrazione del nitrito o per la diminuzione della sua concentrazione, la perdita di ossigeno è - 3,43 moltiplicato per la diminuzione di concentrazione.

Cioè

$$\text{O}_2 \text{ consumato nella formazione di nitrato} = 4,57 \times \text{aumento di concentrazione dei N-nitrati} \quad (4)$$

e

$$\text{O}_2 \text{ consumato nella formazione di nitrito} = 3,43 \times \text{aumento della concentrazione di N-nitrito} \quad (5)$$

e

$$\text{O}_2 \text{ perso nella sparizione dei nitriti} = - 3,43 \times \text{diminuzione della concentrazione di N-nitriti} \quad (6)$$

$$\text{Di modo che l'assorbimento di O}_2 \text{ dovuto alla nitrificazione} = \pm 3,43 \times \text{variazione della concentrazione di N-nitrito} + 4,57 \times \text{aumento della concentrazione di N-nitrato} \quad (7)$$

$$\text{e così l'assorbimento di O}_2 \text{ dovuto all'ossidazione del C} = \text{assorbimento osservato totale} - \text{assorbimento dovuto alla nitrificazione} \quad (8)$$

In alternativa, se si determina solo l'N totale ossidato, l'assorbimento di ossigeno dovuto alla nitrificazione può essere assunto, in prima approssimazione, pari a $4,57 \times \text{aumento di N ossidato}$.

Il valore corretto per il consumo di ossigeno dovuto all'ossidazione di C viene poi confrontato con il $\text{ThOD}_{\text{NH}_4}$, come calcolato nell'allegato II.

C.5. DEGRADAZIONE — DOMANDA BIOCHIMICA DI OSSIGENO (BOD)

1 METODO

1.1 INTRODUZIONE

Il presente metodo serve a misurare la domanda biochimica di ossigeno (BOD) delle sostanze organiche solide e liquide.

I dati ottenuti con questa prova riguardano i composti idrosolubili; è tuttavia possibile, almeno in linea di principio, esaminare anche i composti volatili e quelli poco solubili in acqua.

Il metodo può essere applicato soltanto a sostanze organiche che non esercitano azione inibitoria sui batteri alla concentrazione impiegata per le prove. Se la sostanza non è solubile, per ottenere una buona dispersione potrà essere necessario ricorrere a speciali accorgimenti, come l'impiego di ultrasuoni.

Informazioni preliminari in merito alla tossicità del composto chimico possono risultare utili per interpretare i valori più bassi e per scegliere adeguate concentrazioni per la prova.

1.2 DEFINIZIONI ED UNITÀ

Si definisce BOD la quantità di ossigeno che un determinato quantitativo della sostanza in esame richiede, in determinate condizioni, per consentire il verificarsi del processo di ossidazione biochimica.

I risultati vengono espressi in g di BOD per g di sostanza esaminata.

1.3 SOSTANZE DI RIFERIMENTO

È consigliabile impiegare una sostanza di riferimento adatta per verificare l'attività dell'inoculo.

1.4 PRINCIPIO DEL METODO

Una quantità predeterminata della sostanza in esame, disciolta o dispersa in un mezzo idoneo ben aerato, viene inoculata con opportuni microorganismi e posta in incubazione al buio, a temperatura ambiente determinata e costante.

Il BOD viene determinato dalla differenza del contenuto di ossigeno disciolto all'inizio e alla fine del saggio. La durata del saggio deve essere almeno di 5 giorni e non più di 28 giorni.

Deve essere effettuata in parallelo una prova in bianco, su un sistema analogo, ma non contenente la sostanza in esame.

1.5 CRITERI DI QUALITÀ

La determinazione del BOD non può essere ritenuta una valida determinazione della biodegradabilità di una sostanza. Il presente metodo può essere considerato unicamente come un saggio orientativo.

1.6 DESCRIZIONE DEL METODO

Si prepara preliminarmente una soluzione od una dispersione della sostanza da esaminare, per ottenere una concentrazione di BOD compatibile con il metodo impiegato. Si determina successivamente il BOD seguendo un qualunque metodo nazionale o internazionale normalizzato.

2 DATI E VALUTAZIONE

Il BOD ottenuto nella soluzione preliminare viene calcolato conformemente al metodo normalizzato prescelto e convertito in grammi di BOD per grammo di sostanza esaminata

3 RELAZIONE

Va precisato il metodo impiegato

La domanda biochimica di ossigeno deve risultare dalla media di almeno tre misurazioni valide

Va indicata ogni informazione ed ogni osservazione utile per l'interpretazione del saggio, soprattutto per quanto riguarda le impurezze, lo stato fisico, gli effetti tossici, la composizione intrinseca della sostanza ed ogni altro elemento tale da influenzarne i risultati

Nella relazione va indicato l'eventuale impiego di un additivo mirante a impedire la nitrificazione biologica

C.6 DEGRADAZIONE — DOMANDA CHIMICA DI OSSIGENO (COD)**1 METODO****1.1 INTRODUZIONE**

Il presente metodo è destinato alla determinazione della domanda chimica di ossigeno (COD) delle sostanze organiche solide o liquide, secondo una tecnica normalizzata ed arbitraria, in condizioni di laboratorio prefissate

Per effettuare la prova ed interpretarne i risultati sarà utile disporre di dati sulla formula chimica della sostanza (ad esempio sali idrogeniti, sali ferrosi di composti organici, composti organoclorurati)

1.2 DEFINIZIONI ED UNITÀ

La richiesta chimica di ossigeno è una misura dell'ossidabilità di una sostanza, espressa come equivalente in ossigeno di un reattivo ossidante consumato dalla sostanza in condizioni di laboratorio prestabilite

Il risultato si esprime in g COD/g sostanza in esame

1.3 SOSTANZE DI RIFERIMENTO

Nell'esame di nuovi prodotti non è necessario impiegare costantemente sostanze di riferimento. Queste dovrebbero servire essenzialmente a calibrare saltuariamente il metodo e fornire la possibilità di confrontare i risultati con quelli ottenuti applicando un altro metodo.

1.4 PRINCIPIO DEL METODO

Una quantità prestabilita della sostanza da esaminare, disciolta o dispersa in acqua, viene ossidata con potassio dicromato in ambiente fortemente acido per H_2SO_4 , impiegando solfato d'argento come catalizzatore e facendo bollire a ricadere per due ore. La quantità residua di dicromato viene determinata titolando con solfato di ferro (II) e ammonio standardizzato.

Nel caso delle sostanze contenenti cloro, si aggiunge solfato di mercurio (*) per ridurre l'interferenza dei cloruri.

1.5 CRITERI DI QUALITÀ

Dati l'arbitrarietà di determinazione del metodo, il COD è un «indicatore di ossidabilità» e come tale viene usato come un metodo pratico per determinare le sostanze organiche.

Nelle prove possono interferire i cloruri; anche riducenti o ossidanti inorganici possono interferire con la determinazione del COD.

Alcuni composti ciclici e molte sostanze volatili (per esempio acidi grassi inferiori) non vengono ossidati completamente da questo saggio.

1.6 DESCRIZIONE DEL METODO

Nel caso delle sostanze contenenti cloro, si aggiunge solfato di mercurio (Dopo l'uso, le soluzioni contenenti sali di mercurio devono essere trattate in modo da evitare la diffusione di mercurio nell'ambiente) per ridurre l'interferenza dei cloruri.

Si prepara una soluzione o una dispersione della sostanza da saggiare, in modo da ottenere una domanda chimica di ossigeno compresa tra 250 e 600 mg/l di COD.

Osservazioni

Nel caso di sostanze scarsamente solubili o non disperdibili, si può pesare una quantità di sostanza, finemente polverizzata od allo stato liquido, corrispondente a 5 mg di COD, e si colloca nell'apparecchio sperimentale con acqua.

La domanda chimica di ossigeno (COD) viene spesso determinata, specialmente nel caso di sostanze scarsamente solubili, secondo una variante al metodo, cioè in un sistema chiuso con un equalizzatore di pressione (H. Kelkenberg, 1975). Con questa variante, composti che si determinano solo con difficoltà con il metodo convenzionale — per esempio acido acetico — è spesso possibile riuscire a quantificarli. Anche questo metodo fallisce tuttavia nel caso della piridina. Se si aumenta la concentrazione del dicromato di potassio descritta nel riferimento (1), fino a 0,25 N (0,0416 M), la pesata diretta di 5-10 mg di sostanza viene facilitata, e ciò è essenziale per la determinazione del COD di sostanze scarsamente solubili in acqua (rif. 2).

Altrimenti, il COD viene poi determinato seguendo un qualunque metodo nazionale o internazionale normalizzato.

2 DATI E VALUTAZIONI

Il COD del recipiente sperimentale viene calcolato secondo il metodo normalizzato prescelto e trasformato in grammi di COD per grammi della sostanza in esame.

(*) Dopo l'uso, le soluzioni contenenti sali di mercurio devono essere trattate in modo da evitare la diffusione di mercurio nell'ambiente.

3. RELAZIONE

Nella relazione deve essere indicato il metodo di riferimento

Il COD deve risultare dalla media di almeno tre misure. Devono essere riferiti tutti i dati e le osservazioni significative per l'interpretazione dei valori ottenuti: ciò vale particolarmente per le impurezze, lo stato fisico e le proprietà della sostanza (se note), qualora possano influire sui risultati.

Va altresì riferito l'eventuale impiego di solfato mercurico per minimizzare l'interferenza dei cloruri.

C.7. DEGRADAZIONE — DEGRADAZIONE ABIOTICA: IDROLISI IN FUNZIONE DEL pH

1. METODO

Il metodo descritto si basa sulla linea guida dell'OCSE (1).

1.1 INTRODUZIONE

Tra le reazioni che influenzano la persistenza delle sostanze nell'ambiente, l'idrolisi è importante ai fini della degradazione abiotica e riveste quindi particolare interesse per le sostanze caratterizzate da bassa biodegradabilità.

La maggior parte delle reazioni di idrolisi è di *pseudo*-prim'ordine; i tempi di dimezzamento sono quindi indipendenti dalla concentrazione. Questo fatto consente di estrapolare i risultati ottenuti in laboratorio alle condizioni ambientali.

Sono stati inoltre riportati numerosi esempi (2) dai quali risulta un soddisfacente accordo tra i risultati ottenuti in acqua pura ed in acqua naturale per varie classi di composti chimici.

Ai fini dell'esecuzione del saggio, che è applicabile unicamente a sostanze solubili in acqua, è utile disporre di dati preliminari relativi alla tensione di vapore della sostanza in esame. Le impurezze possono influenzare i risultati.

È necessario esaminare il comportamento idrolitico ai valori di pH normalmente riscontrabili nell'ambiente (pH 4-9).

1.2 DEFINIZIONI ED UNITÀ DI MISURA

Per idrolisi si intende la reazione di un composto chimico RX con l'acqua, che può venir rappresentata dallo scambio del gruppo X con OH:

La velocità con cui la concentrazione di RX diminuisce è data da

$$\text{velocità} = k \cdot (\text{H}_2\text{O}) \cdot (\text{RX}) \quad (2)$$

Poiché l'acqua è presente in grande eccesso rispetto alla sostanza RX, la relazione (2) è normalmente descritta come «reazione di pseudo primo ordine», la relativa costante di velocità osservata è espressa dalla relazione

$$k_{\text{oss}} = k \cdot (\text{H}_2\text{O}) \quad (3)$$

Questa costante può essere ricavata, per un dato valore di pH e della temperatura, T, dall'espressione

$$k_{\text{oss}} = \frac{2,303}{t} \log \frac{C_0}{C_t} \quad (4)$$

dove

t = tempo,

C_0 = concentrazione di RX al tempo 0,

C_t = concentrazione di RX al tempo t,

2,303 = fattore di conversione tra logaritmi naturali e decimali.

Le concentrazioni sono espresse in g/l o mol/l.

La dimensione della costante k_{oss} è (tempo)⁻¹.

Il «tempo di dimezzamento», $t_{1/2}$, è definito come il tempo necessario affinché la concentrazione di RX sia ridotta del 50 %, cioè affinché

$$C_t = \frac{1}{2} C_0 \quad (5)$$

Dalle espressioni (4) e (5) deriva che

$$t_{1/2} = 0,693/k_{\text{oss}} \quad (5)$$

L'uso di solventi organici miscibili con l'acqua è raccomandato solamente nel caso di sostanze a bassa solubilità in acqua

La quantità del solvente dovrebbe essere minore dell'1 %, e tale da non interferire con il processo idrolitico

1.6.2 Apparecchiature

Si dovrebbero utilizzare recipienti di vetro muniti di tappo evitando comunque l'uso di grasso negli smerigli

Qualora il composto chimico o il sistema tampone siano volatili, ovvero qualora la sperimentazione sia effettuata a temperature elevate, saranno da preferirsi contenitori saldati o provvisti di chiusura a tenuta e sarà da evitare la presenza di spazio di testa

1.6.3 Metodo analitico

Il metodo deve essere specifico per permettere di determinare la sostanza in esame alle concentrazioni della soluzione su cui viene eseguito il saggio e può senz'altro essere costituito da una combinazione di tecniche analitiche adatte

Il metodo analitico usato dipenderà dalla natura della sostanza e deve essere sufficientemente preciso e sensibile da rivelare una riduzione pari al 10 % della concentrazione iniziale

1.6.4 Condizioni del saggio

Il saggio sarà eseguito utilizzando un ambiente termostato regolato alla temperatura prescelta per la reazione, $\pm 0,5^\circ\text{C}$. La temperatura dovrà essere mantenuta costante entro $\pm 0,1^\circ\text{C}$ e misurata con precisione pari a $\pm 0,1^\circ\text{C}$. Mediante misure adeguate, deve essere evitata l'interferenza fotolitica

Per le sostanze facilmente ossidabili, sarà necessario escludere la presenza di ossigeno disciolto (per esempio gorgogliando azoto o argon per 5 minuti prima di preparare la soluzione)

1.6.5 Procedimento

1.6.5.1 Saggio preliminare

Per tutte le sostanze si deve effettuare un saggio preliminare a $50^\circ\text{C} \pm 0,5^\circ\text{C}$ e ai tre valori di pH 4,0, 7,0 e 9,0. A tal fine un numero sufficiente di misure deve essere fatto in modo che si possa valutare se, a ciascun valore di pH e a 50°C , il tempo di dimezzamento ($t_{1/2}$) sia minore di 2,4 ore, oppure se la quantità di sostanza idrolizzata dopo 5 giorni sia meno del 10 %. Si può ritenere che questi valori corrispondano rispettivamente a tempi di dimezzamento minori di 1 giorno e maggiori di 1 anno in condizioni ambientali (25°C)

Se il test preliminare indica che il 50 % della sostanza (o più del 50 %) è idrolizzata in 2,4 ore a 50°C , oppure che meno del 10 % è idrolizzato dopo 5 giorni a ciascuno dei valori di pH (4, 7 e 9) nessun altro saggio deve essere eseguito

Diversamente, e per quei valori di pH in cui non si verifica questa condizione, si esegue il test n° 1

1.6.5.2 Test n° 1

Il test n° 1 viene eseguito ad una temperatura, preferibilmente a $50 \pm 0,5^\circ\text{C}$ in condizioni sterili se la sostanza è biodegradabile, a quei valori di pH in cui il saggio preliminare ha mostrato la necessità di ulteriore sperimentazione

Un numero sufficiente, non inferiore a 4, di campioni deve essere prelevato dopo tempi di reazione tali che la quantità di sostanza idrolizzata sia compresa nell'intervallo da 20 a 70 %, ciò al fine di verificare se la reazione ai valori di pH in esame sia di *pseudo* primo ordine

Per ciascun pH si determina l'ordine di reazione

1.3 SOSTANZE DI RIFERIMENTO

Quando si esamini una nuova sostanza, non è sempre necessario fare uso di sostanze di riferimento, che andrebbero soprattutto utilizzate per controllare saltuariamente il funzionamento del metodo e per rendere possibile il confronto con risultati ottenuti impiegando un altro metodo.

Come sostanze di riferimento sono state usate le seguenti sostanze (1):

acido acetilsalicilico (aspirina)

0,0-dietyl-0-(6-metil-2-(1-metiletil)-4-pirimidinil)-fosfotioato (dimpilato, diazinone)

1.4 PRINCIPIO DEL METODO

Si prepara una soluzione diluita della sostanza in acqua, si controllano pH e temperatura.

La diminuzione della concentrazione della sostanza in funzione del tempo viene seguita mediante una adeguata metodologia analitica.

I valori del logaritmo delle concentrazioni vengono riportati in un grafico in funzione del tempo; qualora si ottenga una linea retta, la costante di idrolisi viene calcolata dalla pendenza della retta (vedi paragrafo 2).

Può verificarsi il caso in cui la costante di velocità non sia, in pratica, misurabile direttamente ad una particolare temperatura; in tal caso può essere ricavata indirettamente applicando la relazione di Arrhenius che esprime la dipendenza delle costanti di velocità dalla temperatura. La costante non direttamente misurabile può cioè essere ottenuta per estrapolazione, utilizzando la retta che esprime la variazione del logaritmo della costante di velocità, misurata ad opportune temperature, in funzione dell'inverso della temperatura assoluta (K).

1.5 CRITERI DI QUALITÀ

Dal riferimento bibliografico (2) risulta che misure di velocità di idrolisi, quali quelle eseguite su 13 classi di strutture organiche, possono avere un'elevata precisione. La ripetibilità dipende in particolare dal controllo del pH e della temperatura e può essere influenzata dalla presenza di microorganismi e, in casi particolari, dalla concentrazione dell'ossigeno disciolto.

1.6 DESCRIZIONE DEL METODO

1.6.1 Reagenti

1.6.1.1 Soluzioni tampone

La sperimentazione deve essere eseguita ai valori di pH: 4,0, 7,0 e 9,0.

A tale scopo si devono preparare soluzioni tampone impiegando reagenti puri di grado analitico ed acqua distillata o deionizzata e sterile. Nell'appendice sono presentati alcuni esempi di sistemi tampone.

È opportuno osservare che il sistema tampone impiegato può influenzare la velocità d'idrolisi; in tal caso, si utilizzerà un altro sistema tampone. Nel riferimento bibliografico (2) si consiglia l'uso di tamponi borato o acetato anziché fosfato.

Qualora il pH di una soluzione tampone alla temperatura di sperimentazione non sia noto, esso deve essere determinato, alla temperatura prescelta, con precisione pari a $\pm 0,1$ unità di pH mediante un pHmetro tarato.

1.6.1.2 Soluzioni in esame

La sostanza in esame va disciolta nella soluzione tampone. La sua concentrazione non dovrebbe essere maggiore di 0,01 M o della metà della concentrazione di saturazione (la concentrazione da utilizzare è, tra le due, quella che risulta più bassa).

Valutazione della costante di velocità a 25 °C

La decisione su come procedere sperimentalmente dipende dall'ordine di reazione determinato mediante il test n. 1: la reazione può essere di *pseudo*-prim'ordine, oppure no.

Se non è possibile concludere con certezza che la reazione è di prim'ordine, si prosegue la sperimentazione secondo quanto descritto nel test n. 2.

Se invece si può senza incertezze concludere, in base al test n. 1, che la reazione è di *pseudo*-prim'ordine, si prosegue la sperimentazione come descritto nel test n. 3. Alternativamente, in particolari circostanze, potrebbe essere possibile calcolare la costante di velocità a 25 °C in base al valore della costante a 50 °C ottenuta mediante i risultati del test n. 1 (vedi paragrafo 3.2).

1.6.5.3 *Test n. 2*

Questo saggio viene eseguito a ciascuno dei valori di pH indicati dai risultati del test n. 1.

- o ad una temperatura minore di 40 °C,
- oppure a due temperature maggiori di 50 °C e che differiscano tra di loro di almeno 10 °C.

Per ciascun valore di pH e di temperatura in cui si esegue il test n. 2 si dovranno prelevare almeno 6 campioni della soluzione tali che si possa disporre di 6 valori di concentrazione opportunamente distanziati e relativi a stadi di avanzamento dell'idrolisi compresi tra il 20 e il 70 %.

Per un valore di pH ed una temperatura, si dovrà effettuare una determinazione in doppio. Qualora il test n. 2 sia fatto a due temperature, la determinazione in doppio dovrà essere fatta per la minore delle due.

Per ciascun valore di pH e della temperatura in cui è stato eseguito il test n. 2, sarà dato, se possibile, una valutazione grafica del tempo di dimezzamento.

1.6.5.4 *Test n. 3*

Questo saggio viene eseguito a ciascuno dei valori di pH indicati dai risultati del test n. 1.

- o ad una temperatura minore di 40 °C,
- oppure a due temperature maggiori di 50 °C e che differiscano tra loro di almeno 10 °C.

Per ciascun valore di pH e di temperatura in cui si esegue il test n. 3 si dovranno prelevare 3 campioni: il primo relativo al tempo 0 e il secondo e il terzo dopo tempi di reazione tali che lo stato di avanzamento dell'idrolisi superi il 30 %. Si calcolano infine, se è possibile, la costante $k_{0.55}$ e il tempo di dimezzamento ($t_{1/2}$).

2 DATI

Per le reazioni di *pseudo*-prim'ordine, i valori di $k_{0.55}$ per ciascun valore di pH e della temperatura possono essere ottenuti dal grafico del logaritmo della concentrazione in funzione del tempo usando l'espressione

$$k_{0.55} = - \text{pendenza} \times 2,303 \quad (7)$$

Il tempo di dimezzamento può essere calcolato usando l'equazione (6)

La costante di velocità a 25 °C, $k_{25\text{ °C}}$, può essere calcolata, ove necessario, mediante l'equazione di Arrhenius

Per le reazioni che non sono di *pseudo* prim'ordine vedi paragrafo 3.1

3 RELAZIONE

3.1 RELAZIONE SUL SAGGIO

La relazione di prova deve, se possibile, includere le seguenti informazioni:

- descrizione precisa della sostanza,
- ogni risultato ottenuto con sostanze di riferimento,
- il principio e i dettagli del metodo analitico usato,
- per ciascun saggio: temperatura, pH, composizione del tampone e una tabella di tutte le coppie di valori concentrazione-tempo,
- per le reazioni di *pseudo*-prim'ordine: i valori di k_{obs} , $t_{1/2}$ e la procedura di calcolo,
- per le reazioni non di *pseudo*-prim'ordine: i grafici dei risultati sotto forma di logaritmo della concentrazione in funzione del tempo,
- tutte le informazioni ed osservazioni necessarie per la valutazione dei risultati

3.2 INTERPRETAZIONE DEI RISULTATI

Può essere possibile calcolare un valore accettabile della costante di velocità (a 25 °C) della sostanza in esame, ammesso che già esistano valori sperimentali dell'energia di attivazione per sostanze omologhe alla sostanza in esame e ammesso che sia ragionevole assumere che l'energia di attivazione della sostanza in esame sia dello stesso ordine di grandezza delle energie d'attivazione sperimentali prese come riferimento.

C.8. TOSSICITÀ PER I LOMBRICHI

SAGGIO SU TERRENO ARTIFICIALE

1 METODO

1.1 Introduzione

In questo saggio di laboratorio la sostanza in esame viene aggiunta ad un terreno artificiale dove si pongono i lombrichi per quattordici giorni. Dopo tale periodo (facoltativamente dopo sette giorni) si esamina l'effetto letale della sostanza sui lombrichi. Il saggio fornisce un metodo di valutazione, a termine relativamente breve, dell'effetto sui lombrichi di sostanze chimiche assunte per via cutanea e alimentare.

1.2 Definizioni e unità

LC₅₀: concentrazione di una sostanza capace di uccidere il 50% degli animali in esame entro il periodo del saggio.

1.3 Sostanza di riferimento

Una sostanza di riferimento viene usata periodicamente per dimostrare che la sensibilità del sistema (di saggio) non è cambiata in modo significativo.

Come sostanza di riferimento si raccomanda cloroacetammide di grado analitico.

1.4 Principio del saggio

Il terreno è un elemento variabile; si usa pertanto, per questo saggio, un terreno fertile artificiale definito accuratamente. Lombrichi adulti della specie *Eisenia foetida* (vedi nota in appendice) vengono tenuti in un determinato terreno artificiale, trattato con diverse concentrazioni della sostanza in esame. Quattordici giorni (facoltativamente sette giorni) dopo l'inizio della prova, si sparge il contenuto dei recipienti su un vassoio e per ciascuna concentrazione si contano i lombrichi sopravvissuti.

1.5 Criteri di qualità

Il saggio è programmato in modo da essere il più possibile riproducibile per quanto concerne il substrato e gli organismi in esame. Alla fine del saggio, la mortalità fra gli animali di controllo non deve superare il 10%, altrimenti la prova non è valida.

1.6 Descrizione del metodo

1.6.1 Materiali

1.6.1.1 Substrato per il saggio

Come substrato di base per il saggio si usa un ben determinato terreno artificiale.

a) Substrato di base (percentuali espresse in peso secco)

- 10% di torba di stagno (con pH più vicino possibile a 5,5-6,0, priva di residui visibili di piante e finemente macinata);
- 20% di argilla caolinica preferibilmente con più del 50% di caolinite;
- circa 69% di sabbia quarzosa industriale (sabbia a grana prevalentemente fine con oltre il 50% dei granuli di dimensioni comprese fra 0,05 e 0,2 mm). Qualora la sostanza in esame non possa essere sufficientemente dispersa in acqua, per ogni recipiente (di saggio) andrebbero messi da parte 10 g di tale sabbia da mescolare successivamente con la sostanza stessa;
- circa 1% di carbonato di calcio (CaCO₃) in polvere, chimicamente puro, aggiunto per portare il pH a 6,0 ± 0,5.

b) Substrato per il saggio

Il substrato per il saggio contiene il substrato di base, la sostanza in esame e acqua deionizzata.

Il contenuto in acqua è circa dal 25 al 42% del peso secco del substrato di base.

Il contenuto in acqua del substrato si determina per essiccamento di un campione fino a peso costante, a 105 °C. Il criterio base è che il terreno artificiale deve essere addizionato con acqua fino al punto in cui non vi sia acqua stagnante. Nel mescolare si dovrebbe fare attenzione ad ottenere una distribuzione uniforme della sostanza in esame e del substrato. Il procedimento seguito per addizionare la sostanza in esame al substrato deve essere riportato.

c) Substrato di controllo

Il substrato di controllo contiene il substrato di base e l'acqua. Se si usa un additivo, un ulteriore controllo dovrebbe contenere la stessa quantità di additivo.

1.6.1.2. Recipienti per il saggio

Recipienti di vetro della capacità di circa un litro (adeguatamente coperti con coperchi di plastica, piatti o con una pellicola di plastica muniti di fori di ventilazione) vengono riempiti, sia per il saggio che per il controllo, con una quantità di substrato umido equivalente a 500 g di peso secco di substrato.

1.6.2. Condizioni della prova

I recipienti dovrebbero essere tenuti in camere climatizzate a 20 °C (± 2 °C) ed illuminate in continuazione. L'intensità luminosa dovrebbe essere compresa fra 400 e 800 lux.

La durata della prova è di quattordici giorni, ma è facoltativo fare una prima determinazione della mortalità a sette giorni dall'inizio del saggio.

1.6.3. Procedimento del saggio**Concentrazioni del saggio**

Le concentrazioni della sostanza in esame sono espresse in peso della sostanza per peso secco del substrato di base (mg/kg).

Saggio orientativo

L'intervallo delle concentrazioni che causano una mortalità variabile fra lo 0 ed il 100 % può essere determinato con un saggio orientativo che fornisca informazioni sull'intervallo di concentrazioni da impiegare nel saggio definitivo.

Si dovrebbe esaminare la sostanza alle seguenti concentrazioni: 1 000, 100, 10, 1, 0,1 mg di sostanza/kg di substrato in esame (peso secco).

Se si deve effettuare un saggio definitivo completo, per ogni prova orientativa e per il controllo non trattato, potrebbe essere sufficiente un gruppo di dieci lombrichi per ciascuna concentrazione.

Saggio definitivo

I risultati del saggio orientativo vengono impiegati per scegliere almeno 5 concentrazioni in serie geometrica, che causino una mortalità variabile fra lo 0 ed il 100 % e che differiscano fra loro per un fattore costante non superiore a 1,8.

Con questa serie di concentrazioni, il saggio dovrebbe consentire una stima la più precisa possibile del valore della LC_{50} e dei suoi limiti di confidenza.

Nella prova definitiva si usano almeno quattro gruppi di saggio per concentrazione e quattro per controlli non trattati, ciascuno con dieci lombrichi. I risultati ottenuti con questi gruppi saggiati in replicato vengono espressi con il valore medio e con la deviazione standard relativa.

Quando due concentrazioni consecutive, nel rapporto 1,8, danno una mortalità pari allo 0 ed al 100 %, questi due valori sono sufficienti ad indicare l'intervallo entro il quale è compresa la LC_{50} .

Miscela del substrato di base per il saggio e della sostanza in esame

Se possibile, il substrato per il saggio dovrebbe essere preparato senza alcun additivo che non sia acqua. Subito prima dell'inizio del saggio, si mescola con il substrato di base, oppure vi si sparge sopra uniformemente, con uno spruzzatore da cromatografia o dispositivo simile, un'emulsione o dispersione in acqua deionizzata o in altro solvente della sostanza da esaminare.

Se insolubile in acqua, la sostanza in esame può essere disciolta nel minor volume possibile di un idoneo solvente organico (per esempio esano, acetone, cloroformio).

Per solubilizzare, disperdere o emulsionare la sostanza in esame, si possono impiegare soltanto agenti che volatilizzano rapidamente. Prima dell'uso occorre ventilare il substrato per il saggio. Si deve aggiungere una quantità di acqua pari a quella evaporata. Il controllo dovrebbe contenere la stessa quantità di tutti gli additivi.

Se la sostanza in esame non è solubile, disperdibile o emulsionabile in solventi organici, 10 g di una miscela costituita da sabbia fine quarzosa e dalla quantità di sostanza in esame necessaria per trattare 500 g di peso secco di terreno artificiale, vengono mescolate con 490 g di peso secco del substrato per il saggio.

Per ciascun gruppo di saggio, si riempie ogni recipiente di vetro con una quantità di substrato umido equivalente a 500 g di peso secco, e sulla superficie del substrato si collocano 10 lombrichi precedentemente condizionati per 24 ore in un simile substrato umido e quindi lavati rapidamente ed asciugati dell'acqua in eccesso per assorbimento su carta da filtro.

I recipienti vengono coperti con coperchi, piatti o pellicole di plastica perforati per impedire l'essiccamento del substrato e sono mantenuti nelle condizioni sperimentali per quattordici giorni.

Le valutazioni andrebbero effettuate quattordici giorni (facoltativamente sette giorni) dopo l'inizio del saggio. Si sparge il substrato su un piatto di vetro o di acciaio inossidabile. Si esaminano i lombrichi e si determina il numero di quelli sopravvissuti. I lombrichi sono considerati morti se non reagiscono ad un leggero stimolo meccanico sull'estremità anteriore.

Se l'esame è effettuato dopo sette giorni, il recipiente è riempito di nuovo con lo stesso substrato ed i lombrichi sopravvissuti vengono collocati sulla sua superficie.

1.6.4. *Organismi per il saggio*

Gli organismi per il saggio dovrebbero essere individui adulti di *Eisenia foetida* (vedi la nota dell'allegato) (di almeno due mesi con clitella) del peso umido di 300-600 mg. (Per il metodo di allevamento vedi allegato).

2 DATI

2.1. Trattamento e valutazione dei risultati

Si riportano le concentrazioni della sostanza esaminata con le rispettive percentuali di lombrichi morti.

Quando i dati sono affidabili si dovrebbero determinare il valore della LC_{50} e i limiti di confidenza ($P = 0,05$) utilizzando metodi standard (Litchfield e Wilcoxon, 1949 o un metodo equivalente). Il valore della LC_{50} dovrebbe essere espresso in mg di sostanza in esame per kg di substrato per il saggio (peso secco).

Nei casi in cui la pendenza della curva di concentrazione sia troppo elevata per consentire il calcolo della LC_{50} , è sufficiente una stima grafica di tale valore.

Quando due concentrazioni consecutive, nel rapporto di 1,8, danno mortalità pari allo 0 % ed al 100 %, questi due valori sono sufficienti per indicare l'intervallo entro il quale è situata la LC_{50} .

3 RELAZIONE

3.1. Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- la dichiarazione che la prova è stata eseguita conformemente ai criteri di qualità sopra riportati,
- il saggio effettuato (saggio orientativo e/o saggio definitivo),
- l'esatta descrizione delle condizioni in cui è stato effettuato il saggio o la dichiarazione che il saggio è stato condotto conformemente al metodo, qualsiasi modifica del procedimento deve essere riportata,
- l'esatta descrizione del procedimento seguito per mescolare la sostanza in esame con il substrato di base,
- informazioni sugli organismi impiegati per il saggio (specie, età, media ed intervallo di variazione del peso, condizioni di mantenimento e di allevamento forniture),
- il metodo seguito per la determinazione della LC_{50} ,
- i risultati del saggio comprensivi di tutti i dati utilizzati,
- la descrizione dei sintomi e dei cambiamenti osservati nel comportamento degli organismi per il saggio,
- la mortalità nei controlli,
- la LC_{50} oppure la più elevata concentrazione saggiata che non provoca mortalità e la più bassa concentrazione saggiata che provoca il 100 % di mortalità, a quattordici giorni (facoltativamente a sette giorni) dopo l'inizio della prova,
- il grafico della curva concentrazione/risposta,
- i risultati ottenuti con la sostanza di riferimento, specificando se siano stati ottenuti in associazione con il saggio in questione o da precedenti saggi di controllo di qualità.

Appendice

Allevamento e mantenimento dei lombrichi prima del saggio

Per l'allevamento si pongono gli animali, da 30 a 50 lombrichi adulti, in una scatola di allevamento con substrato fresco e si rimuovono dopo 14 giorni. Questi animali possono essere utilizzati per ulteriori gruppi di allevamento. I lombrichi nati dalle zooteche vengono impiegati per i saggi quando sono maturi (nelle condizioni prescritte, dopo 2-3 mesi).

Condizioni di allevamento e mantenimento

Camera climatizzata: temperatura di 20 °C (\pm 2 °C), di preferenza illuminata ininterrottamente (intensità da 400 a 800 lux).

Scatole di allevamento: idonei contenitori poco profondi del volume da 10 a 20 litri.

Substrato: *Eisenia foetida* può essere allevata in diversi escrementi animali. Come terreno per l'allevamento si raccomanda l'uso di una miscela costituita dal 50 % in volume di torba e dal 50 % di sterco di mucca o di cavallo. Il terreno dovrebbe avere un pH di circa 6-7 (corretto con carbonato di calcio) ed una bassa conduttività ionica (meno di 6 mmhos o 0,5 % di concentrazione salina).

Il substrato dovrebbe essere umido ma non troppo bagnato.

Oltre al metodo sopra esposto si possono impiegare con buoni risultati anche altri procedimenti.

Nota: Esistono due varietà di *Eisenia foetida* che alcuni tassonomi hanno separato in specie (Bouche, 1972). Queste sono morfologicamente simili ma una, la *Eisenia foetida foetida*, ha delle tipiche strisce o fasce trasversali sui segmenti mentre l'altra, la *Eisenia foetida andrei*, ne è priva ed ha un colore rossiccio screziato. Ove possibile si dovrebbe usare la *Eisenia foetida andrei*. Se è disponibile la metodologia necessaria, si possono usare altre specie.

C.9. BIODERADAZIONE

ZAHN-WELENS TEST

1. METODO

1.1. Introduzione

Il metodo è destinato a valutare la potenziale biodegradabilità ultima ⁽¹⁾ delle sostanze organiche idrosolubili e non volatili esposte a concentrazioni relativamente elevate di microorganismi nel corso di un saggio statico.

Può verificarsi un assorbimento chimico-fisico della sostanza in esame sui solidi sospesi, di ciò si dovrà tener conto nell'interpretare i risultati (vedi punto 3.2).

Le sostanze da studiare vengono impiegate a concentrazioni corrispondenti a valori del DOC compresi fra 50 e 400 mg/l o a valori del COD compresi fra 100 e 1 000 mg/l (DOC = carbonio organico disciolto; COD = domanda chimica di ossigeno). Dette concentrazioni, relativamente elevate, hanno il vantaggio dell'attendibilità analitica. I composti dotati di proprietà tossiche possono ritardare o inibire il processo di degradazione.

In questo metodo, la misura della concentrazione del carbonio organico disciolto o la richiesta chimica di ossigeno vengono impiegate per valutare la biodegradazione ultima della sostanza in esame.

L'impiego simultaneo di un metodo di analisi specifico può permettere di valutare la biodegradazione primaria della sostanza (modifica della struttura chimica della sostanza in esame).

Il metodo può essere applicato soltanto all'esame di quelle sostanze organiche le quali, alle concentrazioni impiegate per la prova:

- sono solubili in acqua nelle condizioni sperimentali;
- hanno una tensione di vapore trascurabile nelle condizioni sperimentali;
- non esercitano effetti inibitori sui batteri;
- sono assorbite soltanto in misura limitata nel sistema sperimentale;
- non vanno perdute per effetto della formazione di schiume nella soluzione in esame.

La disponibilità di dati sulle proporzioni relative dei principali componenti del materiale da esaminare sarà utile per interpretare i risultati, particolarmente nei casi in cui i risultati sono bassi o trascurabili.

Per poter interpretare i risultati più bassi e per poter scegliere le opportune concentrazioni sperimentali sarà altresì utile disporre di dati sulla tossicità della sostanza nei confronti dei microorganismi.

1.2. Definizioni ed unità

Il livello di degradazione raggiunto alla fine dell'esperimento, denominato «biodegradabilità nel Zahn-Wellens Test», è dato dall'espressione:

$$D_T (\%) = \left[1 - \frac{(C_T - C_B)}{(C_A - C_{BA})} \right] \times 100$$

D_T = biodegradazione (%) al tempo T

C_A = valori del DOC (o del COD) della miscela in esame, espressi in mg/l e misurati tre ore dopo l'inizio della prova (DOC = carbonio organico disciolto, COD = domanda chimica di ossigeno)

C_T = valori del DOC o del COD nella miscela in esame al momento del prelievo (mg/l)

C_B = valori del DOC o del COD relativi al «bianco» al momento del prelievo (mg/l)

C_{BA} = valori del DOC o del COD del «bianco», misurati tre ore dopo l'inizio della prova (mg/l)

L'entità della degradazione dev'essere arrotondata all'unità percentuale.

La degradazione percentuale si esprime come eliminazione percentuale del DOC (o del COD) della sostanza sperimentata.

La differenza tra il valore misurato dopo tre ore e il valore calcolato, o preferibilmente misurato inizialmente, può fornire informazioni utili in merito all'eliminazione della sostanza (vedi punto 3.2: «Interpretazione dei risultati»).

⁽¹⁾ I termini «ultima» e «primaria», riferiti alla biodegradazione, sono traduzioni dei termini inglesi «ultimate» e «primary», rispettivamente.

1.3. Sostanze di riferimento

In taluni casi, quando vengono studiate sostanze nuove, può essere utile l'impiego di sostanze di riferimento. Tuttavia, non possono ancora essere raccomandate specifiche sostanze di riferimento.

1.4. Principio del metodo

In un recipiente di vetro da 1 a 4 litri, provvisto di agitatore e aereatore, vengono introdotti contemporaneamente il fango attivo, le sostanze nutritive minerali e il materiale da esaminare, quale unica fonte di carbonio, in soluzione acquosa. La miscela viene agitata ed aereata alla temperatura di 20-25 °C, sotto illuminazione diffusa o in camera oscura, per la durata massima di 28 giorni. Il processo di degradazione viene seguito mediante determinazione dei valori del COD o del DOC nella soluzione filtrata, eseguita giornalmente o comunque ad intervalli appropriati e regolari. Il rapporto fra il DOC (o il COD) eliminato dopo ciascun intervallo ed il valore a tre ore dall'inizio viene espresso come biodegradazione percentuale e serve per misurare l'entità della degradazione in quel momento. Diagrammando tale valore in funzione del tempo si costruisce la curva di biodegradazione. Impiegando un metodo analitico specifico è possibile misurare le variazioni di concentrazione della sostanza in esame dovute alla biodegradazione (biodegradabilità primaria).

1.5. Criteri di qualità

Prove d'intercalibrazione tra laboratori hanno dimostrato che la riproducibilità di questo metodo è soddisfacente.

La sensibilità del metodo è determinata principalmente dalla variabilità del «bianco» e, in misura minore, dalla precisione con cui è possibile determinare il carbonio organico disciolto e la quantità del composto da esaminare contenuto nel mezzo.

1.6. Descrizione del metodo**1.6.1. Preparazioni****1.6.1.1. Reattivi**

- Acqua per il saggio: acqua potabile a contenuto di carbonio organico inferiore a 5 mg/l. La concentrazione globale degli ioni calcio e magnesio non deve superare 2,7 mmol/l; in caso contrario sarà necessaria un'opportuna diluizione con acqua deionizzata o distillata
- Acido solforico, p.a., 50 g/l
- Soluzione di idrossido di sodio, p.a., 40 g/l
- Soluzione nutritiva minerale: sciogliere in 1 litro d'acqua deionizzata:
 - cloruroammonico, NH_4Cl , p.a. 38,5 g
 - ortofosfato monosodico diidrato $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$, p.a. 33,4 g
 - ortofosfato monopotassico, KH_2PO_4 , p.a. 8,5 g
 - ortofosfato dipotassico, K_2HPO_4 , p.a. 21,75 g

La miscela serve contemporaneamente da sostanza nutritiva e da tampone.

1.6.1.2. Apparecchiatura

Recipienti cilindrici di vetro, del volume da 1 a 4 litri

Dispositivo di agitazione. L'agitatore vero e proprio, di vetro o metallo, dev'essere sostenuto da un albero adatto e deve girare a 5-10 cm circa dal fondo del recipiente. Si può anche impiegare un agitatore magnetico, con barretta da 7 a 10 cm di lunghezza

Tubo di vetro, del diametro interno di 2-4 mm, per l'introduzione dell'aria. L'apertura del tubo deve trovarsi a 1 cm circa sopra il fondo del recipiente

Centrifuga (3 550 giri circa)

pH-metro

Misuratore dell'ossigeno disciolto

Filtri di carta

Apparecchiatura per filtrazione su membrana

Filtri a membrana, porosità 0,45 µm. I filtri a membrana sono adatti solo a condizione che non cedano carbonio organico e non assorbano la sostanza durante la filtrazione

Apparecchiatura analitica per la determinazione del contenuto in carbonio organico e della domanda chimica di ossigeno

1.6.1.3 Preparazione dell'inoculo

Lavare il fango attivo proveniente da un impianto di trattamento biologico centrifugando o lasciando sedimentare ripetutamente con l'acqua per il saggio (vedi sopra).

Il fango attivo deve trovarsi in idonee condizioni. Esso può essere prelevato da un impianto di trattamento di acque di scarico in buone condizioni di funzionamento. Per ottenere il maggior numero possibile di specie o ceppi differenti di batteri è preferibile mescolare gli inoculi provenienti da varie fonti (per esempio: vari impianti di trattamento, estratti di suoli, acque di fiume, ecc.). La miscela deve essere trattata come descritto sopra.

Per controllare l'attività del fango attivo vedi oltre il paragrafo «Controllo funzionale».

1.6.1.4 Preparazione delle soluzioni da esaminare

Nel recipiente per il saggio, introdurre 500 ml dell'acqua per il saggio, insieme alla soluzione nutritiva minerale in quantità pari a 2,5 ml/l e al fango attivo in quantità corrispondente a 0,2-1,0 g/l di materiale secco nella miscela finale. Aggiungere la soluzione madre della sostanza da esaminare in quantità tale da ottenere un DOC da 50 a 400 mg/l nella miscela finale. I corrispondenti valori del COD saranno da 100 a 1.000 mg/l. Portare con l'acqua di cui sopra al volume totale da 1 a 4 litri. Il volume totale da scegliere dipende dal numero dei campioni da prelevare per le determinazioni del DOC o del COD, nonché dai volumi necessari per il procedimento analitico.

Normalmente, un volume di 2 litri può essere considerato soddisfacente.

Per ciascuna serie di saggi va preparato almeno un recipiente di controllo (bianco): esso deve contenere soltanto il fango attivo e la soluzione nutritiva minerale portata allo stesso volume totale dei recipienti per il saggio.

1.6.2. Esecuzione del saggio

Si agita il contenuto dei recipienti per il saggio con agitatori magnetici od a spirale, sotto illuminazione diffusa o in camera oscura e alla temperatura di 20-25 °C. L'aerazione dev'essere ottenuta insufflando aria compressa purificata facendola passare attraverso un tampone di cotone e, se necessario, una bottiglia di lavaggio. Si farà in modo che il fango non si depositi e che la concentrazione dell'ossigeno non scenda al di sotto di 2 mg/l.

Il valore del pH deve essere controllato ad intervalli regolari (ad esempio quotidianamente) e regolato se necessario sul valore di 7-8.

Le perdite dovute all'evaporazione andranno compensate immediatamente prima di ogni prelievo aggiungendo acqua deionizzata o distillata nelle quantità richieste. Sarà particolarmente utile segnare il livello del liquido sul recipiente prima di avviare la prova. Dopo ogni campionamento (in assenza di aerazione e agitazione) si apporranno nuovi contrassegni. I primi campioni dovranno sempre essere prelevati tre ore dopo l'inizio della prova per verificare se ha luogo un assorbimento del materiale in esame da parte del fango attivo.

L'eliminazione della sostanza in esame dev'essere seguita mediante determinazioni del DOC e del COD, effettuate quotidianamente o ad intervalli comunque regolari. I campioni prelevati dal recipiente di saggio e dal «bianco» devono essere filtrati su carta accuratamente lavata. I primi 5 ml del filtrato della soluzione devono essere scartati. I fanghi difficilmente filtrabili possono essere eliminati in precedenza centrifugando per 10 minuti. Le determinazioni del COD e del DOC devono essere effettuate almeno in doppio. L'esperimento deve proseguire per la durata di 28 giorni.

Nota: I campioni che rimangono torbidi devono essere filtrati attraverso filtri a membrana. Questi ultimi non devono cedere od assorbire materiale organico.

Controllo funzionale del fango attivo

In parallelo a ciascuna serie di esperimenti, deve essere saggiata una sostanza nota, destinata a controllare la capacità funzionale del fango attivo. A questo scopo si è mostrato utile il glicoldietilenico.

Adattamento

Qualora si eseguano analisi ad intervalli relativamente brevi (ad esempio quotidianamente), l'adattamento può essere chiaramente controllato dalla curva di degradazione (vedi figura 2). Il saggio, pertanto, non deve essere avviato immediatamente prima dell'interruzione di fine settimana.

Qualora l'adattamento si verifichi verso la fine del periodo di saggio, il saggio stesso può essere prolungato fino al momento in cui la degradazione è terminata.

Nota: Se è necessaria una conoscenza più vasta del comportamento dei fanghi adattati, lo stesso fango attivo deve essere posto nuovamente a contatto con lo stesso materiale di prova, procedendo come segue:

arrestare l'agitatore e l'aeratore e lasciar sedimentare il fango attivo; eliminare il surnatante, riempire fino a 2 litri con acqua per il saggio, agitare per 15 minuti e lasciare nuovamente sedimentare; eliminare nuovamente il surnatante e impiegare il fango rimanente per ripetere il saggio con gli stessi materiali conformemente a quanto indicato ai precedenti punti 1.6.1.4 e 1.6.2. Il fango attivo può essere isolato anche per centrifugazione anziché per sedimentazione.

Il fango adattato può essere mescolato con fango fresco, fino ad una quantità totale di 0,2-1 g di sostanza secca per litro.

Mezzi analitici

Normalmente i campioni vengono filtrati attraverso un filtro di carta accuratamente lavato (per il lavaggio, impiegare acqua deionizzata)

I campioni che restano torbidi devono essere filtrati con filtri a membrana (0,45 µm)

La concentrazione del DOC dev'essere determinata in doppio sul campione filtrato (scartando i primi 5 ml) con apparecchiatura per la determinazione del TOC. Se il filtrato non può essere analizzato lo stesso giorno, esso va conservato in frigorifero fino al giorno successivo. Una conservazione più lunga non è da raccomandarsi.

La concentrazione del COD va determinata sul campione filtrato con il procedimento analitico descritto nel riferimento (bibliografico 2)

2 DATI E VALUTAZIONE

Le concentrazioni del DOC e del COD devono essere determinate almeno in doppio in ogni campione secondo quanto indicato al punto 1.6.2. La degradazione al momento T viene calcolata mediante la formula riportata (insieme alle definizioni) al punto 1.2.

La misura della degradazione dev'essere arrotondata all'unità percentuale. L'entità della degradazione raggiunta, alla fine dell'esperimento viene definita come «biodegradabilità secondo Zahn-Wellens».

Nota. Qualora la degradazione completa venga raggiunta prima che il tempo necessario per il saggio sia terminato e questo risultato sia confermato da una seconda analisi effettuata il giorno successivo, il saggio può essere considerato concluso.

3 RELAZIONE**3.1 Relazione sul saggio**

Nella relazione sul saggio devono figurare, se possibile:

- la concentrazione iniziale della sostanza,
- tutte le altre informazioni e risultati sperimentali concernenti la sostanza esaminata, la sostanza di riferimento (se impiegata) e il «bianco»,
- la concentrazione dopo tre ore,
- la curva di biodegradazione con la relativa descrizione,
- la data e la località di prelievo dei microorganismi usati per l'esperimento, lo stato di adattamento, la concentrazione impiegata, ecc.
- le giustificazioni scientifiche per qualsiasi modifica apportata al procedimento sperimentale.

3.2 Interpretazione dei risultati

La rimozione del DOC (o del COD) che si verifica gradualmente entro giorni o settimane indica che la sostanza in esame sta subendo biodegradazione.

In taluni casi può comunque entrare in gioco l'assorbimento chimico-fisico, denotato dal fatto che lo scompostosi verifica in modo completo o parziale fin dall'inizio, entro le prime tre ore e che la differenza di risposta tra i surnatanti del controllo e del saggio rimane a livelli inaspettatamente bassi.

Se si vuole distinguere fra la biodegradazione (o biodegradazione parziale) e l'assorbimento, sono necessari ulteriori saggi.

Ciò può essere fatto in numerosi modi, ma il metodo più convincente consiste nell'impiegare il surnatante quale inoculo in una prova del dossier di base (preferibilmente un saggio respirometrico).

Le sostanze che, nel corso di questo saggio, mostrano un'elevata eliminazione del DOC (o del COD) non dovuta ad assorbimento devono essere considerate potenzialmente biodegradabili. Una rimozione parziale, non dovuta ad assorbimento indica che il prodotto chimico è soggetto almeno in parte alla biodegradazione.

Una rimozione bassa o nulla del DOC (o del COD) può essere dovuta all'inibizione dei microorganismi da parte delle sostanze in esame: ciò può anche essere rivelato dalla lisi e dalla perdita di fango, accompagnata dalla formazione di surnatanti torbidi. In questo caso il saggio deve essere ripetuto impiegando la sostanza in esame a concentrazione minore.

L'impiego di un metodo di analisi specifico per la sostanza in esame o della sostanza marcata con ^{14}C può consentire una maggiore sensibilità. Nel caso di composto marcato al ^{14}C , il recupero di $^{14}\text{CO}_2$ confermerà che la biodegradazione è avvenuta.

Quando i risultati sono espressi in termini di biodegradazione primaria, dovrà essere fornita, possibilmente, una spiegazione della modifica di struttura chimica che conduce alla diminuzione di risposta della sostanza in esame.

Si deve dimostrare la validità del metodo analitico e fornire la risposta ottenuta sul «bianco».

C.10. BIODEGRADAZIONE

SAGGIO DI SIMULAZIONE CON FANGHI ATTIVI

1 METODO

1.1 Introduzione

1.1.1 Osservazioni generali

Il metodo può essere applicato esclusivamente a quelle sostanze organiche che, alle concentrazioni impiegate per il saggio,

- sono solubili in acqua nella misura necessaria per la preparazione delle soluzioni per il saggio,
- hanno, nelle condizioni del saggio, una tensione di vapore trascurabile,
- non esercitano effetti inibitori sui batteri

La disponibilità di dati sulle proporzioni relative dei principali componenti del prodotto da esaminare sarà utile per interpretare i risultati ottenuti, in particolare in quei casi in cui i valori trovati sono bassi o non significativi.

E' auspicabile poter disporre di dati sulla tossicità della sostanza nei confronti dei microorganismi per l'interpretazione di eventuali bassi valori e per la scelta delle concentrazioni sperimentali appropriate.

1.1.2 Determinazione della biodegradabilità ultima (analisi DOC/COD) ⁽¹⁾

Scopo del metodo è la determinazione della biodegradabilità ultima mediante misura della rimozione della sostanza e di qualsiasi metabolita in un impianto modello a fanghi attivi, ad una concentrazione > 12 mg DOC/l (o a circa 40 mg COD/l). Sembrano ottimali 20 mg DOC/l (DOC = carbonio organico disciolto/litro, COD = domanda chimica di ossigeno).

Si deve determinare il contenuto di carbonio organico (o la domanda chimica di ossigeno) del materiale in esame.

1.1.3 Determinazione della biodegradabilità primaria (analisi specifica) ⁽¹⁾

Scopo del metodo è la determinazione della biodegradabilità primaria di una sostanza in un impianto pilota a fanghi attivi, a una concentrazione di circa 20 mg/l, con l'impiego di un metodo analitico specifico (se il metodo analitico e la tossicità della sostanza lo consentono, si può usare una concentrazione più bassa o più elevata). Questo consente la valutazione della biodegradabilità primaria della sostanza (modifica della struttura chimica della sostanza in esame).

Il metodo non è destinato alla determinazione della mineralizzazione della sostanza esaminata.

Per la determinazione della sostanza esaminata occorre disporre di un metodo analitico adeguato.

1.2 Definizioni e unità

1.2.1 Analisi DOC/COD

Il grado di rimozione della sostanza è dato da

$$DR = \frac{T - (E - E_0)}{T} \times 100\% \quad [1a]$$

dove

DR = grado di rimozione percentuale del DOC (o del COD) relativo alla sostanza in esame entro il tempo medio di ritenzione fissato

T = concentrazione della sostanza in esame nell'affluente in mg DOC/litro (o mg COD/litro)

E = concentrazione del DOC (o del COD) nell'effluente dell'unità per il saggio in mg DOC/litro (o mg COD/litro)

E₀ = concentrazione del DOC (o del COD) nell'effluente dell'unità per il «bianco» in mg DOC/litro (o mg COD/litro)

La degradazione si definisce come la rimozione percentuale di DOC (o di COD), nel tempo di ritenzione fissato, relativo alla sostanza in esame.

⁽¹⁾ I termini «ultima» e «primaria», riferiti alla biodegradazione, sono traduzioni dei termini inglesi «ultimate» e «primary», rispettivamente.

1.2.2. *Analisi specifica*

L'eliminazione percentuale della sostanza esaminata dalla fase acquosa (R_w), nel tempo medio di ritenzione fissato, si ricava da

$$R_w = \frac{C_i - C_o}{C_i} \times 100\% \quad \{1\text{ h}\}$$

dove

C_i = concentrazione della sostanza nell'affluente dell'unità per il saggio (mg di sostanza/litro, determinati con l'analisi specifica)

C_o = concentrazione della sostanza nell'effluente dell'unità per il saggio (mg di sostanza/litro, determinati con l'analisi specifica)

1.3. *Sostanze di riferimento*

In alcuni casi, quando si esamina una nuova sostanza, possono essere utili delle sostanze di riferimento, ciò nonostante, non è attualmente possibile indicare sostanze di riferimento specifiche

1.4. *Principio del metodo*

Per la determinazione della biodegradabilità ultima si fanno funzionare in parallelo due unità pilota a laghi attivi (saggio di conferma dell'OCSE o unità a vaso poroso). La sostanza in esame viene addizionata all'affluente (liquame sintetico o domestico) di una delle unità, mentre l'altra riceve soltanto liquame. Per la determinazione della biodegradazione primaria con l'analisi specifica dell'affluente e dell'effluente si impiega soltanto una unità.

Si misurano le concentrazioni di DOC (o di COD) negli effluenti, oppure si determinano con l'analisi specifica le concentrazioni della sostanza.

Il DOC dovuto alla sostanza in esame non viene misurato ma soltanto specificato. Quando si effettuano le misurazioni del DOC (e del COD), si assume che la differenza fra le concentrazioni medie degli effluenti del saggio e del controllo sia dovuta alla sostanza in esame non degradata.

Quando vengono effettuate analisi specifiche è possibile misurare la variazione della concentrazione della sostanza in esame (biodegradazione primaria).

Si possono fare funzionare le unità seguendo il "sistema delle unità accoppiate", con il procedimento della transinoculazione.

1.5. *Criteri di qualità*

La concentrazione di partenza della sostanza dipende dal tipo di analisi effettuata e dalle sue limitazioni.

1.6. *Descrizione del metodo*1.6.1. *Preparazione*1.6.1.1. *Apparecchiatura*

A parte il caso delle analisi specifiche, è necessaria una coppia di unità dello stesso tipo. Possono essere impiegati due sistemi:

Saggio di conferma OCSE

L'apparecchiatura (allegato I) è costituita da un serbatoio (A) per il liquame sintetico, da una pompa di dosaggio (B), da una vasca di aerazione (C), da un sedimentatore (D), una pompa ad aria compressa (E) per riciclare i fanghi attivi e una vasca (F) per raccogliere l'effluente trattato.

I serbatoi (A) e (F) devono essere di vetro o di idoneo materiale plastico, e della capacità di almeno 24 litri. La pompa (B) alimenta con un flusso costante di liquame sintetico la vasca di aerazione; si può impiegare qualsiasi sistema idoneo purché sia in grado di assicurare il flusso e la concentrazione di alimentazione.

Durante il normale funzionamento, l'altezza del sedimentatore (D) è fissata in modo che il volume della soluzione chiarificata contenuto nella vasca di aerazione sia di tre litri. Un diffusore di materiale sinterizzato (C) è sospeso nel recipiente (C) al vertice del cono. La quantità di aria insufflata attraverso l'aeratore può essere determinata con un flussometro. La pompa ad aria compressa (E) è regolata in modo che il fango attivo sia riciclato con continuità e regolarità dal sedimentatore al recipiente di aerazione (C).

«Vaso poroso»

Il vaso poroso è realizzato con fogli di polietilene poroso (spessore 2 mm, dimensione massima dei pori 95 µm), a forma cilindrica del diametro di 14 cm e con una base conica a 45° (figure 1 e 2 dell'allegato II). Il vaso poroso è contenuto in un recipiente impermeabile di plastica idonea del diametro di 15 cm, con una luce sulla parte cilindrica ad una altezza di 17,2 cm che determina il volume (tre litri) del vaso. Nella parte superiore del recipiente interno si trova un anello rigido di sostegno in plastica idonea in modo da avere un'intercapedine di efflusso di 0,5 cm fra il recipiente interno e quello esterno.

I vasi porosi possono essere montati sul fondo di un bagnomaria controllato termostaticamente. Alla base del recipiente interno, dove sono collocati idonei diffusori, si ha un'alimentazione di aria.

I recipienti (A) ed (E) debbono essere di vetro o di plastica idonea ed avere una capacità di almeno 24 litri. La pompa (B) alimenta, con un flusso costante di liquame sintetico, il recipiente di aerazione; si può impiegare qualsiasi sistema atto ad assicurare il flusso e la concentrazione di alimentazione.

Sono necessari dei vasi porosi interni di riserva per sostituire quelli che possono ostruirsi durante l'uso; i vasi ostruiti vengono puliti mediante immersione per 24 ore in una soluzione di ipoclorito seguita da un lavaggio accurato con acqua di rubinetto.

1.6.1.2. Filtrazione

Apparecchiatura per filtrazione su membrana e membrane filtranti con pori da 0,45 µm. Le membrane filtranti sono adatte soltanto se non cedono carbonio organico e non assorbono la sostanza durante la filtrazione.

1.6.1.3. Liquame

Si possono impiegare sia un'idonea alimentazione sintetica, sia liquame domestico

Esempio di alimentazione sintetica

Sciogliere in un litro di acqua di rubinetto i seguenti composti:

Peptone:	160 mg
Estratto di carne:	110 mg
Urea:	30 mg
NaCl:	7 mg
CaCl ₂ · 2H ₂ O:	4 mg
MgSO ₄ · 7H ₂ O:	2 mg
K ₂ HPO ₄ :	28 mg

Liquame domestico

Dovrebbe essere raccolto fresco ogni giorno dallo stramazzo della vasca di sedimentazione primaria di un impianto che tratta in prevalenza liquami domestici.

1.6.1.4. Soluzione madre della sostanza in esame

Si dovrebbe preparare una soluzione della sostanza in esame, ad esempio all'1 %, da aggiungere nell'unità di prova. E' necessario fissare la concentrazione della sostanza in modo tale che si conosca il volume necessario per ottenere la concentrazione di prova da aggiungere al liquame o direttamente nell'unità per mezzo di una seconda pompa.

1.6.1.5. Inoculo

Osservazione: Usando liquami domestici, sarebbe superfluo l'impiego di un inoculo a bassa concentrazione batterica, ma si possono usare fanghi attivi.

Possono essere usati svariati inoculi, se ne danno tre esempi adatti:

a) Inoculo da effluente secondario

Si dovrebbe ricavare l'inoculo da un effluente secondario di buona qualità raccolto da un impianto che tratta in prevalenza liquami domestici. Nel periodo compreso fra il campionamento e l'impiego, l'effluente deve essere tenuto in condizioni aerobiche. Per preparare l'inoculo, si filtra il campione su filtro a elevata porosità, scartando i primi 200 ml. Il filtrato è mantenuto in condizioni aerobiche sino al momento dell'uso. L'inoculo deve essere impiegato il giorno stesso del prelievo. Per l'inoculazione occorre impiegarne almeno 3 ml.

b) Inoculo composito

Inoculo da un effluente secondario:

vedi descrizione precedente.

Inoculo da terreno:

si sospendono 100 grammi di terreno (fertile, non sterile) in 1 000 ml di acqua potabile esente da cloro (terreni con un contenuto eccessivo di argilla, sabbia o humus non sono adatti). Dopo agitazione, si lascia riposare la sospensione per 30 minuti. Si filtra il surnatante su carta a elevata porosità, scartando i primi 200 ml. Si sottopone immediatamente il filtrato ad aerazione prolungandola fino al momento dell'uso. L'inoculo deve essere utilizzato il giorno stesso del prelievo.

Inoculo da acque superficiali:

un altro inoculo parziale può ottenersi da acque superficiali semiputride (mesosaprobiche). Si filtra il campione su carta ad elevata porosità, scartando i primi 200 ml. Si mantiene in condizioni aerobiche fino al momento dell'impiego. L'inoculo va utilizzato il giorno stesso del prelievo.

Si mettono insieme i volumi dei tre campioni parziali di inoculo, si mescolano bene e si preleva dal miscuglio ottenuto l'inoculo finale. Per l'inoculazione occorre che esso sia di almeno 3 ml.

c) Inoculo da un fango attivo

Si può usare come inoculo un volume (non più di tre litri) di fango attivo (contenuto in solidi sospesi fino a 2,5 g/l) prelevato dalla vasca di aerazione di un impianto che tratta prevalentemente liquami domestici.

1.6.2. Procedimento

Il saggio viene eseguito a temperatura ambiente; questa dovrebbe essere mantenuta fra 18 e 25 °C.

Se è il caso, il saggio può essere condotto a una temperatura più bassa (fino a 10 °C): se la sostanza viene degradata, allora non occorrono, di solito, altre operazioni. In caso contrario il saggio deve essere condotto ad una temperatura costante compresa fra 18 e 25 °C.

1.6.2.1. Periodo di avviamento: formazione/stabilizzazione del fango delle unità

Il periodo di formazione/stabilizzazione del fango è il periodo necessario perché la concentrazione dei solidi sospesi del fango attivo ed il funzionamento delle unità pervengano allo stato di regime nelle condizioni operative volute.

Il periodo di avviamento è quello che va dall'istante in cui la sostanza in esame è aggiunta per la prima volta fino all'istante in cui la sua rimozione si stabilizza (valore relativamente costante). Questo periodo non deve superare le sei settimane.

Il periodo di valutazione è di tre settimane a partire dall'istante in cui la rimozione della sostanza in esame raggiunge un valore relativamente costante che è di solito elevato. Per tutte le sostanze che, nelle prime sei settimane, mostrano una degradazione limitata o nulla, si prendono, come periodo di valutazione, le successive tre settimane.

All'inizio si riempie la (le) unità necessaria(e) per una prova con l'inoculo mescolato con l'affluente.

Si mettono allora in funzione l'aeratore (nel caso della unità del saggio di conferma OCSE la pompa ad aria compressa (E)) ed il meccanismo di dosaggio (B).

L'affluente, privo della sostanza da esaminare, deve attraversare il recipiente di aerazione (C) alla velocità di 1 l/h oppure 0,5 l/h; ciò comporta un tempo medio di ritenzione di tre o di sei ore.

La velocità di aerazione dovrebbe essere regolata in modo che il contenuto del recipiente (C) sia mantenuto costantemente in sospensione ed il volume di ossigeno disciolto sia di almeno 2 mg/l.

Va evitata, con mezzi adeguati, la formazione di schiuma. Non si devono usare agenti antischiumogeni che inibiscano il fango attivo.

Il fango accumulatosi nella parte superiore del recipiente di aerazione (C) [per le unità del saggio di conferma OCSE alla base del recipiente di sedimentazione (D) e nel circuito di circolazione] deve essere riportato nella soluzione chiarificata almeno una volta al giorno con l'uso di una spazzola o di qualche altro mezzo appropriato.

Quando il fango ha difficoltà a sedimentare, se ne può aumentare la densità aggiungendo delle porzioni di 2 ml di una soluzione al 5% di cloruro ferrico e ripetendo l'operazione quando necessario.

Si raccoglie l'effluente nel recipiente (E o F) per 20-24 ore e si preleva un campione dopo un'accurata miscelazione. Il recipiente (E o F) deve essere pulito molto bene.

Per poter determinare e controllare l'efficienza del processo, si misurano almeno due volte alla settimana la domanda chimica di ossigeno (COD) o il carbonio organico disciolto (DOC) del filtrato dell'effluente raccolto, come pure del filtrato dell'affluente (usando una membrana con pori di 0,45 µm e scartando i primi 20 ml circa di filtrato).

La riduzione del COD o DOC dovrebbe annullarsi quando si ottiene una degradazione giornaliera abbastanza regolare.

Due volte alla settimana si dovrebbe determinare la quantità (in g/l) di sostanza secca del fango attivo nel recipiente di aerazione. Le unità possono funzionare in due modi: o due volte per settimana si determina la quantità di sostanza secca presente nel fango attivo e se essa supera i 2,5 g/l si deve togliere quella in eccesso; oppure si eliminano giornalmente da ciascun vaso 500 ml di soluzione mista per avere un tempo di ritenzione medio del fango di 6 giorni.

Quando i parametri misurati e calcolati (efficienza del processo (nella rimozione COD o DOC), concentrazione del fango, capacità di sedimentazione del fango, torbidità degli effluenti, ecc.) delle due unità sono sufficientemente stazionari, la sostanza in esame può essere introdotta nell'affluente di una delle unità, secondo il punto 1.6.2.2.

In alternativa, la sostanza in esame può essere introdotta all'inizio del periodo di formazione del fango, specialmente quando come inoculo si aggiunge fango.

1.6.2.2. Procedimento

Si mantengono le condizioni di funzionamento del periodo di avviamento e si aggiunge all'affluente dell'unità di prova una quantità sufficiente (circa l'1%) di soluzione madre del prodotto in esame, in modo da ottenere nel liquame la concentrazione voluta del prodotto (circa 10-20 mg DOC/l o 40 mg COD/l). Ciò si può effettuare o miscelando giornalmente il liquame con la soluzione madre, oppure con un sistema separato di pompaggio. Detta concentrazione può essere raggiunta progressivamente. Se non si hanno effetti tossici della sostanza in esame sul fango attivo, possono essere provate anche concentrazioni più elevate.

L'unità «in bianco» è alimentata soltanto con l'affluente senza aggiunta di sostanze. Per l'analisi si prendono adeguate quantità di effluenti e si filtrano con filtri a membrana (0,45 µm) scartando i primi 20 ml (circa) di filtrato.

I campioni filtrati devono essere analizzati il giorno stesso, in caso contrario vanno opportunamente conservati, per esempio mediante l'aggiunta di 0,05 ml di una soluzione all'1% di cloruro mercurico (HgCl₂) per ogni 10 ml di campione filtrato, oppure mantenendoli alla temperatura da 2 a 4 °C per 24 ore al massimo, oppure al di sotto di - 18 °C per periodi più lunghi.

Il periodo di sperimentazione, a partire dall'aggiunta della sostanza in esame, non dovrebbe superare le sei settimane ed il periodo di valutazione dovrebbe durare almeno tre settimane; per il calcolo del risultato finale dovrebbero potersi effettuare da 14 a 20 determinazioni.

Processo a unità accoppiate

L'accoppiamento delle unità si ottiene scambiando, una volta al giorno, fra le due unità, 1,5 litri di soluzione chiarificata (fango incluso) proveniente dalle vasche di aerazione del fango attivo. Nel caso di prodotti in esame fortemente assorbenti, si prelevano dalle vasche di sedimentazione 1,5 litri del solo liquido surnatante e si versano nella vasca di fango attivo dell'altra unità.

1.6.2.3. Analisi

Per seguire il comportamento della sostanza si possono effettuare due tipi di analisi:

— DOC e COD:

le concentrazioni di DOC sono determinate in doppio con l'analizzatore di carbonio e quelle di COD (assieme o in alternativa) col sistema indicato nel riferimento bibliografico (2);

— analisi specifica:

le concentrazioni della sostanza esaminata si determinano con un metodo analitico idoneo. Se possibile, si dovrebbe effettuare una determinazione specifica della sostanza assorbita sul fango.

2. DATI E VALUTAZIONE

2.1. Processo ad unità accoppiate

Quando si impiega il «processo ad unità accoppiate», il grado giornaliero di rimozione DR viene calcolato come indicato al punto 1.2.1. Il valore DR viene quindi corretto in DR_c, per tener conto del trasferimento di sostanza dovuto al procedimento di transinoculazione, mediante l'equazione (2) e l'equazione (3) per tempi medi di ritenzione rispettivamente di tre e di sei ore.

$$DR_c = \frac{8}{7} DR - \frac{100}{7} \quad [2]$$

$$DR_c = \frac{4}{3} DR - \frac{100}{3} \quad [3]$$

Si calcola la media della serie di valori di DR_c ed inoltre la deviazione standard con l'equazione [4]

$$S_{DR_c} = \sqrt{\frac{\sum_{i=1}^n (\overline{DR_c} - DR_{ci})^2}{n-1}} \quad [4]$$

dove:

S_{DR_c} = deviazione standard della serie di valori di DR_c

$\overline{DR_c}$ = media dei valori di DR_c

n = numero di determinazioni

Si eliminano i valori anomali della serie di DR_c secondo un opportuno procedimento statistico, ad esempio Nalimov (6), con un livello di probabilità del 95 % e si ricalcolano la media e la deviazione standard della serie di DR_c priva di valori anomali (outliers).

Si calcola quindi il risultato finale con l'equazione (5):

$$DR_c = \overline{DR_c} \pm \frac{t_{n-1, \alpha}}{\sqrt{n}} S_{DR_c} \quad [5]$$

dove:

$t_{n-1, \alpha}$ = valore tabulato di t per n coppie di valori di E ed E_0 e l'intervallo fiduciario P ($P = 1 - \alpha$) è stimato al 95 % (1)

Il risultato viene espresso come media con limiti di tolleranza al 95 %, relativa deviazione standard e numero di dati della serie DR_c priva di «outliers» e numero di valori anomali, ad esempio:

$DR_c = 98,6 \pm 2,3$ % della rimozione del DOC

$s = 4,65$ % della rimozione del DOC

$n = 18$

x = numero degli «outliers»

2.2. Processo ad unità non accoppiate

Il funzionamento delle unità può essere verificato come segue:

$$\text{percentuale di rimozione del COD o del DOC} = \frac{\text{COD o DOC del liquame} - \text{COD o DOC dell'effluente}}{\text{COD o DOC del liquame}} \times 100$$

Questa rimozione giornaliera può essere riportata in grafico per evidenziare eventuali andamenti, per esempio, verso l'acclimatazione.

2.2.1. Determinazioni attraverso il COD/DOC

Il grado giornaliero di rimozione DR è calcolato come indicato al punto 1.2.1.

Si calcola la media della serie di valori DR ed inoltre la sua deviazione standard con l'equazione:

$$S_{DR} = \sqrt{\frac{\sum_{i=1}^n (\overline{DR} - DR_i)^2}{n-1}} \quad [6]$$

dove:

S_{DR} = deviazione standard della serie di valori di DR ,

\overline{DR} = media dei valori DR_i ,

n = numero delle determinazioni

Si eliminano gli «outliers» della serie di DR secondo un opportuno procedimento statistico, ad esempio Nalimov (6), con un livello di probabilità del 95 % e si ricalcolano la media e la deviazione standard della serie di DR così epurata.

Il risultato finale è quindi calcolato con l'equazione:

$$DR = \overline{DR} \pm \frac{t_{n-1;\alpha}}{\sqrt{n}} S_{DR} \quad (7)$$

dove:

$t_{n-1;\alpha}$ = valore tabulato di t per n coppie di valori di E ed E_0 e l'intervallo fiduciario P ($P = 1 - \alpha$) dove P è stimato al 95 % (1)

Come risultato vengono presi la media, con limiti di tolleranza ad un livello di probabilità del 95 %, la relativa deviazione standard, il numero di dati della serie DR epurata ed il numero di valore anomali, ad esempio:

DR = (98,6 ± 2,3 %) della rimozione del DOC

s = 4,65 % della rimozione del DOC

n = 18

x = numero di «outliers»

2.2.2. Determinazione attraverso l'analisi specifica

La percentuale di eliminazione della sostanza in esame dalla fase acquosa (R_w) è calcolata come indicato al punto 1.2.2.

3. RELAZIONE

3.1. Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- la scheda fornita nell'allegato III, che mostra le condizioni operative del saggio,
- l'apparecchiatura scelta (prova di conferma OCSE o vaso poroso),
- il procedimento scelto: unità accoppiate o meno,
- il liquame impiegato: sintetico o domestico (nel caso di liquame domestico, data e provenienza del campione),
- tipo di inoculo, con data e provenienza del campione,
- una descrizione del metodo analitico, se sono state effettuate analisi specifiche,
- grafico della rimozione di COD o DOC in funzione del tempo, comprensivo dei periodi di avviamento e di valutazione,
- recupero analitico della sostanza in esame come COD o DOC nella soluzione madre,
- nel caso siano state effettuate analisi specifiche, grafico della rimozione percentuale della sostanza esaminata dalla fase acquosa in funzione del tempo (periodo di avviamento e di valutazione),
- la rimozione media di DOC, COD o della sostanza in esame e la deviazione standard sono calcolate dai risultati del periodo di valutazione, cioè quando si ha una rimozione stazionaria della sostanza in esame o un periodo di funzionamento a regime,
- grafico della concentrazione del fango attivo in funzione del tempo,
- osservazioni riguardanti il fango attivo (scarto di fanghi in eccesso, presenza di rigonfiamenti, $FeCl_3$, ecc.),
- concentrazione della sostanza usata nel saggio,
- tutti i risultati relativi all'analisi fatta sul fango,
- tutti i dati ed i risultati sperimentali relativi alla sostanza in esame e a quella di riferimento, se impiegata,
- motivazioni scientifiche per eventuali modifiche nel procedimento.

32

Interpretazione dei risultati

Una bassa rimozione della sostanza esaminata dalla fase acquosa può essere dovuta all'inibizione dei microorganismi da parte della sostanza in esame. Ciò può anche essere evidenziato da lisi e perdita di fango, che produce un surnatante torbido e da un abbassamento dell'efficienza di rimozione COD (o DOC) dell'impianto pilota.

A volte può svolgere un ruolo l'assorbimento fisico-chimico. Le differenze fra l'azione biologica sulla molecola e l'assorbimento chimico-fisico possono essere rivelati da un'analisi condotta sul fango dopo un adeguato desorbimento.

Se si deve fare la distinzione fra biodegradazione (o parziale biodegradazione) ed assorbimento, sono necessarie ulteriori prove. Ciò si può effettuare in diversi modi, ma il più convincente è usare il surnatante come inoculo in un saggio del dossier di base (preferibilmente un saggio respirometrico).

Se si osservano elevate rimozioni DOC o COD, ciò è dovuto alla biodegradazione, mentre a basse rimozioni la biodegradazione non si può distinguere dall'eliminazione. Ad esempio, se un composto solubile manifesta una elevata costante di assorbimento del 98 % ed il tasso di eliminazione giornaliero del surplus di fango è del 10 %, è possibile un'eliminazione sino al 40 %; con un tasso di eliminazione del surplus di fango del 30 %, l'eliminazione dovuta all'assorbimento ed alla rimozione attraverso il surplus di fango può arrivare fino al 65 % (4).

Quando si effettuano analisi specifiche, occorrerebbe fare attenzione alla relazione fra la struttura della sostanza e l'analisi specifica impiegata. In questo caso il fenomeno osservato non può essere interpretato come una mineralizzazione della sostanza.

C.11. BIODEGRADAZIONE

FANGHI ATTIVI: SAGGIO DI INIBIZIONE DELLA RESPIRAZIONE

1. METODO

1.1. Introduzione

Con il metodo qui descritto si valuta l'effetto della sostanza in esame sui microorganismi misurando la velocità di respirazione in determinate condizioni alla presenza di diverse concentrazioni della sostanza stessa.

Il metodo ha lo scopo di fornire un procedimento rapido di «screening» per l'identificazione delle sostanze che possono avere effetti nocivi sugli impianti di trattamento batterico aerobio e per indicare le concentrazioni della sostanza in esame, che non provocano effetti inibitori, da usare nei saggi di biodegradabilità.

Si può fare precedere la prova definitiva da una prova orientativa che consenta di avere delle informazioni sull'intervallo di concentrazioni da usare nel saggio.

Nel programma del saggio vengono inclusi due controlli senza la sostanza da esaminare, da utilizzare uno all'inizio e l'altro alla fine della serie di saggi. Ciascun gruppo di fanghi attivi dovrebbe essere anche controllato con una sostanza di riferimento.

Il presente metodo si applica più facilmente a quelle sostanze che grazie alla loro idrosolubilità ed alla loro bassa volatilità, permangono prevalentemente in acqua.

Per le sostanze che hanno invece una limitata solubilità nei mezzi di trattamento, può non essere possibile determinare la EC_{50} .

Quando la sostanza in esame ha tendenza a disaccoppiare la fosforilazione ossidativa, i risultati basati sull'assunzione di ossigeno possono condurre ad errate conclusioni.

Per eseguire il saggio è utile disporre delle seguenti informazioni:

- idrosolubilità,
- tensione di vapore,
- formula di struttura,
- grado di purezza della sostanza in esame.

Raccomandazione:

I fanghi attivi possono contenere organismi potenzialmente patogeni e dovrebbero perciò essere maneggiati con cautela.

1.2. Definizioni e unità

La velocità di respirazione è il consumo di ossigeno da parte di microorganismi del fango aerobio di acque reflue ed è espresso generalmente in mg di O_2 per mg di fango per ora.

Per calcolare l'effetto inibitorio della sostanza in esame ad una data concentrazione, la velocità di respirazione si esprime come percentuale della media delle velocità di respirazione dei due controlli:

$$\left(1 - \frac{2 R_s}{R_{C_1} + R_{C_2}}\right) \times 100 = \text{percentuale di inibizione}$$

dove:

R_s = velocità di consumo di ossigeno alla concentrazione saggiata della sostanza in esame

R_{C_1} = velocità di consumo di ossigeno nel controllo 1,

R_{C_2} = velocità di consumo di ossigeno nel controllo 2.

EC_{50} è, in questo metodo, la concentrazione della sostanza in esame alla quale la velocità di respirazione risulta pari al 50 % di quella rilevata nel controllo nelle condizioni qui descritte.

1.3. Sostanze di riferimento

Per controllare che la sensibilità del fango sia normale si raccomanda di usare come sostanza di riferimento il 3,5-diclorofenolo, noto come inibitore della respirazione, e di sottoporlo a determinazione della EC_{50} in ciascun gruppo di fanghi attivi.

1.4. Principio del metodo

La velocità di respirazione di un fango attivo, alimentato con una quantità standard di liquame sintetico, è misurato dopo un tempo di contatto di 30 minuti o/e di 3 ore. Si misura anche la velocità di respirazione dello stesso fango attivo in presenza di diverse concentrazioni della sostanza in esame in condizioni per il resto identiche. L'effetto inibitorio della sostanza in esame ad una data concentrazione è espresso come percentuale delle velocità medie di respirazione dei due controlli. Dalle determinazioni a diverse concentrazioni si calcola un valore della EC_{50} .

1.5. Criteri di qualità

I risultati del saggio sono validi se:

- la velocità di respirazione dei controlli differiscono entro il 15 %;
- la EC_{50} (30 minuti e/o 3 ore) del 3,5-diclorofenolo cade nell'intervallo accettato compreso fra 5 e 30 mg/l.

1.6. Descrizione del metodo**1.6.1. Reagenti****1.6.1.1. Soluzioni della sostanza in esame**

Le soluzioni della sostanza in esame vengono preparate all'inizio dello studio impiegando una soluzione madre. Se si segue il procedimento di cui sotto, è opportuno che la concentrazione della soluzione madre sia di 0,5 g/l.

1.6.1.2. Soluzione della sostanza di riferimento

Si può preparare ad esempio una soluzione di 3,5-diclorofenolo sciogliendone 0,5 g in 10 ml di NaOH 1M, diluendo quindi con acqua distillata sino a circa 30 ml, aggiungendo (mentre si agita) H_2SO_4 0,5M sino al punto di precipitazione incipiente — occorreranno circa 8 ml di H_2SO_4 0,5M — e diluendo infine la miscela con acqua distillata sino al volume di 1 litro. Il pH dovrebbe allora avere un valore compreso fra 7 e 8.

1.6.1.3. Liquame sintetico

Una alimentazione di liquame sintetico si ottiene sciogliendo in un litro di acqua le seguenti sostanze nelle quantità precisate:

- 16 g di peptone,
- 11 g di estratto di carne,
- 3 g di urea,
- 0,7 g di NaCl,
- 0,4 g di $CaCl_2 \cdot 2H_2O$,
- 0,2 g di $MgSO_4 \cdot 7H_2O$,
- 2,8 g di K_2HPO_4 .

Nota 1: Questo liquame sintetico è 100 volte più concentrato di quello descritto in OECD Technical Report, «Metodo proposto per la determinazione della biodegradabilità dei tensioattivi impiegati nei detersivi sintetici» (11 giugno 1976), con l'aggiunta di fosfato acido di potassio.

Nota 2: La soluzione preparata, se non viene utilizzata subito, dovrà essere conservata al buio a temperature comprese tra 0 °C e 4 °C per non oltre una settimana, in condizioni tali da non subire alterazioni nella composizione. Inoltre, prima della conservazione la soluzione potrà essere sterilizzata oppure si potranno aggiungere il peptone e l'estratto di carne solo poco prima di effettuare l'analisi. Prima dell'uso la soluzione dovrà essere agitata ed il suo pH dovrà essere corretto.

1.6.2. Apparecchiatura

Apparecchiatura di misurazione: non è importante che l'apparecchio abbia una forma precisa. Comunque, la bottiglia di misurazione dovrebbe essere completamente piena e la sonda dovrebbe aderire ermeticamente al collo.

È necessaria la normale dotazione di laboratorio ed in particolare:

- apparecchio di misurazione,
- sistema di aerazione,
- elettrodo per pH e relativa apparecchiatura di misurazione,
- elettrodo ad ossigeno.

1.6.3. Preparazione dell'inoculo

Come inoculo batterico per il saggio si impiega fango attivo proveniente da un impianto di trattamento di liquami prevalentemente domestici.

Se necessario, al ritorno in laboratorio, si possono rimuovere le particelle grossolane mediante sedimentazione per un breve periodo ad esempio per 15 minuti, e, quindi, decantare, per l'uso, lo strato superficiale contenente le particelle solide più piccole. In alternativa il fango può essere miscelato per pochi secondi con un agitatore.

Inoltre, ove si presume la presenza di materiali inibenti, il fango dovrebbe essere lavato con acqua di rubinetto o con soluzione isotonica. Dopo centrifugazione si decanta il surnatante (questo procedimento si ripete per tre volte).

Una piccola quantità di fango umido viene pesata, essiccata e ripesata. In questo modo si può calcolare la quantità di fango umido da sospendere in acqua per ottenere un fango attivo con una quantità di solidi sospesi nel liquido chiarificato compresa tra 2 e 4 gr/l. Questa quantità dà una concentrazione compresa tra 0,8 e 1,6 g/l nel mezzo utilizzato per il saggio, se si segue la procedura raccomandata più sotto.

Se il fango non può essere utilizzato il giorno stesso del prelievo, ad ogni litro del fango attivo preparato come sopra si aggiungono 50 ml di liquame sintetico; il fango viene quindi aerato per tutta la notte a 20 °C (± 2 °C). L'aerazione viene mantenuta anche durante la giornata in attesa dell'uso prima del quale si controlla e, se necessario, si tampona il pH fra 6 e 8. I solidi sospesi nel liquido chiarificato si dovrebbero determinare come descritto nel precedente paragrafo.

Se si deve impiegare lo stesso gruppo di fanghi nei giorni successivi (quattro giorni al massimo), alla fine di ogni giornata di lavoro occorrerà aggiungere altri 50 ml di liquame sintetico, per litro di fango.

1.6.4. Esecuzione del saggio

Durata/tempo di contatto:	30 minuti e/o 3 ore, sotto aerazione;
Acqua:	acqua potabile (se necessario dechlorata);
Alimentazione di aria:	aria pulita, esente da oli; flusso da 0,5 a 1 l/min;
Apparecchiatura di misurazione:	bottiglia a fondo piatto del tipo della bottiglia per la determinazione del BOD;
Ossimetro:	idoneo elettrodo ad ossigeno con registratore;
Soluzione nutritiva:	liquame sintetico (vedi sopra);
Sostanza in esame:	la soluzione in esame è preparata in concomitanza all'inizio del saggio;
Sostanza di riferimento:	ad esempio 3,5-diclorofenolo (almeno tre concentrazioni);
Controlli:	campioni inoculati esenti dalla sostanza in esame;
Temperatura:	20 °C (± 2 °C).

Si descrive in seguito un procedimento sperimentale che può essere seguito sia per la sostanza in esame che per quella di riferimento durante il periodo di contatto di tre ore.

Occorrono diversi recipienti (ad esempio becher da 1 litro). Si dovrebbe impiegare una serie di almeno cinque concentrazioni che differiscano tra di loro di un fattore costante di preferenza non superiore a 3,2.

Al tempo «0», si portano 16 ml di liquame sintetico a 300 ml con acqua. Si aggiungono 200 ml di inoculo batterico e si versa la miscela totale (500 ml) in un primo recipiente (primo controllo C_1).

I recipienti in esame dovrebbero essere aerati continuativamente in modo da impedire che il livello di O_2 disciolto scenda al di sotto di 2,5 ml/l ed in modo che, subito prima di misurare la velocità di respirazione, la concentrazione di O_2 sia almeno uguale a 6,5 mg/l.

Al tempo «15 minuti» (15 minuti è un intervallo arbitrario ma adeguato) si ripete la stessa operazione salvo che 100 ml della soluzione madre della sostanza in esame vengono aggiunti ai 16 ml di liquame sintetico prima di addizionare l'acqua sino a 300 ml e l'inoculo batterico sino al volume di 500 ml. Questa miscela viene quindi versata in un secondo recipiente ed aerata come sopra. Si ripete questo procedimento ad intervalli di 15 minuti con differenti volumi della soluzione madre della sostanza in esame, in modo da disporre di una serie di recipienti contenenti diverse concentrazioni della sostanza in esame. Infine si prepara un secondo controllo (C_2).

Dopo tre ore si determina il pH e si versa un'aliquota ben miscelata del contenuto del primo recipiente nell'apparecchio di misurazione e si misura la velocità di respirazione per un tempo fino a 10 minuti.

Questa determinazione viene ripetuta sul contenuto di ciascun recipiente ad intervalli di 15 minuti, in modo che il tempo di contatto per ogni recipiente sia di tre ore.

La sostanza di riferimento viene saggiata nello stesso modo su ciascun gruppo di inoculi batterici.

Quando si devono effettuare misurazioni dopo 30 minuti di contatto, occorre un procedimento diverso (ad esempio con più di un ossimetro).

Se si richiede la misura del consumo di ossigeno, si preparano altre bottiglie contenenti la sostanza in esame, il liquame sintetico ed acqua ma non fango attivo.

Il consumo di ossigeno si misura e registra dopo un periodo di aerazione di 30 minuti e/o 3 ore (tempo di contatto).

2. DATI E VALUTAZIONE

La velocità di respirazione si calcola dal tracciato del registratore nell'intervallo che va da circa 2,5 a 6,5 mg O₂/l, oppure, se la velocità di respirazione è bassa, per un periodo di 10 minuti. Il tratto di curva di respirazione in cui si misura la velocità di respirazione dovrebbe essere lineare.

Se le velocità di respirazione dei due controlli differiscono tra loro di più del 15% o se la EC₅₀ (30 minuti e/o 3 ore) della sostanza di riferimento non cade nell'intervallo ammesso (da 5 a 30 mg/l per il 3,5-diclorofenolo), la prova non è valida e deve essere ripetuta.

Per ogni concentrazione in esame si calcola la percentuale di inibizione (vedi paragrafo 1.2). Quest'ultima viene riportata in grafico, su carta lognormale (o logprobit), in funzione della concentrazione e si ricava un valore di EC₅₀.

Usando procedimenti standard si possono determinare i limiti di confidenza al 95% per i valori della EC₅₀.

3. RELAZIONE

3.1. Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- Sostanza in esame: dati di identificazione chimica.
- Sistema di saggio: origine, concentrazione ed eventuali trattamenti preliminari del fango attivo.
- Condizioni del saggio:
 - pH della miscela in esame prima di determinare la respirazione;
 - temperatura;
 - durata;
 - sostanza di riferimento e relativa EC₅₀ misurata;
 - eventuale assunzione abiotica di ossigeno.
- Risultati:
 - tutti i dati misurati;
 - curva di inibizione e metodo per il calcolo della EC₅₀.
 - EC₅₀ e, se possibile, limiti di confidenza al 95%, EC₂₀ ed EC₈₀.
 - tutte le osservazioni e le eventuali deviazioni dal presente metodo che potrebbero aver condizionato il risultato.

3.2. Interpretazione dei dati

Dal momento che le complesse interazioni che si hanno nell'ambiente non possono essere fedelmente riprodotte in un saggio di laboratorio, il valore della EC₅₀ dovrebbe essere considerato semplicemente come una indicazione della probabile tossicità della sostanza in esame per il fango attivo usato nel trattamento dei liquami o per i microorganismi delle acque reflue.

Inoltre, le sostanze in esame aventi effetto inibitorio sull'ossidazione dell'ammoniaca possono anche causare curve di inibizione atipiche. Di conseguenza tali curve dovranno essere interpretate con cautela.

C.12. BIODEGRADAZIONE

SAGGIO SCAS MODIFICATO

1. METODO

1.1. Introduzione

Scopo del metodo è quello di valutare la potenziale biodegradabilità ultima di sostanze organiche solubili in acqua e non volatili, esposte per un lungo periodo a concentrazioni relativamente elevate di microorganismi. La vitalità dei microorganismi viene mantenuta per tutto il periodo aggiungendo giornalmente liquami decantati. (Per l'intervallo di fine settimana, i liquami possono essere conservati a 4 °C. In alternativa si può usare il liquame sintetico del saggio di conferma OCSE.)

Nell'interpretazione dei risultati occorre tenere conto dell'eventuale assorbimento fisico-chimico della sostanza in esame sui solidi in sospensione (vedi paragrafo 3.2).

A causa del lungo periodo di ritenzione della fase liquida (36 ore) e dell'aggiunta, intermittente di nutrienti, la prova non riproduce le stesse condizioni che si hanno in un impianto per il trattamento dei liquami. I risultati ottenuti con diverse sostanze indicano che il sistema ha un elevato potenziale di biodegradazione.

Le condizioni sperimentali sono estremamente favorevoli alla selezione e/o all'adattamento di microorganismi capaci di degradare il composto in esame (si può seguire questo procedimento anche per produrre inoculi acclimatati da utilizzare in altri saggi).

Nel presente metodo la biodegradabilità ultima delle sostanze in esame viene determinata attraverso la misura della concentrazione del carbonio organico disciolto (DOC) (è preferibile determinare il DOC dopo acidificazione e deaerazione anziché dalla differenza $C_{\text{total}} - C_{\text{inorganico}}$).

L'impiego simultaneo di un metodo analitico specifico consente di determinare la degradazione primaria della sostanza (modifica della struttura chimica della sostanza in esame).

Il metodo può essere applicato soltanto alle sostanze organiche che alle concentrazioni impiegate per il saggio:

- sono solubili in acqua (almeno 20 mg/l di carbonio organico disciolto),
- hanno una tensione di vapore trascurabile,
- non esercitano effetti inibitori sui batteri,
- non vengono assorbite in modo significativo dal sistema sperimentale,
- non vengono sottratte alla soluzione in esame mediante formazione di schiume.

Occorre determinare il contenuto di carbonio organico della sostanza in esame.

Per l'interpretazione dei risultati ottenuti, in particolare nei casi in cui i valori siano bassi o trascurabili, sarà utile disporre di informazioni sulle proporzioni relative dei principali componenti della sostanza in esame.

Per l'interpretazione di eventuali valori bassi e per la scelta di una concentrazione adeguata al saggio, può essere utile disporre di informazioni sulla tossicità della sostanza per i microorganismi.

1.2. Definizioni e unità

C_T = concentrazione della sostanza in esame espressa come carbonio organico presente o addizionato al liquame sedimentato all'inizio del periodo di aerazione (mg/l)

C_r = concentrazione del carbonio organico disciolto rinvenuto nel surnatante del saggio alla fine del periodo di aerazione (mg/l)

C_c = concentrazione del carbonio organico disciolto rinvenuto nel surnatante del controllo alla fine del periodo di aerazione (mg/l)

Nel presente metodo la biodegradazione è definita come eliminazione del carbonio organico. La biodegradazione può essere espressa come:

1) la rimozione percentuale D_{da} della sostanza aggiunta giornalmente.

$$D_{da} = \frac{C_T - (C_i - C_c)}{C_T} \times 100 \quad [1]$$

dove

D_{da} = degradazione/aggiunta giornaliera.

2) la rimozione percentuale D_{sd} di sostanza rispetto a quella presente all'inizio di ogni giorno

$$D_{sd} = \frac{2C_T + C_n - C_c - 3C_{i(i+1)} + 3C_{c(i+1)}}{2C_T + C_n - C_c} \times 100 \quad [2 a)]$$

$$\approx \frac{2C_T - 2C(C_c - C_c)}{2C_T + (C_i - C_c)} \times 100 \quad [2 b)]$$

dove:

D_{sd} = degradazione/sostanza iniziale giornaliera

Gli indici i e $(i + 1)$ si riferiscono al giorno in cui si effettua la misurazione. L'equazione (2 a) è consigliata se il DOC dell'effluente varia giornalmente mentre l'equazione (2 b) può essere usata quando il DOC dell'effluente rimane relativamente costante da un giorno all'altro.

1.3 Sostanze di riferimento

In alcuni casi quando si esamina una nuova sostanza, possono essere utili delle sostanze di riferimento; ciò nonostante non si propogano qui sostanze di riferimento specifiche.

Nell'allegato I vengono forniti dati relativi a numerosi composti analizzati in un saggio interlaboratorio soprattutto per consentire di tanto in tanto la calibrazione del metodo e per rendere possibile il confronto dei risultati quando se ne adotta un altro.

1.4 Principio del metodo

I fanghi attivi provenienti da un impianto di trattamento dei liquami vengono posti in una unità semicontinua per fanghi attivi (SCAS). Si aggiungono il composto in esame e liquame domestico sedimentato; si effettua l'aerazione della miscela per 23 ore. Quindi si interrompe l'aerazione, si lasciano decantare i fanghi e si rimuove il surnatante.

I fanghi che rimangono nella camera di aerazione vengono quindi mescolati con un'altra aliquota del composto in esame e del liquame, e si ripete il ciclo.

La biodegradazione si ricava determinando la quantità di carbonio organico disciolto nel surnatante. Tale valore viene confrontato con quello trovato nel surnatante del controllo contenente soltanto liquame decantato.

Se si utilizza un metodo analitico specifico si possono determinare le variazioni di concentrazione della sostanza in esame dovute alla biodegradazione (biodegradabilità primaria).

1.5 Criteri di qualità

La riproducibilità di questo metodo basato sulla rimozione di carbonio organico disciolto non è stata ancora dimostrata. (Se si prende in considerazione la biodegradazione primaria si ottengono dati molto precisi per sostanze che siano estesamente degradate.)

La sensibilità del metodo dipende soprattutto dalla variabilità del bianco ed in minor misura dalla precisione della determinazione del carbonio organico disciolto e dalla quantità del composto in esame presente nel liquido all'inizio di ogni ciclo.

1.6 Descrizione del metodo

1.6.1 Preparazioni

Per ciascuna sostanza in esame e per i controlli si collega un numero sufficiente di unità di aerazione pulite (in alternativa si può usare l'unità originale per il saggio SCAS da 1,5 litri) con i tubi di presa dell'aria (figura 1). L'aria compressa inviata nelle unità di saggio, purificata con un filtro di cotone grezzo, deve essere esente da carbonio organico e satura di acqua per ridurre le perdite per evaporazione.

Da un impianto di trattamento a fanghi attivi adibito prevalentemente a liquami domestici si preleva un campione di liquido chiarificato, contenente da 1 a 4 g/l di solidi sospesi. Per ciascuna unità di aerazione occorrono circa 150 ml di liquido chiarificato.

Si preparano con acqua distillata le soluzioni madri della sostanza in esame, di solito è richiesta una concentrazione di 400 mg/l di carbonio organico che, se non ha luogo biodegradazione, corrisponde ad una concentrazione di sostanza in esame pari a 20 mg/l di carbonio all'inizio di ogni ciclo di aerazione.

Se la tossicità per i microorganismi lo consente si possono avere concentrazioni più elevate. Si misura la concentrazione di carbonio organico nelle soluzioni madri.

1.6.2. Condizioni del saggio

Il saggio va effettuato da 20 a 25 °C. Si utilizza un'elevata concentrazione di microorganismi aerobici (da 1 a 4 g/l di solidi sospesi) ed il periodo di ritenzione effettivo è di 36 ore. In genere, otto ore dopo l'avvio di ciascun ciclo di aerazione, il carbonio organico contenuto nei liquami immessi è ampiamente ossidato. Dopo ha inizio la respirazione endogena del fango che si manterrà per tutto il rimanente periodo di aerazione, durante il quale il solo substrato disponibile è la sostanza in esame a meno che non venga anch'essa metabolizzata rapidamente. Questi fattori, unitamente alla reinoculazione giornaliera del sistema (vedi paragrafo 1.4), nel caso in cui si usino come mezzo liquami domestici, crea condizioni estremamente favorevoli sia per l'acclimatazione, sia per ottenere elevati valori di biodegradazione.

1.6.3. Esecuzione del saggio

Si preleva un campione del liquido chiarificato da un idoneo impianto a fanghi attivi per il trattamento di liquami in prevalenza domestici oppure da un impianto di laboratorio e si mantiene in condizioni aerobiche sino all'impiego in laboratorio. Si riempie ciascuna unità di aerazione e l'unità di controllo con 150 ml (se si utilizza l'unità originale per il saggio SCAS, moltiplicare i volumi per 10) di liquido chiarificato e si avvia l'aerazione. Dopo 23 ore si interrompe l'aerazione e si lasciano decantare i fanghi per 45 minuti. Si apre, a turno, il rubinetto di ogni recipiente e si prelevano aliquote da 100 ml di surnatante. Si prepara, immediatamente prima dell'impiego, un campione di liquami domestici decantati e se ne aggiungono 100 ml al fango che rimane in ciascuna unità di aerazione. Si avvia nuovamente l'aerazione. A questo punto non si aggiunge la sostanza da esaminare e si alimentano giornalmente le unità con liquami domestici fino a quando si forma per decantazione un surnatante chiaro. In genere questa fase richiede al massimo due settimane e nel frattempo il carbonio organico disciolto nel surnatante raggiunge alla fine di ogni ciclo di aerazione un valore costante.

Terminata questa fase, i singoli fanghi sedimentati vengono mescolati tra loro e 50 ml di tale miscela vengono introdotti in ciascuna unità.

95 ml di liquame sedimentato e 5 ml di acqua vengono aggiunti all'unità di controllo, e 95 ml di liquame sedimentato più 5 ml della soluzione madre della sostanza in esame (400 mg/l) vengono aggiunti alle unità di saggio. Si riavvia l'aerazione e si protrae per 23 ore. Si lasciano quindi sedimentare i fanghi per 45 minuti, si preleva il surnatante e se ne analizza il contenuto di carbonio organico disciolto.

Le suddette operazioni di riempimento e di prelievo, vengono ripetute ogni giorno per tutta la durata del saggio.

Prima della sedimentazione può essere necessario pulire le pareti delle unità per evitare che si accumulino solidi al di sopra del livello del liquido. Per evitare contaminazioni incrociate si utilizza un raschiatore o una spazzola diversa per ciascuna unità.

Idealmente, il carbonio organico disciolto nei surnatanti dovrebbe essere determinato ogni giorno anche se si può consentire una minore frequenza delle analisi. Prima delle analisi i liquidi vengono filtrati mediante filtri a membrana con pori da 0,45 µm lavati oppure vengono centrifugati. I filtri a membrana sono idonei se durante la filtrazione non liberano carbonio organico né assorbono la sostanza in esame. Nella centrifuga la temperatura del campione non deve superare i 40 gradi centigradi.

La durata del saggio per i composti che mostrano una biodegradazione limitata o nulla non è fissata, ma l'esperienza suggerisce che la durata dovrebbe essere, in generale, di almeno 12 settimane, ma non più lunga di 26 settimane.

2. DATI E VALUTAZIONE

I valori del carbonio organico disciolto rilevati nei surnatanti delle unità di saggio e delle unità di controllo vengono riportati in grafico in funzione del tempo.

Con il procedere della biodegradazione i valori determinati nel saggio si avvicinano a quelli del controllo. Quando la differenza tra i due livelli si mantiene costante per oltre tre misurazioni consecutive, si esegue un numero di ulteriori misurazioni, tale da effettuare una elaborazione statistica dei dati e da calcolare la biodegradazione percentuale subita dalla sostanza in esame (D_{d} , oppure $D_{\text{u,d}}$, vedi paragrafo 1.2).

3. RELAZIONE

3.1 Relazione sul saggio

Nella relazione sul saggio devono figurare, se possibile:

- tutte le informazioni sul tipo di liquame, sul tipo di unità usata e sui risultati sperimentali concernenti le sostanze esaminate, la sostanza di riferimento, se usata, ed il bianco,
- la temperatura,
- la curva di rimozione, nonché descrizione e metodo di calcolo relativi (vedi paragrafo 1.2),
- date e luogo di prelievo dei fanghi attivi e del liquame, stato di adattamento, concentrazione, ecc.,
- motivazioni scientifiche di eventuali modifiche del procedimento,
- firma e data.

3.2 Interpretazioni dei risultati

Dato che le sostanze esaminate con il presente metodo non sono facilmente biodegradabili, qualsiasi rimozione del DOC imputabile esclusivamente alla biodegradazione avviene in genere gradualmente nel corso di giorni o settimane, ad eccezione di quei casi in cui avviene una improvvisa acclimatazione indicata da una brusca scomparsa che si verifica dopo alcune settimane.

In ogni caso l'assorbimento chimico-fisico può a volte giocare un ruolo importante; ciò si verifica quando all'inizio della prova si riscontra una parziale o completa rimozione del DOC aggiunto. Ciò che accade successivamente, dipende da fattori quali il grado di assorbimento e la concentrazione di solidi sospesi nell'effluente di scarico. Di solito la differenza tra concentrazione del DOC nel controllo e nei surnatanti del saggio aumenta gradualmente rispetto al basso valore iniziale e tale differenza si mantiene quindi al nuovo valore per il resto della prova a meno che non si verifichi l'acclimatazione.

Se si vuole distinguere nel grafico la biodegradazione (o la parziale biodegradazione) dall'assorbimento, sono necessari ulteriori saggi. Questi possono essere effettuati in diversi modi: il più convincente è quello di usare il surnatante o i fanghi come inoculo in un saggio del dossier di base (preferibilmente il saggio respirometrico).

Le sostanze che in questo saggio mostrano un'elevata rimozione del DOC, non dovuta ad assorbimento, devono essere considerate potenzialmente biodegradabili. Un'eliminazione parziale non dovuta ad assorbimento indica che la sostanza è almeno in parte biodegradabile.

Valori bassi o nulli di rimozione del DOC possono essere dovuti ad un effetto inibente della sostanza in esame sui microorganismi, il che può anche essere evidenziato da lisi o da riduzione dei fanghi con formazione di surnatanti torbidi. Il saggio deve essere ripetuto a concentrazione più bassa della sostanza in esame.

Il ricorso a un metodo analitico specifico o alla marcatura della sostanza in esame con il ^{14}C può permettere una maggiore sensibilità. Nel caso di composti marcati con ^{14}C lo sviluppo di $^{14}\text{CO}_2$ confermerà che la biodegradazione ha avuto luogo.

Quando i risultati vengono presentati anche come biodegradazione primaria occorre dare, se possibile, una spiegazione del cambiamento di struttura chimica che causa la diminuzione di risposta della sostanza in esame.

Si deve dimostrare la validità del metodo analitico e riportare la risposta fornita dal bianco.

4. BIBLIOGRAFIA

- (1) OCSE, Parigi 1981, *Linea Guida 302 B*, decisione C(81) 30 def. del Consiglio.

Appendice 1

Saggio SCAS: Esempio di risultati

Sostanza	C_T (mg/l)	$C_i - C_f$ (mg/l)	Biodegrada- zione percentuale D_{40}	Durata del saggio (giorni)
4-acetil aminobenzen sulfonato	17,2	2,0	85	40
Tetrapropilene benzen sulfonato	17,3	8,4	51,4	40
4-nitrofenolo	16,9	0,8	95,3	40

1. INTRODUZIONE GENERALE

1.1 L'obiettivo della classificazione è l'identificazione di tutte le proprietà fisico-chimiche, tossicologiche ed eco-tossicologiche delle sostanze e le proprietà tossicologiche e fisico-chimiche dei preparati che possono comportare dei rischi all'atto della normale manipolazione o utilizzazione. Dopo l'identificazione delle proprietà pericolose, la sostanza o il preparato devono essere etichettati per indicare il pericolo o i pericoli al fine di proteggere l'utilizzatore, il pubblico e l'ambiente.

1.2 Il presente allegato presenta i criteri generali di classificazione e di etichettatura delle sostanze e dei preparati di cui all'articolo 4 del decreto legislativo 3 febbraio 1997, n. 52 e all'articolo 3 del decreto ministeriale 28 gennaio 1992, nonché ad altre normative sui preparati pericolosi. Il presente allegato è destinato a tutti gli interessati (fabbricanti, importatori, autorità nazionali) con metodi di classificazione e di etichettatura delle sostanze e dei preparati pericolosi.

1.3. Le presenti disposizioni e quelle del decreto ministeriale 28 gennaio 1992 hanno lo scopo di mettere a disposizione della popolazione e dei lavoratori informazioni essenziali sulle sostanze e sui preparati pericolosi. L'etichetta richiama l'attenzione di coloro che manipolano o utilizzano dette sostanze o preparati sui pericoli insiti in alcuni di essi. L'etichetta può inoltre richiamare l'attenzione su informazioni più complete in materia di precauzioni e di utilizzazione del prodotto, disponibili sotto altra forma.

1.4. L'etichetta tiene conto di tutti i pericoli potenziali connessi con la normale manipolazione ed utilizzazione delle sostanze e dei preparati pericolosi nella forma in cui vengono commercializzati, ma non necessariamente nelle altre possibili forme di utilizzazione finale, ad esempio allo stato diluito. I pericoli più gravi sono segnalati da simboli; questi pericoli e quelli causati da altre proprietà pericolose sono precisati in frasi standard di rischio, mentre altre frasi, relative ai consigli di prudenza, presentano le precauzioni che occorre prendere.

Nel caso delle sostanze, l'informazione è completata dalla denominazione della sostanza secondo una nomenclatura chimica riconosciuta a livello internazionale, preferibilmente quella utilizzata dallo "European Inventory of Existing Commercial Chemical Substances (EINECS)" o dalla "European List of Notified Chemical Substances (ELINCS)", dal numero CEE e da nome, indirizzo e numero di telefono del responsabile dell'immissione della sostanza sul mercato avente sede nella Comunità.

Nel caso di preparati, l'informazione è completata dalla designazione o nome commerciale del preparato, dalla denominazione chimica delle sostanze presenti nel preparato in conformità dell'articolo 7(1)(c) del decreto ministeriale 28 gennaio 1992 e dal nome, indirizzo e numero di telefono del responsabile dell'immissione sul mercato del preparato avente sede nella Comunità.

1.5 L'articolo 6 del decreto legislativo 3 febbraio 1997, n. 52 stabilisce che i fabbricanti distributori e importatori di sostanze pericolose che non figurano ancora nell'allegato I, ma che sono incluse nell'EINECS, sono obbligati ad effettuare una ricerca per conoscere i dati pertinenti ed accessibili esistenti per quanto riguarda le proprietà di tali sostanze. In base a tali informazioni essi devono imballare e provvisoriamente etichettare tali sostanze conformemente alle regole stabilite negli articoli da 19 a 22 del citato decreto legislativo ed ai criteri enunciati nell'allegato VI.

1.6 Nel caso delle sostanze i dati per la classificazione e l'etichettatura sono ottenuti come segue:

a) per le sostanze per le quali occorre fornire le informazioni specificate nell'allegato VII la maggior parte dei dati necessari per la classificazione e l'etichettatura è contenuta nel "fascicolo di base". La classificazione e l'etichettatura verranno rivedute, se necessario, quando si disporrà di nuove informazioni (allegato VIII)

b) per quanto riguarda le altre sostanze, ad esempio quelle di cui al punto 1.5 precedente) i dati necessari per la classificazione e l'etichettatura potranno ottenersi, eventualmente, da

numerose altre fonti, ad esempio risultati di precedenti prove, informazioni richieste in applicazione delle norme internazionali sui trasporti di sostanze pericolose, informazioni ricevute da opere di consultazione, da pubblicazioni specializzate, informazioni basate sull'esperienza.

Per i preparati, i dati per la classificazione e l'etichettatura sono ottenuti come segue:

- a) i dati fisico-chimici si ottengono applicando i metodi specificati nell'allegato V del decreto legislativo 3 febbraio 1997, n. 52. Per i preparati gassosi si può impiegare un metodo di calcolo delle proprietà di comburenza ed infiammabilità (vedere capitolo 9).
- b) i dati concernenti gli effetti sulla salute si ottengono:
 - applicando i metodi specificati nell'allegato V del decreto legislativo 3 febbraio 1997, n. 52 e/o applicando il metodo convenzionale di cui all'articolo 3, paragrafo 5, lettere da a) a i) del decreto ministeriale. 28 gennaio 1992;
 - per quanto concerne la valutazione degli effetti cancerogeni, mutageni e di tossicità per la riproduzione, invece, applicando il metodo convenzionale di cui all'articolo 3, paragrafo 5, lettere da a) a i) del decreto ministeriale. 28 gennaio 1992.

Nota relativa alle prove sugli animali

L'esecuzione di prove sugli animali per determinare dati sperimentali è soggetta alle disposizioni del decreto legislativo 27 gennaio 1992, n. 116.

1.7. Applicazione dei criteri guida

La classificazione deve basarsi sulle proprietà tossicologiche e fisico-chimiche delle sostanze e dei preparati, nonché sulle proprietà ecotossicologiche delle sostanze.

La classificazione delle sostanze e dei preparati è fatta sulla base dei criteri di cui ai capitoli 2-4 e inoltre, per le sostanze, di quelle di cui al capitolo 5 del presente allegato. Si devono prendere in considerazione tutti i tipi di pericolo. Ad esempio, la classificazione di cui al punto 3.2.1 non significa che si possono ignorare i punti come il 3.2.2 o il 3.2.4.

L'obiettivo della scelta del/i simbolo/i e della/e frase/i di rischio è di illustrare sull'etichetta la natura specifica dei potenziali pericoli identificati nella classificazione.

In deroga ai criteri di cui ai punti 2.2.3, 2.2.4 e 2.2.5, le sostanze e i preparati sotto forma di aerosol saranno soggetti ai criteri di infiammabilità di cui ai punti 1.8 e 2.2, lettera c) dell'allegato al decreto del Presidente della Repubblica 21 luglio 1982, n. 741.

1.7.1. Definizioni

<Sostanze>: gli elementi chimici ed i loro composti, allo stato naturale o ottenuti mediante qualsiasi procedimento di produzione, contenenti gli additivi necessari per preservare la stabilità del prodotto e le impurezze derivanti dal procedimento impiegato, esclusi i solventi che possono essere separati senza incidere sulla stabilità della sostanza e senza modificare la sua composizione.

Una sostanza può essere ben definita chimicamente (ad esempio acetone) o una miscela complessa di costituenti di varia composizione (ad esempio distillati aromatici). In quest'ultimo caso sono stati identificati alcuni costituenti.

<Preparati>: le miscele o soluzioni composte da due o più sostanze.

1.7.2. Applicazione dei criteri guida per le sostanze

I criteri guida illustrati nel presente allegato sono direttamente applicabili nel caso in cui i dati in questione siano stati ottenuti mediante metodi di prova comparabili a quelli descritti nell'allegato V. Negli altri casi i dati disponibili devono essere valutati confrontando i metodi di prova utilizzati con quelli indicati nell'allegato V e con le norme contenute nel presente allegato, in modo da determinare la classificazione e l'etichettatura.

1.7.2.1. Classificazione di sostanze contenenti impurezze o additivi o singoli costituenti

Si deve tener conto delle impurezze, degli additivi o singoli costituenti delle sostanze complesse eventualmente identificate se le concentrazioni sono:

- 0.1% per le sostanze classificate molto tossiche, tossiche, cancerogene di categoria 1 o 2, mutagene di categoria 1 o 2, tossiche per la riproduzione di categoria 1 o 2.
- 1% per le sostanze classificate nocive, corrosive, irritanti, sensibilizzanti, cancerogene di categoria 3, mutagene di categoria 3, tossiche per la riproduzione di categoria 3, a meno che nell'allegato I al decreto legislativo 3 febbraio 1997, n. 52 siano stati specificati valori più bassi.

Ad eccezione delle sostanze specificatamente elencate nell'allegato I, la classificazione in base alle proprietà fisico-chimiche e per i pericoli per la salute deve essere effettuata conformemente ai requisiti dell'articolo 3 e l'etichettatura deve corrispondere ai requisiti dell'articolo 7 del decreto ministeriale 28 gennaio 1992

La classificazione in base alle proprietà fisico-chimiche deve essere effettuata conformemente ai criteri di cui al capitolo 2; in base agli effetti sull'ambiente deve essere effettuata conformemente ai criteri del capitolo 5 del presente allegato.

Nel caso dell'amianto (650-013-00-6) questa regola generale non si applica sino a quando non sarà fissato un limite di concentrazione nell'allegato I. Le sostanze contenenti tracce di amianto devono essere classificate ed etichettate conformemente ai principi dell'articolo 6 del decreto legislativo 3 febbraio 1997, n. 52.

1.7.3. Applicazioni dei criteri guida per i preparati

I criteri guida illustrati nel presente allegato sono direttamente applicabili nel caso in cui i dati in questione siano stati ottenuti mediante metodi di prova comparabili a quelli descritti nell'allegato V, ad eccezione dei criteri di cui al capitolo 4 per i quali è possibile applicare soltanto il metodo convenzionale. Negli altri casi, i dati disponibili devono essere valutati confrontando i metodi di prova utilizzati con quelli indicati nell'allegato V e con norme contenute nel presente allegato, in modo da applicare la classificazione e l'etichettatura appropriate.

Se i pericoli per la salute sono valutati applicando il metodo tradizionale di cui all'articolo 3, paragrafo 5, del decreto ministeriale 28 gennaio 1992, i singoli limiti di concentrazione da utilizzare sono quelli stabiliti:

- nell'allegato I del decreto legislativo 3 febbraio 1997, n. 52, o

nell'allegato I del decreto ministeriale 28 gennaio 1992, qualora la sostanza o le sostanze non figurino nell'allegato I del decreto legislativo 3 febbraio 1997, n. 52 o vi figurino senza limiti di concentrazione.

Nel caso di preparati che contengano miscele di gas, la classificazione relativa agli effetti sulla salute sarà stabilita con il metodo di calcolo in base ai singoli limiti di concentrazione fissati nell'allegato I del decreto legislativo 3 febbraio 1997, n. 52 o, qualora tali limiti non figurino nell'allegato I, in base ai criteri dell'allegato I del decreto ministeriale 28 gennaio 1992

1.7.3.1. *Preparati o sostanze descritte al punto 1.7.2.1, impiegati come costituenti di altri preparati*

L'etichettatura di tali preparati deve essere conforme alle disposizioni dell'articolo 7, alle condizioni previste dall'articolo 3 del decreto ministeriale 28 gennaio 1992. In alcuni casi, tuttavia, le informazioni contenute nell'etichetta del preparato o sostanza descritta al punto 1.7.2.1, non consentono ad altri fabbricanti che desiderino utilizzare il suddetto preparato come costituente dei loro preparati, di eseguire correttamente la classificazione e l'etichettatura dei preparati stessi.

In tal caso il responsabile dell'immissione sul mercato del preparato o della sostanza descritta al punto 1.7.2.1, avente sede nella Comunità, sia questi il fabbricante, l'importatore o il distributore, fornisce, appena possibile e su richiesta giustificata tutti i dati necessari relativi alle sostanze pericolose presenti per consentire la corretta classificazione ed etichettatura del nuovo preparato. Questi dati consentono anche al responsabile dell'immissione sul mercato del nuovo preparato di conformarsi agli altri requisiti previsti dal decreto ministeriale 28 gennaio 1992.

2. CLASSIFICAZIONE IN BASE ALLE PROPRIETA' FISICO-CHIMICHE

2.1. Introduzione

I metodi di prova per la determinazione delle proprietà esplosive, comburenti e di infiammabilità indicati nell'allegato V del decreto legislativo 3 febbraio 1997, n. 52 hanno lo scopo di precisare il significato delle definizioni generali contenute nell'articolo 2, paragrafo 2, lettere da a) a c). I criteri derivano direttamente dai metodi di prova di cui all'allegato V, quando sono menzionati.

Se sono disponibili informazioni adeguate che dimostrino in pratica che le proprietà fisico-chimiche delle sostanze e dei preparati (ad eccezione dei perossidi organici) sono diverse da quelle che si rilevano dai metodi di prova di cui all'allegato V, tali sostanze e preparati dovrebbero essere classificati in funzione del pericolo che eventualmente essi presentano per coloro che manipolano le sostanze ed i preparati o per altri.

2.2. **Criteri per la classificazione, la scelta dei simboli, l'indicazione di pericolo e la scelta delle frasi di rischio**

Nel caso dei preparati è necessario prendere in considerazione i criteri di cui all'articolo 3, paragrafo 2, del decreto ministeriale 28 gennaio 1992.

2.2.1. Esplosivo

Le sostanze e i preparati saranno classificati come esplosivi e contrassegnati dal simbolo E e dall'indicazione di pericolo <esplosivo> in base ai risultati delle prove descritte nell'allegato V, e nella misura in cui le sostanze e i preparati sono esplosivi nella forma in cui sono commercializzati. E' obbligatoria una frase relativa ai rischi, da scegliere sulla base di quanto segue:

R2 Rischio di esplosione per urto, sfregamento, fuoco o altre sorgenti d'ignizione

- sostanze e preparati, esclusi quelli elencati in appresso.

R3 Elevato rischio di esplosione per urto, sfregamento, fuoco o altre sorgenti d'ignizione

- sostanze e preparati particolarmente sensibili, come i sali dell'acido picrico e la pentrite

2.2.2 Comburente

Le sostanze ed i preparati saranno classificati come comburenti e contrassegnati dal simbolo <O> e dall'indicazione di pericolo <comburente> conformemente ai risultati delle prove

R11 Facilmente infiammabile

- Sostanze e preparati che possono facilmente infiammarsi in seguito a un breve contatto con una sorgente di accensione e che continuano a bruciare o a consumarsi anche dopo l'allontanamento di tale sorgente;
- Sostanze e preparati liquidi il cui punto di infiammabilità è inferiore a 21°C ma che non sono estremamente infiammabili.

R15 A contatto con l'acqua libera gas estremamente infiammabili

- Sostanze e preparati che, a contatto con l'acqua o l'aria umida, sprigionano gas estremamente infiammabili in quantità pericolose e almeno pari a 1 l/kg/h.

R17 Spontaneamente infiammabile all'aria

- Sostanze e preparati che a contatto con l'aria, a temperatura ambiente e senza apporto di energia, possono riscaldarsi e quindi infiammarsi.

2.2.5. Infiammabile

Le sostanze e i preparati saranno classificati come infiammabili in base ai risultati delle prove menzionate nell'allegato V. La frase indicante i rischi specifici sarà assegnata tenendo conto dei criteri sottoelencati:

R10 Infiammabile

- Sostanze e preparati liquidi il cui punto di infiammabilità è uguale o superiore a 21°C e minore o uguale a 55°C.

Tuttavia, l'esperienza ha dimostrato che un preparato che ha un punto di infiammabilità maggiore o uguale a 21°C e minore o uguale a 55°C può non essere classificato come infiammabile se non può in alcun modo alimentare una combustione e nella misura in cui non sussiste motivo per temere di esporre a pericolo coloro che manipolano i preparati in questione o altre persone.

2.2.6. Altre proprietà fisico-chimiche

Ulteriori frasi di indicazione dei rischi saranno assegnate alle sostanze e ai preparati classificati in base ai principi di cui ai punti da 2.2.1 a 2.2.5 (di cui sopra) o ai capitoli 3 e 4 in appresso, conformemente ai seguenti criteri (che si basano sulle esperienze raccolte durante l'elaborazione dell'allegato I).

R1 Esplosivo allo stato secco

Per le sostanze e i preparati esplosivi immessi sul mercato in soluzione o in forma umida; ad esempio nitrocellulosa con oltre il 12,6% di azoto.

R4 Forma composti metallici esplosivi molto sensibili

Per sostanze e preparati che possono dare luogo alla formazione di sensibili derivati metallici esplosivi, ad esempio acido picrico, acido stiftico.

R5 Pericolo di esplosione per riscaldamento

Per sostanze e preparati instabili al calore non classificati come esplosivi, ad esempio acido perclorico > 50%.

R6 Esplosivo a contatto o senza contatto con l'aria

Per sostanze e preparati instabili a temperatura ambiente, ad esempio acetilene.

menzionate nell'allegato V. E' obbligatoria una frase indicante i rischi specifici, da scegliere sulla base dei risultati delle prove e tenendo conto di quanto segue:

R7 Può provocare un incendio

- perossidi organici che possono infiammarsi anche quando non sono a contatto con altri materiali combustibili

R8 Può provocare l'accensione di materie combustibili

- altre sostanze e preparati comburenti, compresi i perossidi inorganici, che possono infiammarsi o aggravare il rischio di incendio quando sono a contatto con materiali combustibili.

R9 Esplosivo in miscela con materiali combustibili

- altre sostanze e preparati, compresi i perossidi inorganici, che diventano esplosivi se miscelati con materiali combustibili, ad esempio alcuni clorati.

2.2.2.1. Osservazioni concernenti i perossidi organici

Gli attuali metodi di cui all'allegato V non possono essere applicati ai perossidi organici per le proprietà comburenti.

Per le sostanze, i perossidi organici sono classificati come comburenti in base alla loro struttura (ad es. R-O-O-H; R1-O-O-R2).

I preparati sono classificati usando il metodo di calcolo basato sulla presenza dell'ossigeno attivo di cui al punto 9.3.

Ogni preparato contenente perossido organico è pertanto classificato come comburente se contiene:

- più del 5% di perossidi organici o
- più dello 0,5% di ossigeno disponibile dai perossidi organici e non più del 5% di perossido idrogeno.

2.2.3. Estremamente infiammabile

Le sostanze e i preparati saranno classificati come estremamente infiammabili e contrassegnati dal simbolo F+ e dall'indicazione di pericolo <estremamente infiammabile> in funzione dei risultati delle prove previste dall'allegato V. La frase indicante i rischi specifici viene assegnata in base ai seguenti criteri:

R12 Estremamente infiammabili

- sostanze e preparati liquidi che hanno un punto di infiammabilità inferiore a 0°C e un punto di ebollizione (o, nel caso di un intervallo di ebollizione, il punto iniziale di ebollizione) inferiore o uguale a 35°C.
- sostanze e preparati gassosi che a temperatura e pressione ambiente si infiammano a contatto con l'aria.

2.2.4. Facilmente infiammabile

Le sostanze e i preparati saranno classificati come facilmente infiammabili e contrassegnati dal simbolo F e dall'indicazione di pericolo <facilmente infiammabile> in funzione dei risultati delle prove contenute nell'allegato V. Le frasi indicanti i rischi specifici verranno assegnate in base ai seguenti criteri:

R7 Può provocare un incendio

Per sostanze e preparati reattivi, ad esempio fluoro, idrosolfato di sodio.

R14 Reagisce violentemente con l'acqua

Per sostanze e preparati che reagiscono violentemente con l'acqua, ad esempio cloruro di acetile, metalli alcalini e tetracloruro di titanio.

R16 Pericolo di esplosione se mescolato con sostanze comburenti

Per sostanze e preparati che reagiscono in modo esplosivo in presenza di comburenti, ad esempio fosforo rosso.

R18 Durante l'uso può formare con aria miscele esplosive/infiammabili

Per preparati che non sono classificati come infiammabili in quanto tali, ma che contengono componenti volatili infiammabili nell'aria.

R19 Può formare perossidi esplosivi

Per sostanze e preparati che durante il magazzinaggio possono dar luogo alla formazione di perossidi esplosivi, ad esempio etere dietilico, 1,4-diossano.

R30 Può divenire facilmente infiammabile durante l'uso

Per preparati non classificati come infiammabili in quanto tali ma che possono divenire infiammabili in seguito alla perdita di componenti volatili non infiammabili.

R44 Rischio di esplosione per riscaldamento in ambiente confinato

Per le sostanze e preparati che non sono classificati come esplosivi in base al punto 2.2.1 ma che presentano nondimeno proprietà esplosive se riscaldati in un contenitore chiuso. Ad esempio, alcune sostanze che esploderebbero se riscaldate in un fusto di acciaio ma che non presentano tali reazioni se riscaldate in contenitori meno robusti.

Per ulteriori frasi concernenti i rischi, vedere il paragrafo 3.2.7.

3. CLASSIFICAZIONE IN BASE ALLE PROPRIETÀ TOSSICOLOGICHE**3.1. Introduzione****3.1.1. La classificazione si basa sugli effetti acuti e su quelli a lungo termine delle sostanze e dei preparati, siano essi dovuti ad un'unica esposizione o ad un'esposizione ripetuta o prolungata.**

Se è possibile provare che l'effetto tossico sull'uomo delle sostanze e dei preparati è o potrebbe essere diverso da quello messo in evidenza dai risultati sperimentali ottenuti con le prove su animali o con l'applicazione del metodo convenzionale di cui all'articolo 3, paragrafo 5, del decreto ministeriale 28 gennaio 1992, le sostanze e i preparati vanno classificati in base alla tossicità per l'uomo. Tuttavia le prove sull'uomo dovrebbero essere scoraggiate e in nessun caso dovrebbero essere utilizzate per confutare i dati positivi riscontrati sugli animali.

3.1.2. La classificazione delle sostanze deve essere eseguita sulla base dei dati sperimentali disponibili in conformità dei criteri elencati in appresso, che prendono in considerazione l'entità dei suddetti effetti:

- a) per la tossicità acuta (effetti letali ed irreversibili dopo un'unica esposizione), i criteri di cui ai paragrafi dal 3.2.1 al 3.2.3;

- b) per la tossicità subacuta, subcronica o cronica, i criteri di cui ai paragrafi dal 3.2.2 al 3.2.4;
- c) per gli effetti corrosivi ed irritanti, i criteri di cui ai paragrafi dal 3.2.5 al 3.2.6;
- d) per gli effetti di sensibilizzazione, i criteri di cui al paragrafo 3.2.7;
- e) per gli effetti specifici sulla salute (effetti cancerogeni, mutageni e tossicità per la riproduzione), i criteri di cui al capitolo 4.

3.1.3. Nel caso dei preparati, la classificazione relativa ai pericoli per la salute viene eseguita:

- a) sulla base del metodo convenzionale di cui all'articolo 3, paragrafo 5 del decreto ministeriale 28 gennaio 1992 (in mancanza di dati sperimentali).

In tal caso, la classificazione si basa sui limiti di concentrazione specificati:

- nell'allegato 1 del decreto legislativo 3 febbraio 1997, n. 52;
- o nell'allegato 1 del decreto ministeriale 28 gennaio 1992, qualora la sostanza o le sostanze non figurino nell'allegato 1 del decreto legislativo 3 febbraio 1997, n. 52 o vi figurino senza limiti di concentrazione.
- b) o, qualora siano disponibili dati sperimentali, in conformità dei criteri di cui al punto 3.1.2, ad esclusione delle proprietà cancerogene, mutagene e tossiche per la riproduzione previste al punto 3.1.2, lettera e), che devono essere valutate con il metodo convenzionale di cui all'articolo 3 (5) da (j) a (q) del decreto ministeriale 28 gennaio 1992.

Qualunque sia il metodo utilizzato per valutare la pericolosità di un preparato, è necessario prendere in considerazione tutti gli effetti pericolosi per la salute definiti nell'allegato 1 del decreto ministeriale 28 gennaio 1992.

3.1.4. Quando la classificazione deve basarsi sui risultati sperimentali ottenuti con prove su animali, i risultati debbono essere validi anche per l'uomo, cioè le prove devono riprodurre in maniera adeguata i rischi per l'uomo.

3.1.5. La tossicità acuta per via orale delle sostanze o dei preparati immessi sul mercato può essere determinata con un metodo che consenta di valutare il valore LD₅₀ oppure determinando la dose discriminante (metodo a dose fissa).

La dose discriminante è quella che provoca tossicità evidente ma non la mortalità e deve essere uno dei quattro livelli di dose specificati nell'allegato V (5, 50, 500 o 2000 mg per kg di peso corporeo).

Il concetto di <tossicità evidente> serve a designare gli effetti tossici dopo esposizione alla sostanza sperimentata che sono così gravi che un'ulteriore esposizione alla successiva dose fissata provocherebbe probabilmente mortalità.

I risultati delle prove ad una dose particolare possono essere i seguenti:

- sopravvivenza inferiore al 100%
- sopravvivenza del 100%, ma con tossicità evidente
- sopravvivenza del 100%, senza nessuna tossicità evidente

Il metodo sperimentale in alcuni casi richiede prove a dosi superiori o inferiori se non sono ancora state effettuate prove al livello di dose pertinente. Vedi anche la tabella di valutazione del metodo di prova BI bis dell'allegato V.

Nei criteri di cui ai punti 3.2.1, 3.2.2 e 3.2.3 è indicato soltanto il risultato di prova finale. La dose 2000 mg/kg dovrebbe essere usata principalmente per ottenere informazioni sugli effetti tossici delle sostanze a bassa tossicità acuta e che non sono classificate in base al criterio di tossicità acuta.

3.2. Criteri per la classificazione, la scelta dei simboli, l'indicazione di pericolo e la scelta delle frasi di rischio

3.2.1. Molto tossico

Le sostanze e i preparati saranno classificati come molto tossici e contrassegnati dal simbolo T+ e dall'indicazione di pericolo <molto tossico> sulla base dei criteri qui di seguito specificati.

Le frasi indicanti i rischi saranno assegnate sulla base dei seguenti criteri:

R28 Molto tossico per ingestione

Risultati tossicità acuta:

- DL_{50} per via orale, ratto: ≤ 25 mg/kg
- dose discriminante, per via orale, ratto 5 mg/kg: sopravvivenza inferiore al 100% (metodo a dose fissa)

R27 Molto tossico a contatto con la pelle

Risultati tossicità acuta:

- DL_{50} per via cutanea, ratto o coniglio: ≤ 50 mg/kg

R26 Molto tossico per inalazione

Risultati tossicità acuta:

- CL_{50} per inalazione, ratto, per aerosol o particelle: $\leq 0,25$ mg/l/4 h
- CL_{50} per inalazione, ratto, per gas e vapori: $\leq 0,5$ mg/l/4 h

R39 Pericolo di effetti irreversibili molto gravi

- esistono valide indicazioni per ritenere che danni irreversibili, diversi da quelli esaminati nel capitolo 4 potrebbero essere causati da un'unica esposizione per via appropriata, in generale di dose compresa nella gamma di valori summenzionati.

Per indicare le modalità di somministrazione/esposizione, usare una delle combinazioni seguenti: R39/26, R39/27, R39/28, R39/26/27, R39/27/28, R39/26/27/28.

3.2.2 Tossico

Le sostanze e i preparati saranno classificati come tossici e contrassegnati dal simbolo T e dall'indicazione di pericolo <tossico> conformemente ai criteri sottoindicati. Le frasi indicanti rischi specifici saranno assegnate in base ai seguenti criteri:

R25 Tossico per ingestione

Risultati tossicità acuta:

- DL_{50} per via orale, ratto: $25 < DL_{50} \leq 200$ mg/kg
- dose discriminante, per via orale, ratto, 5 mg/kg: sopravvivenza del 100% ma tossicità evidente

R42 Tossico a contatto con la pelle**Risultati tossicità acuta**

- DL_{50} per via cutanea, ratto o coniglio: $50 < DL_{50} \leq 400$ mg/kg

R23 Tossico per inalazione**Risultati tossicità acuta:**

- CL_{50} per inalazione, ratto, per aerosol o particelle: $0,25 < CL_{50} \leq 1$ mg/l/4 h
- CL_{50} per inalazione, ratto, per gas e vapori: $0,5 < CL_{50} \leq 2$ mg/l/4 h

R39 Pericolo di effetti irreversibili molto gravi

- esistono valide indicazioni per ritenere che danni irreversibili, diversi da quelli presi in considerazione nel capitolo 4, potrebbero essere causati da un'unica esposizione per via appropriata, in generale di dose compresa nella gamma di valori summenzionata.

Per indicare le modalità di somministrazione/esposizione, usare una delle combinazioni seguenti: R39/23, R39/24, R39/25, R39/23/24, R39/23/25, R39/24/25, R39/23/24/25.

R48 Pericolo di gravi danni per la salute in caso di esposizione prolungata

- gravi danni (evidenti disturbi funzionali o mutamenti morfologici che abbiano rilevanza sul piano tossicologico) potrebbero essere causati da esposizioni ripetute o prolungate per via appropriata.

Le sostanze e i preparati sono classificati per lo meno come tossici qualora si osservino i suddetti effetti a livelli di intensità di un ordine di grandezza inferiore rispetto a quelli specificati al punto 3.2.3 per la frase R48 (ad esempio 10 volte).

Per indicare le modalità di somministrazione/esposizione, usare una delle combinazioni seguenti: R48/23, R48/24, R48/25, R48/23/24, R48/23/25, R48/24/25, R48/23/24/25.

3.2.3. Nocivo

Le sostanze e i preparati saranno classificati come nocivi e contrassegnati dal simbolo Xn e dall'indicazione di pericolo <nocivo> in base ai criteri indicati qui di seguito. Le frasi indicanti rischi specifici saranno assegnate secondo i seguenti criteri:

R22 Nocivo per ingestione**Risultati tossicità acuta:**

- DL_{50} per via orale, ratto: $200 < DL_{50} \leq 2000$ mg/kg
- dose discriminante, per via orale, ratto, 50 mg/kg: sopravvivenza del 100%, ma tossicità evidente
- dose discriminante, per via orale, ratto, 500 mg/kg: sopravvivenza inferiore al 100%, vedi tabelle di valutazione del metodo BI bis dell'allegato V

R21 Nocivo a contatto con la pelle**Risultati tossicità acuta**

- DL_{50} per via cutanea, ratto o coniglio: $400 < DL_{50} \leq 2000$ mg/kg

R20 Nocivo per inalazione

Risultati tossicità acuta:

- CL_{50} per via inalazione; ratto per aerosol o particelle : $1 < CL_{50} \leq 5 \text{ mg/l/4 h}$
- CL_{50} per via inalazione; ratto per gas o vapori: $2 < CL_{50} \leq 20 \text{ mg/l/4 h}$

R65 Nocivo: può causare danni ai polmoni in caso di ingestione

Le sostanze e i preparati liquidi che presentano per l'uomo un rischio di aspirazione data la loro ridotta viscosità:

- a) le sostanze e i preparati liquidi che contengono idrocarburi alifatici, aliciclici e aromatici in una concentrazione totale uguale o superiore al 10% e caratterizzati da:
- un tempo di scorrimento inferiore a 30 secondi in una vaschetta ISO di 3 mm, conformemente alla norma EN 535, oppure
 - una viscosità cinematica inferiore a $7 \times 10^{-6} \text{ m}^2/\text{secondo}$ a 40°C , misurata in un viscosimetro a capillare calibrato in vetro conformemente alla norma ISO 3104/3105, oppure
 - una viscosità cinematica inferiore a $7 \times 10^{-6} \text{ m}^2/\text{secondo}$ a 40°C , dedotta dalla misurazione della viscosità di rotazione conformemente alla norma ISO 3219.

Nota: le sostanze e i preparati che rispettano questi criteri non devono essere classificati se la tensione superficiale media è superiore a 25 mN/m a 40°C .

- b) altre sostanze e preparati che non rispondono ai suddetti criteri, sulla base di esperienze pratiche sull'uomo.

R40 Possibilità di effetti irreversibili

- esistono valide indicazioni per ritenere che danni irreversibili, diversi dagli effetti specificati nel capitolo 4, potrebbero essere causati da un'unica esposizione per via appropriata, in generale di dose compresa nella gamma di valori sopraindicata.

Per indicare le modalità di somministrazione/esposizione, usare una delle combinazioni seguenti: R40/20, R40/21, R40/22, R40/20/21, R40/20/22, R40/21/22, R40/20/21/22.

R48 Pericolo di gravi danni per la salute in caso di esposizione prolungata

- gravi danni (evidenti disturbi funzionali o mutamenti morfologici di rilevanza tossicologica) potrebbero essere causati da un'esposizione ripetuta o prolungata per via appropriata;

Le sostanze e i preparati sono classificati perlomeno come nocivi quando si osservano i suddetti effetti a livello dell'ordine di:

- per via orale, ratto $\leq 50 \text{ mg/kg}$ (di peso corporeo)/giorno
- per via cutanea, ratto o coniglio $\leq 100 \text{ mg/kg}$ (di peso corporeo)/giorno
- per inalazione, ratto, $\leq 0,25 \text{ mg/l}$, 6h/giorno

Questi valori guida possono applicarsi direttamente qualora nel corso di una prova di tossicità subcronica (90 giorni) siano state osservate gravi lesioni. Per l'interpretazione dei risultati di prove di tossicità subacuta (28 giorni), le suddette cifre sono circa 3 volte maggiori. Qualora esista una prova di tossicità cronica (2 anni), questa dovrebbe essere valutata caso per caso. Se esistono risultati di studi di diversa durata, generalmente si utilizzano quelli ricavati dallo studio di più lunga durata.

Per indicare le modalità di somministrazione/esposizione, usare una delle combinazioni seguenti: R48/20, R48/21, R48/22, R48/20/21, R48/21/22, R48/20/21/22.

3.2.3.1. Osservazioni riguardanti le sostanze molto volatili

Per alcune sostanze con una tensione di vapore molto elevata possono esservi dei segni che indicano gli effetti atti a suscitare preoccupazione. Tali sostanze possono non essere classificate in base ai criteri per gli effetti sulla salute di cui al punto 3.2.3. Se però si hanno delle prove del possibile rischio legato alla manipolazione e all'uso normali di tali sostanze, può essere necessario usare la classificazione <nocivo>, caso per caso, con una frase adeguata.

Tali sostanze saranno classificate nell'allegato I con gli opportuni limiti di concentrazione.

3.2.4. Osservazioni concernenti l'impiego della frase R48

Questa frase di rischio è utilizzata per la gamma specifica di effetti biologici secondo le definizioni fornite in appresso. Per l'applicazione di questa frase di rischio, la definizione di gravi danni per la salute comprende la morte, evidenti disturbi funzionali o mutamenti morfologici di rilevanza tossicologica, soprattutto qualora tali mutamenti siano irreversibili. E' altresì importante prendere in considerazione non solo specifici mutamenti gravi in un unico organo o sistema biologico, ma anche mutamenti generalizzati meno gravi in più organi, o mutamenti gravi nello stato generale di salute.

Le indicazioni fornite in appresso servono da riferimento per valutare l'esistenza dei suddetti effetti.

1. Prove che determinano l'impiego della frase R48

a) Morte correlata a una sostanza

b) i) gravi mutamenti funzionali nel sistema nervoso centrale o periferico, inclusa la vista, l'udito e l'odorato, riscontrati tramite osservazioni cliniche o altri metodi adeguati (ad es. l'elettrofisiologia).

ii) gravi mutamenti funzionali in altri apparati (ad es. polmoni).

c) qualsiasi mutamento rilevante nei parametri clinici biochimici, ematologici e delle analisi delle urine che indicano gravi disfunzioni organiche. I disturbi a livello ematologico sono particolarmente importanti qualora esistano prove che questi sono dovuti ad una minore produzione di cellule ematiche da parte del midollo osseo.

d) gravi danni organici riscontrati all'esame al microscopio a seguito di un'autopsia.

i) necrosi diffuse o gravi, formazione di fibrosi o di granulomi in organi vitali con capacità rigenerativa (ad esempio il fegato).

ii) gravi mutamenti morfologici potenzialmente reversibili, che indicano tuttavia un'evidente disfunzione organica (ad esempio una grave infiltrazione grassa nel fegato, una grave nefropatia tubulare acuta nel rene, una gastrite ulcerosa).

iii) prove di una estesa morte cellulare in organi vitali che non si rigenerano (ad esempio la fibrosi del miocardio o la degenerazione di un nervo, o nelle popolazioni di cellule staminali (ad esempio l'aplasia o l'ipoplasia del midollo osseo).

Le suddette prove sono generalmente ricavate da esperimenti su animali. Quando si valutano i dati ricavati dall'esperienza pratica, è necessario prestare particolare attenzione ai livelli di esposizione.

2. Prove indicanti che la frase R48 non deve essere utilizzata.

L'impiego della suddetta frase di rischio è limitata ai casi di <gravi danni per la salute in caso di esposizione prolungata>. Sia negli esseri umani sia negli animali è possibile osservare un certo numero di effetti correlati alle sostanze che non giustificano l'impiego della frase R48 e che sono comunque rilevanti quando si voglia determinare un livello di <manca di effetto> di una

sostanza chimica. Segue un elenco di mutamenti ben documentati che, indipendentemente dalla loro rilevanza statistica, normalmente non richiedono l'impiego della frase R48.

- a) osservazioni o mutamenti clinici nell'aumento del peso, nel consumo di cibo o nell'assunzione di acqua che possono avere una certa rilevanza tossicologica ma che, di per se stessi, non sono indice di <gravi danni>.
- b) piccoli mutamenti nei parametri clinici biochimici, ematologici e delle analisi delle urine, di dubbia o minima importanza tossicologica.
- c) mutamenti di peso degli organi senza segni di disfunzioni organiche.
- d) risposte di adattamento (ad esempio migrazione di macrofagi nel polmone, ipertrofia epatica ed induzione enzimatica, risposte iperplastiche alle sostanze irritanti). Effetti locali sulla pelle dovuti all'applicazione cutanea ripetuta di una sostanza, classificati più propriamente con la frase R38 <Irritante per la pelle>.
- e) nei casi in cui si sia dimostrato un meccanismo di tossicità specifico di specie (ad esempio tramite <cicli metabolici specifici>).

3.2.5. Corrosivo

Una sostanza o un preparato sono considerati corrosivi se, applicati sulla pelle sana ed intatta di un animale, distruggono l'intero spessore del tessuto cutaneo in almeno un animale durante l'esecuzione della prova di irritazione cutanea di cui all'allegato V o di un metodo equivalente, ovvero se il risultato può essere previsto, ad esempio in base alle reazioni fortemente acide o alcaline (pH dimostrato di 2 o meno o 11,5 o superiore. Si deve tener conto anche della riserva alcalina o acidica). La classificazione può basarsi sui risultati di prove in vitro convalidate.

Le sostanze ed i preparati saranno classificati come corrosivi e contrassegnati dal simbolo C e dall'indicazione di pericolo <Corrosivo>. Le frasi di rischio verranno assegnate conformemente ai seguenti criteri:

R35 Provoca gravi ustioni

- se, in caso di applicazione sulla pelle sana ed intatta di un animale, distrugge l'intero spessore del tessuto cutaneo dopo un'esposizione di non oltre 3 minuti o se questo risultato può essere previsto.

R34 Provoca ustioni

- se, in caso di applicazione sulla pelle sana ed intatta di un animale, distrugge l'intero spessore del tessuto cutaneo dopo un'esposizione di non oltre 4 ore o se tale risultato può essere previsto.
- idroperossidi organici, tranne se si hanno prove del contrario.

3.2.6. Irritante

Le sostanze e i preparati saranno classificati come irritanti e contrassegnati con il simbolo Xi e l'indicazione di pericolo <Irritante> in conformità dei criteri qui di seguito.

3.2.6.1. Infiammazione della pelle

Le seguenti frasi di rischio saranno assegnate conformemente ai criteri indicati:

R38 Irritante per la pelle

- Sostanze e preparati che provocano una significativa infiammazione della pelle che persista per almeno 24 ore dopo un periodo massimo di esposizione di 4 ore, determinati sul coniglio secondo il metodo di prova dell'irritazione cutanea di cui all'allegato V.

L'infiammazione della pelle è significativa se:

- il valore medio del conteggio per l'eritema e la formazione di escara o la formazione di edema, calcolato per tutti gli animali sottoposti a prova, pari o superiore a 2,
- ovvero, nello svolgimento della prova dell'allegato V su tre animali, quando si osservi in almeno due animali eritema e formazione di escara o formazione di edema di valore medio pari o superiore a 2 calcolato per ciascun animale separatamente.

In ambedue i casi tutti i risultati del conteggio per ciascuno dei tempi di rilevazione degli effetti (24, 48, 72 ore) vanno utilizzati per calcolare i rispettivi valori medi.

L'infiammazione della pelle è inoltre significativa se persiste in almeno due animali al termine del periodo di osservazione. Si dovranno prendere in considerazione effetti particolari, quali iperplasia, desquamazione, scolorimento, screpolature, croste e alopecia.

- Sostanze e preparati che provocano una significativa infiammazione della pelle, in base ad osservazioni pratiche sulle persone.
- Perossidi organici, tranne nei casi in cui si ha la prova del contrario.

Irritazione dovuta alle caratteristiche sgrassanti di una sostanza:

Se in base ai risultati di prove oppure all'esperienza pratica si riscontra irritazione in base ai criteri precedenti, usare frasi di rischio. Si devono tuttavia usare frasi S se vi sono motivi per sospettare che le caratteristiche sgrassanti della sostanza possono provocare irritazione nelle persone anche se non vi è rispondenza con i criteri di cui sopra oppure è stata utilizzata una prova inopportuna.

3.2.6.2. Lesioni oculari

Le seguenti frasi di rischio saranno assegnate anche conformemente ai criteri indicati:

R36 Irritante per gli occhi

- Sostanze e preparati che, se applicati sugli occhi dell'animale, provocano entro 72 ore dall'esposizione significative lesioni oculari che persistono per almeno 24 ore.

Le lesioni oculari sono significative se i risultati medi della prova di irritazione oculare di cui all'allegato V corrispondono a uno dei seguenti valori:

- opacità della cornea pari o superiore a 2 ma inferiore a 3,
- lesione dell'iride pari o superiore a 1 ma non superiore a 1,5,
- arrossamento della congiuntiva pari o superiore a 2,5;
- edema della congiuntiva (chemosi) pari o superiore a 2

o quando, nel caso in cui la prova dell'allegato V sia effettuata su tre animali, le lesioni in due o più animali presentano valori equivalenti a quelli sopra indicati, salvo nel caso della lesione dell'iride il cui valore dovrebbe essere uguale o superiore a 1 ma inferiore a 2 e dell'arrossamento della congiuntiva il cui valore dovrebbe essere uguale o superiore a 2,5

In ambedue i casi tutti i risultati del conteggio per ciascuno dei tempi di rilevazione degli effetti (24, 48, 72 ore) vanno utilizzati per calcolare i rispettivi valori medi

- Sostanza o preparati che provocano significative lesioni oculari verificate attraverso osservazioni pratiche sulle persone.

- Perossidi organici tranne se si hanno prove del contrario.

R41 Rischio di gravi lesioni oculari

- Sostanze e preparati che se applicati nell'occhio di un animale, entro 72 ore dall'esposizione producono gravi lesioni che persistono per almeno 24 ore o più dopo l'istillazione del prodotto in esame.

Le lesioni oculari sono gravi se le medie dei valori della prova di irritazione oculare di cui all'allegato V sono pari a uno dei seguenti valori:

- opacità della cornea uguale o maggiore di 3;
- lesione dell'iride maggiore di 1,5.

Lo stesso vale nel caso in cui la prova sia stata eseguita su tre animali se le lesioni, in due o più animali, presentano uno dei seguenti valori:

- opacità della cornea uguale o maggiore di 3;
- lesione dell'iride uguale a 2.

In entrambi i casi tutti i risultati di ciascun tempo di rilevazione degli effetti (24, 48 e 72 ore) vanno utilizzati per calcolare i rispettivi valori medi.

Le lesioni oculari sono anche gravi se persistono alla fine del tempo di osservazione.

Le lesioni oculari sono anche gravi se la sostanza o il preparato provocano una colorazione irreversibile dell'occhio:

Sostanze e preparati che provocano gravi lesioni oculari, verificate attraverso osservazioni pratiche sulle persone.

Nota:

Se una sostanza o un preparato sono classificati come corrosivi e contrassegnati con R34 o R 35, il rischio di grave danno all'occhio va considerato implicito e R41 non figura sull'etichetta. Tuttavia nel caso di preparati nel calcolo del totale dei quozienti in base alla formula di cui ai punti 3.5 (f) (ii) e 3.5 (h) (ii) del decreto ministeriale 28 gennaio 1992, le sostanze classificate come corrosive devono essere considerate come se la frase R41 sia stata assegnata.

3.2.6.3. Irritazione delle vie respiratorie

La seguente frase di rischio sarà assegnata conformemente ai suddetti criteri:

R37 Irritante per le vie respiratorie

Sostanze e preparati che causano gravi irritazioni del sistema respiratorio, verificate attraverso

- osservazioni pratiche nell'uomo
- reazioni positive negli esperimenti sugli animali.

Osservazioni concernenti l'impiego della frase R37

Nell'interpretare le osservazioni pratiche nell'uomo, occorre fare la distinzione tra gli effetti che determinano la classificazione con la frase R48 (cfr. sezione 3.2.4) e gli effetti che determinano la classificazione con la frase R37. Le condizioni che normalmente determinano la classificazione con R37 sono reversibili e solitamente limitate alle vie respiratorie superiori.

Risultati positivi ottenuti con prove adeguate su animali possono includere dei dati ottenuti in una prova di tossicità, in particolare dati istopatologici relativi al sistema respiratorio. Per valutare l'irritazione delle vie respiratorie si possono utilizzare dei dati ottenuti con la bradipnea provocata.

3.2.7. Sensibilizzazione

3.2.7.1. Sensibilizzazione per inalazione

Le sostanze e i preparati sono classificati come sensibilizzanti e contrassegnati dal simbolo "Xn", dall'indicazione del pericolo "nocivo" e dalla frase di rischio R42 secondo i seguenti criteri:

R42 Può provocare sensibilizzazione per inalazione

- se esistono prove che dimostrano che le sostanze e i preparati possono provocare una ipersensibilità respiratoria specifica
- se gli esperimenti sugli animali hanno dato risultati positivi
- se la sostanza è un isocianato, a meno che non sia stato provato che essa non provochi un'ipersensibilità respiratoria.

Osservazioni concernenti l'impiego della frase R42

Effetti sull'uomo

Le prove che la sostanza può provocare un'ipersensibilità respiratoria specifica saranno in linea di massima basate sugli esperimenti pratici sull'uomo. In queste condizioni, l'asma viene considerata come manifestazione dell'ipersensibilità, ma si tiene conto di altre reazioni come la rinite e l'alveolite. La condizione osservata si presenterà come una reazione allergica, tuttavia non è necessario dimostrare la presenza di meccanismi immunologici.

Nei casi esaminare le prove risultanti dall'esposizione dell'uomo, oltre alle prove fornite dai casi considerati, occorre tener conto degli elementi seguenti:

- importanza della popolazione esposta
- grado di esposizione.

Le suddette prove possono essere:

- antecedenti medici e dati ottenuti con delle prove specifiche di funzionalità polmonare in relazione ad esposizioni alla sostanza, confermate da altre prove, ad esempio:
 - una struttura chimica associata a sostanze che notoriamente causano un'ipersensibilità respiratoria;
 - una prova immunologica in vivo (ad esempio, test cutaneo);
 - una prova immunologica in vitro (ad esempio, analisi sierologica);
- studi che possono evidenziare altri meccanismi specifici, non immunologici, ad esempio una leggera irritazione ricorrente o effetti indotti da un'azione farmacologica;
- dati ottenuti nel corso di prove positive di provocazione sui bronchi svolte secondo orientamenti comunemente accettati per la determinazione di una reazione specifica d'ipersensibilità.

Gli antecedenti clinici devono includere sia gli antecedenti medici che quelli professionali, al fine di determinare la relazione tra l'esposizione ad una sostanza particolare e lo sviluppo di un'ipersensibilità respiratoria. Le informazioni di cui tener conto vertono in particolare sui fattori di aggravamento sia nel proprio domicilio che sul posto di lavoro, sulla comparsa e

l'evoluzione della malattia, sugli accertamenti familiari e medici del paziente esaminato. Gli antecedenti medici devono includere anche la menzione di altri disordini allergici o respiratori comparsi durante l'infanzia, nonché gli antecedenti legati al tabagismo.

I risultati delle prove positive di provocazione sui bronchi sono considerati prove sufficienti ai fini della classificazione. Si riconosce tuttavia che nella pratica molti dei suddetti esami saranno stati già effettuati.

Le sostanze che provocano sintomi di asma per irritazione solo nei soggetti che soffrono di iperreattività dei bronchi non devono essere caratterizzati con la frase R42.

Studi sugli animali

I dati ottenuti dalle prove che possono indicare la capacità di una sostanza di provocare una sensibilizzazione mediante inalazione nell'uomo possono essere in particolare:

- misurazione dell'IgE (per esempio sui topi)
- reazioni polmonari specifiche nelle cavie.

3.2.7.2. Sensibilizzazione per contatto con la pelle

Le sostanze e i preparati saranno classificati come sensibilizzanti e contrassegnati dal simbolo "Xi", dall'indicazione di pericolo "Irritante" e dalla frase di rischio "R43", conformemente ai criteri seguenti:

R43 Può comportare una sensibilizzazione per contatto con la pelle

- se l'esperienza dimostra che le sostanze e i preparati possono provocare una sensibilizzazione per contatto con la pelle in un numero significativo di persone;
se delle prove adeguate sugli animali danno risultati positivi.

Osservazioni concernenti l'impiego della frase R43.

Prove degli effetti sull'uomo

Le prove seguenti (esperienza pratica) sono sufficienti per classificare una sostanza con la frase R43:

- dati positivi ottenuti con adeguati test cutanei, in linea di massima effettuati in più cliniche dermatologiche, o
- studi epidemiologici che dimostrino la comparsa di dermatosi allergiche da contatto causati dalla sostanza. Le situazioni in cui buona parte delle persone esposte manifestano sintomi caratteristici devono essere valutate con particolare attenzione, anche se in numero di casi è ridotto; o
- dati positivi ottenuti nel corso di studi sperimentali nell'uomo (cfr. il paragrafo 3.1.1).

Gli elementi sono sufficienti per classificare una sostanza con la frase R43 se sono corroborati da prove:

- episodi isolati di dermatite allergica da contatto, o
- studi epidemiologici in cui il caso, le distorsioni o i sintomi equivoci non sono stati esclusi con ragionevole certezza.

Le prove a sostegno possono essere in particolare:

- dati ottenuti nel corso di prove sugli animali realizzate sulla base di orientamenti noti, con risultati non conformi ai criteri illustrati nella sezione relativa agli studi sugli animali, ma sufficientemente vicini ai limiti per essere considerati significativi;

- dati ottenuti con metodi non normalizzati, o
- rapporti adeguati struttura-attività.

Studi sugli animali

Risultati positivi di prove pertinenti sugli animali sono:

nel caso del metodo di prova di tipo ausiliare per la sensibilizzazione della pelle di cui all'allegato V o nel caso di altri metodi di prova di tipo ausiliare, una reazione di almeno 30 % degli animali è considerata positiva. Per tutti gli altri metodi di prova, una reazione di almeno 15% degli animali è considerata positiva.

3.2.7.3. *Orticaria immunologica da contatto*

Determinate sostanze che rispondono ai criteri della frase R42 possono inoltre provocare orticaria immunologica da contatto. In questo caso, occorre includere informazioni relative alle orticarie da contatto avvalendosi delle frasi S pertinenti (generalmente le frasi S24 e S36/37) e inserendole nella scheda dei dati relativi alla sicurezza.

Per le sostanze che provocano orticarie immunologiche da contatto e che non rispondono ai criteri corrispondenti alla frase R42, è opportuno prevedere la classificazione con la frase R43.

Non esistono modelli animali riconosciuti per individuare le sostanze che provocano delle orticarie da contatto. La classificazione pertanto si dovrà basare sui risultati ottenuti con le prove sull'uomo, simili a quelle relative alla sensibilizzazione cutanea (R43).

3.2.7.4. E' opportuno rilevare che se si attribuisce il simbolo "Xn" e l'indicazione di pericolo "nocivo", il simbolo "Xi" e l'indicazione di pericolo "irritante" sono facoltativi.

3.2.8. Altre proprietà tossicologiche

Ulteriori frasi di rischio saranno assegnate alle sostanze e preparati classificati in base ai principi di cui ai punti da 2.2.1 a 3.2.7, conformemente ai seguenti criteri (che si basano sulle esperienze raccolte durante l'elaborazione dell'allegato I):

R29 A contatto con l'acqua libera gas tossici

Per sostanze e preparati che a contatto con l'acqua o con l'aria umida sprigionano gas tossici o molto tossici in quantitativi potenzialmente pericolosi, ad esempio fosfuro di alluminio, pentasolfuro di fosforo.

R31 A contatto con acidi libera gas tossici

Per sostanze e preparati che reagiscono con acidi sprigionando gas tossici in quantità pericolose, ad esempio ipoclorito di sodio, polisolfuro di bario. Per le sostanze in vendita al dettaglio sarebbe più opportuno utilizzare la frase S50 [non mescolare con ... (da specificare da parte del fabbricante)].

R32 A contatto con acidi libera gas molto tossici

Per sostanze e preparati che reagiscono con acidi sprigionando gas molto tossici in quantità pericolosa, ad esempio sali dell'acido cianidrico, azoturo di sodio. Per le sostanze in vendita al dettaglio sarebbe più opportuno utilizzare la frase S50 [non mescolare con ... (da specificare da parte del fabbricante)].

R33 Pericolo di effetti cumulativi

Per sostanze e preparati il cui accumulo nell'organismo umano può apparire preoccupante, non però di gravità tale da indurre a utilizzare la frase R48.

R64 Possibile rischio per i bambini allattati al seno

Per le sostanze e i preparati, assorbiti dalle donne, che possono interferire con la lattazione o che possono essere presenti (metaboliti compresi) nel latte materno in quantità sufficienti a causare preoccupazioni per la salute dei bambini.

Per ulteriori frasi di rischio cfr. punto 2.2.6.

4. CLASSIFICAZIONE IN BASE AGLI EFFETTI SPECIFICI SULLA SALUTE**4.1. Introduzione**

4.1.1. Procedura per la classificazione delle sostanze che possono presentare gli effetti menzionati nel presente capitolo.

4.1.2. Se un fabbricante o il suo rappresentante dispone di informazioni secondo le quali una sostanza dovrebbe essere classificata ed etichettata in conformità dei criteri di cui ai punti 4.2.1, 4.2.2 o 4.2.3, la sostanza sarà temporaneamente etichettata conformemente ai suddetti criteri, a meno che dall'applicazione dei criteri di cui ai punti da 3.2.1 a 3.2.5 non sia risultata necessaria una classificazione più rigorosa.

4.1.3. Il fabbricante o il suo rappresentante dovrà presentare il più rapidamente possibile allo Stato membro nel quale la sostanza è immessa sul mercato un documento che contenga tutte le informazioni sull'argomento. Questo documento deve contenere una bibliografia, con tutti i necessari riferimenti e può includere dati non pubblicati.

4.1.4. Inoltre, il fabbricante o il suo rappresentante in possesso di nuovi dati relativi alla classificazione e all'etichettatura di una sostanza in conformità dei criteri di cui ai punti 4.2.1, 4.2.2 o 4.2.3, li presenterà il più rapidamente possibile allo Stato membro nel quale la sostanza è immessa sul mercato.

4.1.5. Affinchè la classificazione venga rapidamente armonizzata a livello comunitario, in conformità della procedura dell'articolo 28 della direttiva 67/548/CEE, gli Stati membri che dispongono di informazioni fornite o no dal fabbricante, secondo le quali sarebbe opportuno classificare una sostanza in una delle categorie anzidette, devono inviare senza indugio alla Commissione le informazioni in questione, corredate di proposte di classificazione ed etichettatura.

La Commissione comunica le proposte di classificazione e di etichettatura pervenute agli altri Stati membri. Gli Stati membri possono rivolgersi alla Commissione per ottenere le informazioni che le sono state presentate.

Qualsiasi Stato membro che abbia validi motivi per ritenere che le proposte di classificazione ed etichettatura siano inadeguate per quanto si riferisce agli effetti cancerogeni, mutageni o di tossicità riproduttiva dà comunicazione alla Commissione.

4.2. Criteri per la classificazione, l'indicazione di pericolo e la scelta delle frasi di rischio**4.2.1. Sostanze cancerogene**

Ai fini della classificazione e dell'etichettatura e sulla base delle attuali conoscenze queste sostanze sono suddivise in tre categorie:

Categoria 1

Sostanze note per gli effetti cancerogeni sull'uomo. Esistono prove sufficienti per stabilire un nesso causale tra l'esposizione dell'uomo ad una sostanza e lo sviluppo di tumori.

Categoria 2

Sostanze che dovrebbero considerarsi cancerogene per l'uomo. Esistono elementi sufficienti per ritenere verosimile che l'esposizione dell'uomo ad una sostanza possa provocare lo sviluppo di tumori, in generale sulla base di:

- adeguati studi a lungo termine effettuati su animali,
- altre informazioni specifiche.

Categoria 3

Sostanze da considerare con sospetto per i possibili effetti cancerogeni sull'uomo per le quali tuttavia le informazioni disponibili non sono sufficienti per procedere ad una valutazione soddisfacente. Esistono alcune prove ottenute da adeguati studi sugli animali che non bastano tuttavia per classificare la sostanza nella categoria 2.

4.2.1.1. I seguenti simboli e specifiche frasi di rischio vanno utilizzati:

Categorie 1 e 2:

T ; R45 Può provocare il cancro

Tuttavia, per le sostanze ed i preparati che presentino un rischio cancerogeno soltanto per inalazione, ad esempio sotto forma di polveri, vapori o fumi (altre vie di esposizione, ad esempio per ingestione o a contatto con la pelle, non presentano alcun rischio cancerogeno), vanno utilizzati i seguenti simboli e le specifiche frasi di rischio:

T ; R49 Può provocare il cancro per inalazione

Categoria 3:

Xn ; R40 Possibilità di effetti irreversibili

4.2.1.2. Osservazioni sulla classificazione delle sostanze cancerogene

Una sostanza viene inserita nella categoria 1 in base ai dati epidemiologici; la collocazione nelle categorie 2 e 3 si basa fondamentalmente sugli esperimenti sugli animali.

Per classificare una sostanza come cancerogena della categoria 2, è necessario disporre di risultati positivi in due specie di animali, o di prove positive evidenti in una specie, nonché di altri elementi quali i dati sulla genotossicità, gli studi metabolici o biochimici, l'induzione di tumori benigni, la relazione strutturale con altre sostanze cancerogene note, o i dati derivanti da studi epidemiologici che mettano in relazione la sostanza con l'insorgenza della malattia.

La categoria 3 comprende due sottocategorie:

- a) sostanze oggetto di ricerche approfondite che non possono essere classificate nella categoria 2 per mancanza di prove sufficienti sui loro effetti cancerogeni. Si ritiene che nemmeno nuovi esperimenti possano fornire ulteriori informazioni determinanti in merito alla classificazione;
- b) sostanze oggetto di studi insufficienti. I dati disponibili sono ancora scarsi, ma si rilevano preoccupanti per gli esseri umani. Tale classificazione è provvisoria in quanto è necessario effettuare ulteriori esperimenti prima di prendere la decisione finale.

La distinzione tra le categorie 2 e 3 si fonda sulle informazioni elencate in appresso, che ridimensionano la rilevanza dei tumori indotti per via sperimentale in vista di una possibile esposizione degli esseri umani. Tali informazioni, soprattutto se combinate tra loro, porterebbero nella maggior parte dei casi alla classificazione della sostanza nella categoria 3, anche qualora vi sia stata un'insorgenza di tumori negli animali:

- effetti cancerogeni solo in presenza di dosi molto elevate, superiori alla <dose massima tollerata>. La dose massima tollerata si caratterizza per effetti tossici che, sebbene non riducano ancora la durata della vita, implicano tuttavia mutamenti fisici quali un rallentamento di circa il 10% nell'aumento del peso;
- comparsa di tumori, soprattutto per dosi massicce, solamente in determinati organi di alcune specie note per la loro propensione all'insorgenza spontanea di tumori;
- comparsa di tumori, solo nel punto di applicazione, con sistemi di prova molto sensibili (ad esempio la somministrazione intraperitoneale o sottocutanea di taluni composti attivi localmente), qualora il bersaglio specifico non sia rilevante per gli esseri umani;
- mancanza di genotossicità in prove a breve termine *in vivo* ed *in vitro*;
- esistenza di un meccanismo secondario di azione che comporta, per la sua attivazione, una soglia empirica al di sopra di una determinata dose (ad esempio, effetti ormonali sugli organi o sui meccanismi di regolazione fisiologica, o stimolazione cronica della proliferazione cellulare);
- esistenza di un meccanismo di formazione tumorale specifico di specie (ad esempio, determinato da particolari cicli metabolici), che risulta irrilevante per gli esseri umani.

La distinzione tra le sostanze da inserire nella categoria 3 e quelle non classificabili in alcuna categoria si basa su informazioni che escludano una eventuale pericolosità per gli esseri umani.

- una sostanza non dovrebbe essere classificata in alcuna delle categoria di cui sopra qualora il meccanismo che determina l'insorgenza tumorale per via sperimentale sia chiaramente identificato, ed esistano prove sufficienti che il suddetto processo non può svilupparsi negli esseri umani;
- una sostanza non può essere classificata in alcuna categoria se gli unici dati disponibili sono rappresentati dai tumori epatici in talune razze di topi sensibili, senza ulteriori prove;
- è necessario prestare particolare attenzione a tutti i casi dove gli unici dati disponibili sono quelli relativi all'insorgenza di neoplasmi in sedi e in razze che presentano un elevato tasso di insorgenza spontanea.

4.2.2. Sostanze mutagene

4.2.2.1. Ai fini della classificazione e dell'etichettatura e sulla base delle attuali conoscenze queste sostanze sono suddivise in tre categorie:

Categoria 1

Sostanze di cui si conoscono gli effetti mutageni sugli esseri umani.

Esistono prove sufficienti per stabilire un nesso causale tra l'esposizione degli esseri umani ad una sostanza e le alterazioni genetiche ereditarie.

Categoria 2

Sostanze che dovrebbero considerarsi mutagene per gli esseri umani.

Esistono prove sufficienti per ritenere verosimile che l'esposizione dell'uomo alla sostanza possa provocare lo sviluppo di alterazioni genetiche ereditarie, in generale sulla base di:

- adeguati studi su animali,
- altre informazioni rilevanti.

Categoria 3

Sostanze da considerare con sospetto per possibili effetti mutageni. Esistono prove fornite da studi specifici sugli effetti mutageni, ma non sono sufficienti per classificare la sostanza nella categoria 2.

4.2.2.2. *Vanno assegnati i seguenti simboli e le specifiche frasi di rischio*

Categoria 1:

T ; R46 Può provocare alterazioni genetiche ereditarie

Categoria 2

T ; R46 Può provocare alterazioni genetiche ereditarie

Categoria 3

Xn ; R40 Possibilità di effetti irreversibili

4.2.2.3. *Osservazioni sulla classificazione delle sostanze mutagene*

Definizione dei termini:

Una mutazione è l'alterazione permanente di un tratto o della struttura del materiale genetico di un organismo, che provoca un mutamento delle caratteristiche fenotipiche dell'organismo stesso. Le alterazioni possono coinvolgere un unico gene, un raggruppamento di geni o un intero cromosoma. Gli effetti su singoli geni possono-essere la conseguenza degli effetti su singole basi del DNA (mutazioni puntiformi) o di alterazioni di tratti più ampi, incluse le delezioni, all'interno di un gene. Gli effetti su interi cromosomi possono comportare alterazioni della struttura o del numero dei cromosomi. Una mutazione delle cellule germinali degli organismi a riproduzione sessuata può essere trasmessa alla progenie. I mutageni sono agenti che aumentano la frequenza delle mutazioni.

E' necessario sottolineare che le sostanze sono classificate come mutagene con particolare riferimento alle alterazioni genetiche ereditarie. Tuttavia, il tipo di risultati che determinano la classificazione delle sostanze chimiche nella categoria 3, vale a dire <l'induzione di eventi rilevanti dal punto di vista genetico nelle cellule somatiche>, vengono generalmente considerati come indice di una possibile attività cancerogena.

Lo sviluppo delle metodologie relative alle prove di mutagenicità è in continua evoluzione. Per alcuni nuovi test non esistono ancora protocolli o criteri di valutazione standardizzati. Per valutare i dati di mutagenicità, è necessario prendere in considerazione la qualità dell'esecuzione delle prove e il grado di validità del metodo di prova utilizzato.

Categoria 1

Per collocare una sostanza nella categoria 1, è necessario disporre di prove positive derivanti da studi epidemiologici sulle mutazioni negli esseri umani; fino ad oggi non si conoscono esempi delle suddette sostanze. E' risaputo infatti che è estremamente difficile ottenere informazioni attendibili dagli studi sull'incidenza delle mutazioni nella popolazione umana o sul possibile aumento della loro frequenza.

Categoria 2

Per collocare una sostanza nella categoria 2, è necessario disporre di risultati positivi ottenuti in prove che dimostrino a) gli effetti mutageni, o b) altre interazioni cellulari relative alla mutagenicità nelle cellule germinali di mammiferi in vivo o c) gli effetti mutageni sulle cellule somatiche di mammiferi in vivo, unitamente a prove evidenti che la sostanza o un metabolita raggiungano le cellule germinali.

Per quanto concerne la collocazione di una sostanza nella categoria 2, attualmente si impiegano i metodi seguenti:

2 (a) Prove di mutagenicità sulle cellule germinali *in vivo*:

- test di mutazione per un locus specifico;
- prova di traslocazione ereditabile;
- test di mutazione letale dominante.

Le suddette prove dimostrano l'effettiva comparsa di mutazioni nella progenie o di alterazioni negli embrioni.

2 (b) Prove *in vivo* che dimostrano una rilevante interazione con le cellule germinali (di solito il DNA):

- test per le aberrazioni cromosomiche, rilevate tramite analisi citogeniche, inclusa l'aneuploidia, causate da una segregazione anomala dei cromosomi;
- test dello scambio tra cromatidi fratelli (SCE);
- test della sintesi del DNA non programmata (UDS);
- test del legame (covalente) del mutageno con il DNA della cellula germinale;
- test per la rilevazione di altri tipi di alterazioni del DNA.

I suddetti test forniscono prove di natura più o meno indiretta. I risultati positivi conseguiti con queste prove devono in genere essere confortati da risultati positivi ottenuti in test di mutagenicità su cellule somatiche *in vivo* eseguiti su mammiferi o sull'uomo [vedi categoria 3, soprattutto i metodi descritti al punto 3(a)].

2 (c) Prove *in vitro* che dimostrano gli effetti mutageni sulle cellule somatiche dei mammiferi [vedi punto 3(a)], unitamente a metodi tossico-cinetici o ad altre metodologie in grado di dimostrare che il composto o un metabolita raggiungono le cellule germinali.

Per quanto concerne i punti 2(b) e 2 (c), i risultati positivi derivanti da prove effettuate sull'ospite o la dimostrazione di effetti inequivocabili ottenuti nei test *in vitro* possono considerarsi come prove certe.

Categoria 3

Per collocare una sostanza nella categoria 3, è necessario ottenere risultati positivi da test che dimostrino (a) gli effetti mutageni o (b) altre interazioni cellulari relative alla mutagenicità nelle cellule somatiche dei mammiferi *in vivo*. Soprattutto queste ultime sono normalmente confermate dai risultati positivi ottenuti in prove di mutagenicità *in vitro*.

Per quanto concerne gli effetti sulle cellule somatiche *in vivo*, attualmente si utilizzano i seguenti metodi:

3 (a) Prove di mutagenicità sulle cellule somatiche *in vivo*:

- prova del micronucleo del midollo osseo o analisi della metafase;
- analisi della metafase dei linfociti periferici;
- spot test sul colore della pelliccia dei topi.

3 (b) Prove di interazione del DNA delle cellule somatiche *in vivo*:

- test dello scambio tra cromatidi fratelli nelle cellule somatiche;
- test della sintesi del DNA non programmata nelle cellule somatiche;
- test per il legame (covalente) del mutageno con il DNA delle cellule somatiche;
- test delle alterazioni del DNA, ad esempio attraverso l'eluizione alcalina, nelle cellule somatiche.

Le sostanze che forniscono risultati positivi soltanto in una o più prove di mutagenicità *in vitro* in genere non dovrebbero essere classificate; è tuttavia opportuno approfondire le ricerche utilizzando prove *in vivo*. In casi eccezionali, ad esempio per sostanze che presentano risultati chiari in numerose prove *in vitro* ma per le quali non esistono i relativi dati delle prove *in vivo*, e che presentano affinità con mutageni o cancerogeni noti, si può prendere in considerazione la possibilità di classificarle nella categoria 3.

4.2.3. Sostanze tossiche per la riproduzione

4.2.3.1. Ai fini della classificazione e dell'etichettatura e sulla base delle attuali conoscenze queste sostanze sono suddivise in 3 categorie:

Categoria 1

Sostanze che danneggiano la fertilità negli esseri umani

Esistono prove sufficienti per stabilire un nesso causale tra l'esposizione umana alla sostanza e la riduzione di fertilità.

Sostanze che provocano effetti tossici sullo sviluppo

Esistono prove sufficienti per stabilire un nesso causale tra l'esposizione umana alla sostanza e successivi effetti tossici a livello di sviluppo della progenie.

Categoria 2

Sostanze che possono eventualmente danneggiare la fertilità umana:

Esistono prove evidenti per presumere che l'esposizione umana alla sostanza possa ridurre la fertilità sulla base di:

- Prove evidenti effettuati di fertilità ridotta in studi su animali in assenza di effetti tossici oppure prove di fertilità ridotta che si verifica a circa gli stessi livelli di dose di altri effetti tossici ma che non è una conseguenza secondaria non specifica di altri effetti tossici.
- Altre informazioni pertinenti.

Sostanze che possono provocare effetti tossici sullo sviluppo negli esseri umani

Esistono prove sufficienti per presumere che l'esposizione umana alla sostanza possa dar luogo a effetti tossici sullo sviluppo, sulla base in genere di:

- Risultati precisi in opportuni studi su animali dove gli effetti sono stati osservati in assenza di segni di pronunciata tossicità materna oppure all'incirca agli stessi livelli di dose di altri effetti tossici che non sono una conseguenza secondaria non specifica di altri effetti tossici.
- Altre informazioni pertinenti.

Categoria 3

Sostanze sospette per la fertilità umana:

In genere sulla base

- Risultati in appropriati studi su animali che forniscono sufficienti prove per avere un forte sospetto di una fertilità ridotta in assenza di effetti tossici oppure prove di fertilità ridotta che si verifica all'incirca agli stessi livelli di dose di altri effetti tossici ma che non è una conseguenza secondaria non specifica di altri effetti tossici e tuttavia le prove sono insufficienti per collocare la sostanza nella categoria 2.
- Altre informazioni pertinenti.

Sostanze sospette per gli esseri umani a causa di possibili effetti tossici sullo sviluppo
In genere sulla base di:

- Risultati in appropriati studi effettuati su animali che forniscono sufficienti prove per avere il forte sospetto di tossicità evolutiva in assenza di segni di pronunciata tossicità materna oppure circa agli stessi livelli di dose di altri effetti tossici ma che non sono una conseguenza secondaria non specifica di altri effetti tossici e tuttavia le prove sono insufficienti per collocare la sostanza nella categoria 2.
- Altre informazioni pertinenti.

4.2.3.2. Si applicano i simboli e le frasi specifiche di rischio seguenti:

Categoria 1:

Alle sostanze che danneggiano la fertilità umana:

T; R60: Può diminuire la fertilità.

Per sostanze che provocano effetti tossici sullo sviluppo:

T; R61: Può danneggiare i bambini non ancora nati.

Categoria 2:

Alle sostanze da considerare come riduttive della fertilità umana:

T; R60: Può diminuire la fertilità.

Alle sostanze che si considera possono provocare effetti tossici sullo sviluppo negli esseri umani.

T; R61: Può danneggiare i bambini non ancora nati.

Categoria 3

Alle sostanze sospette per la fertilità umana:

Xn; R62: Possibile rischio di ridotta fertilità.

Alle sostanze sospette per gli esseri umani a causa di possibili effetti tossici sullo sviluppo:

Xn; R63: Possibile rischio di danni ai bambini non ancora nati.

4.2.3.3. Osservazioni sulla classificazione di sostanze tossiche per la riproduzione.

La tossicità riproduttiva comprende diminuzione delle funzioni o della capacità di riproduzione maschile e femminile e il manifestarsi di effetti nocivi non ereditari sulla progenie. Questi effetti sono classificati in due rubriche principali: 1) effetti sulla fertilità maschile e femminile, 2) effetti tossici sullo sviluppo.

1. *Effetti sulla fertilità maschile o femminile.* Questa rubrica comprende effetti negativi sulla libido, sul comportamento sessuale, su qualsiasi aspetto di produzione di spermatozoi o di uova o sull'attività ormonale o la risposta fisiologica che possono interferire sulla capacità di fecondazione, la fecondazione stessa o lo sviluppo dell'uovo fecondato fino al momento dell'annidamento.

2. *Effetti tossici sullo sviluppo.* Nel senso più ampio del termine include ogni interferenza con lo sviluppo normale, prima o dopo la nascita. Comprende effetti indotti o manifestati a livello prenatale nonché quelli che si manifestano dopo la nascita, tra cui effetti embriotossici/fetotossici quali peso corporeo ridotto, ritardo nella crescita e nello sviluppo, tossicità organica, morte, aborto, difetti strutturali (effetti teratogeni), difetti funzionali, difetti peri-post-natali e sviluppo ritardato dopo la nascita a livello fisico o mentale fino allo sviluppo puberale normale compreso.

La classificazione di sostanze chimiche come tossiche per la riproduzione deve essere usata per le sostanze chimiche con caratteristiche intrinseche o specifiche atte a produrre tali effetti tossici. Le sostanze chimiche non devono essere classificate come tossiche per la riproduzione se tali effetti si manifestano soltanto come una conseguenza secondaria non specifica di altri effetti secondari. Le sostanze chimiche che causano maggiori preoccupazioni sono quelle tossiche per la riproduzione a livelli di esposizione che non producono altri segni di tossicità.

La collocazione di un composto nella categoria 1 per effetti sulla fertilità e/o per effetti tossici sullo sviluppo avviene sulla base di dati epidemiologici. La classificazione nelle categorie 2 o 3 avviene principalmente sulla base di dati sugli animali. I dati di studi *in vitro* o di studi su uova di pollo sono considerati come <prova di sostegno> e solo in casi eccezionali portano alla classificazione in mancanza di dati *in vivo*.

In linea con la maggior parte degli altri tipi di effetto tossico, le sostanze che dimostrano tossicità riproduttiva dovranno avere una soglia limite al di sotto della quale non sono dimostrati effetti negativi. Anche se in studi su animali sono stati dimostrati effetti precisi, la rilevanza per gli esseri umani può essere dubbia a causa delle dosi somministrate, ad esempio se gli effetti sono stati dimostrati soltanto a dosi elevate oppure se esistono marcate differenze tossico cinetiche o ancora le modalità di somministrazione non sono opportune. Per queste o simili ragioni, può succedere che si effettui la classificazione nella categoria 3 o addirittura nessuna classificazione.

L'allegato V della direttiva specifica una prova limite nel caso delle sostanze a bassa tossicità. Se un livello di dose di almeno 1000 mg/kg orale non produce prove di effetti tossici per la riproduzione, si può considerare che non siano necessari studi ad altri livelli di dose. Se i dati sono ricavati da studi effettuati con dosi superiori alla dose limite di cui sopra, questi dati devono essere valutati insieme ad altri dati pertinenti. In circostanze normali si considera che gli effetti osservati soltanto a dosi superiori alla dose limite non portino automaticamente alla classificazione di <tossico per la riproduzione>.

EFFETTI SULLA FERTILITA'

Per la classificazione di una sostanza nella categoria 2 per la riduzione della fertilità, di norma, devono esistere prove evidenti su una specie animale con prove supplementari sul meccanismo dell'azione o sul sito dell'azione oppure sul rapporto chimico rispetto ad altri agenti noti per la loro azione negativa sulla fertilità o ancora altre informazioni ricavate da essere umani che possano portare a concludere che probabilmente si avrebbero tali effetti negli esseri umani. Se esistono studi soltanto su una specie senza altre prove di sostegno pertinenti, può essere opportuna la classificazione nella categoria 3.

Dato che la diminuzione di fertilità può verificarsi come fenomeno parallelo e non specifico ad una grave tossicità diffusa nei casi di grave inanizione, la classificazione nella categoria 2 deve aver luogo soltanto se esistono prove che vi è un certo grado di specificità della tossicità per il sistema riproduttivo. Se è dimostrato che la diminuzione di fertilità negli studi su animali era dovuta ad un'incapacità di accoppiamento, per la classificazione nella categoria 2 di norma si dovranno avere prove sul meccanismo dell'azione per interpretare se qualsiasi effetto negativo, ad esempio l'alterazione nell'andamento del rilascio ormonale, potrebbe verificarsi negli esseri umani.

EFFETTI TOSSICI SULLO SVILUPPO

Per la classificazione nella categoria 2 occorrono prove precise di effetti negativi in studi correttamente effettuati su una o più specie. Dato che gli effetti negativi nella gravidanza o dopo la nascita possono verificarsi come conseguenza secondaria di tossicità materna, ingestione ridotta di alimenti o acqua, stress della madre, mancanza di cure materne, specifiche carenze dietetiche, gestione animale carente, infezioni intercorrenti ecc., è importante che gli effetti osservati si verifichino in studi svolti correttamente e a livelli di dose non associati con pronunciata tossicità.

materna. Sono anche importanti le modalità di esposizione, in particolare l'iniezione di materiale irritante intraperitoneale che può provocare danni localizzati all'utero e al suo contenuto e i risultati di tali studi devono essere interpretati con cautela senza portare di norma di per sé ad una classificazione.

La classificazione nella categoria 3 si basa su criteri simili a quelli per la categoria 2 ma può essere applicata se la progettazione delle prove presenta delle carenze che rendono le conclusioni meno convincenti oppure se vi è la possibilità che gli effetti siano dovuti a influenze non specifiche tali da non poter escludere la tossicità diffusa.

In generale la classificazione nella categoria 3 o la non classificazione sarà effettuata caso per caso quando gli unici effetti registrati siano piccole modifiche nell'incidenza di difetti spontanei, piccoli cambiamenti nelle proporzioni di varianti comuni quali si osservano negli esami dello scheletro o piccole differenze nelle valutazioni dello sviluppo post-natale.

Effetti durante la lattazione

Le sostanze classificate come tossiche per la riproduzione e sospette per i loro effetti sulla lattazione dovranno essere etichettate anche con R64 (cfr. criteri del punto 3.2.8).

A scopi di classificazione, gli effetti tossici sulla prole derivanti *soltanto* dall'esposizione attraverso il latte materno, oppure gli effetti tossici derivanti dall'*esposizione diretta* di bambini non saranno considerati <tossici per la riproduzione> a meno che tali effetti provochino ritardi di sviluppo nella prole.

Le sostanze che non sono classificate come tossiche per il ciclo riproduttivo ma sono sospette per la tossicità trasferita al lattante durante il periodo di lattazione dovrebbero essere etichettate con R64 (cfr. criteri al punto 3.2.8). Questa frase R può anche essere opportuna per sostanze che incidono sulla quantità o qualità del latte.

R64 sarà di norma assegnata in base a:

- a) studi tossicocinetici che indicano la probabilità che la sostanza sia presente a livelli potenzialmente tossici nel latte materno e/o
- b) risultati di uno o due studi generazionali su animali che indicano la presenza di effetti negativi sulla prole a causa del passaggio nel latte e/o
- c) prove sugli esseri umani che indicano un rischio per i bambini durante il periodo di allattamento.

Le sostanze note per il loro accumulo nel corpo e che quindi possono essere rilasciate nel latte durante l'allattamento possono essere etichettate con R33 e R64.

4.2.4. Procedura per la classificazione dei preparati riguardante gli effetti specifici sulla salute.

Qualora un preparato contenga una o più delle sostanze classificate in base ai criteri descritti in precedenza, deve essere classificato in conformità dei criteri di cui all'articolo 3 (5), lettere dal (j) a (q), del decreto ministeriale 28 gennaio 1992 (i limiti di concentrazione sono riportati nell'allegato I del decreto legislativo 3 febbraio 1997, n. 52 o nell'allegato I del decreto ministeriale 28 gennaio 1992 qualora la sostanza o le sostanze in esame non figurino nell'allegato I o vi figurino senza limiti di concentrazione).

5 CLASSIFICAZIONE IN BASE AGLI EFFETTI SULL'AMBIENTE

5.1. Introduzione

L'obiettivo principale della classificazione delle sostanze pericolose per l'ambiente è di sensibilizzare l'utilizzatore sui pericoli che tali sostanze presentano per gli ecosistemi. Sebbene i

presenti criteri si riferiscano sostanzialmente agli ecosistemi acquatici, è noto che talune sostanze possono danneggiare anche, o soltanto, altri ecosistemi i cui costituenti possono variare dalla microflora e microfauna del terreno fino ai primati.

I criteri descritti in appresso sono una conseguenza diretta dei metodi di prova stabiliti nell'allegato V per quanto ivi citati. I metodi di prova richiesti per il <fascicolo di base> di cui all'allegato VII sono limitati, e le informazioni così ottenute possono rilevarsi insufficienti per una classificazione adeguata, in quanto può essere necessario disporre di ulteriori dati ricavati dal livello 1 (allegato VIII) o da altri studi equivalenti. Inoltre, le sostanze classificate possono essere oggetto di revisione alla luce di nuovi dati.

Ai fini della classificazione e dell'etichettatura, e considerando le conoscenze attualmente disponibili, tali sostanze sono suddivise in due gruppi in base ai loro effetti, acuti e/o a lungo termine, sui sistemi acquatici o ai loro effetti acuti e/o a lungo termine sui sistemi non acquatici.

5.2. Criteri per la classificazione, l'indicazione di pericolo e la scelta delle frasi di rischio

5.2.1. Ambiente acquatico

5.2.1.1. Le sostanze saranno classificate come pericolose per l'ambiente, contrassegnate con il simbolo <N> e l'opportuna indicazione di pericolo e saranno attribuite le frasi di rischio in conformità dei seguenti criteri:

R50: Altamente tossico per gli organismi acquatici

e

R53: Può provocare a lungo termine effetti negativi per l'ambiente acquatico.

Tossicità acuta:

LC ₅₀ a 96 ore (per il pesce)	≤ 1 mg/l
o EC ₅₀ a 48 ore (per la Daphnia)	≤ 1 mg/l
o IC ₅₀ a 72 ore (per le alghe)	≤ 1 mg/l

e la sostanza non è facilmente degradabile

o il log Pow (log del coefficiente di ripartizione ottanolo/acqua) sia ≤ 3.0 (a meno che il BCF determinato per via sperimentale non sia ≤ 100)

R50: Altamente tossico per gli organismi acquatici.

Tossicità acuta:

LC ₅₀ a 96 ore (per il pesce)	≤ 1 mg/l
o EC ₅₀ a 48 ore (per la Daphnia)	≤ 1 mg/l
o IC ₅₀ a 72 ore (per le alghe)	≤ 1 mg/l

R51: Tossico per gli organismi acquatici.

e

R 53: Può provocare a lungo termine effetti negativi per l'ambiente acquatico.

Tossicità acuta:

LC ₅₀ a 96 ore (per il pesce)	1 mg/l < LD ₅₀ ≤ 10 mg/l
o EC ₅₀ a 48 ore (per la Daphnia)	1 mg/l < EC ₅₀ ≤ 10 mg/l
o IC ₅₀ a 72 ore (per le alghe)	1 mg/l < IC ₅₀ < 10 mg/l

e la sostanza non è facilmente degradabile

o il log Pow (log del coefficiente di ripartizione ottanolo/acqua) sia ≥ 3.0 (a meno che il BCF determinato per via sperimentale non sia ≤ 100)

5.2.1.2. Le sostanze saranno classificate come pericolose per l'ambiente in conformità dei criteri descritti in appresso. Le frasi indicanti i rischi sono attribuite anche sulla base dei seguenti criteri

R52: Nocivo per gli organismi acquatici

e

R 53: Può provocare a lungo termine effetti negativi per l'ambiente acquatico.

Tossicità acuta:	LC ₅₀ a 96 ore (per il pesce)	10 mg/l < LD ₅₀ ≤ 100 mg/l
o	EC ₅₀ a 48 ore (per la Daphnia)	10 mg/l < EC ₅₀ ≤ 100 mg/l
o	IC ₅₀ a 72 ore (per le alghe)	10 mg/l < IC ₅₀ ≤ 100 mg/l

e la sostanza non è facilmente degradabile.

Questo criterio viene applicato a meno che non esistano ulteriori prove scientifiche relative alla degradazione e/o alla tossicità che forniscano sufficienti garanzie che né la sostanza né i prodotti derivanti dalla sua degradazione costituiscano un pericolo potenziale a lungo termine e/o ritardato per l'ambiente acquatico. Tali ulteriori prove scientifiche dovrebbero normalmente basarsi sugli studi di cui al livello 1 (allegato VIII), o su studi di equivalente valore, e potrebbero comprendere:

- i) un potenziale accertato a degradare rapidamente nell'ambiente acquatico;
- ii) l'assenza di effetti tossici cronici ad una concentrazione di 1,0 mg/litro, ad esempio una concentrazione di effetti non osservati superiore ad 1,0 mg/litro determinata sulla base di uno studio prolungato di tossicità sul pesce o la Daphnia.

R52: Nocivo per gli organismi acquatici.

Sostanze che non rientrano nei criteri descritti in questo capitolo ma che, in base a prove disponibili sulla loro tossicità, possono tuttavia presentare un pericolo per la struttura e/o il funzionamento degli ecosistemi acquatici.

R53: Può provocare a lungo termine effetti negativi per l'ambiente acquatico.

Sostanze che non rientrano nei criteri descritti in questo capitolo, ma che, in base a prove disponibili concernenti la loro tossicità, persistenza, potenziale di accumulazione e destino e comportamento ambientale presunto o osservato, possono tuttavia presentare un pericolo immediato, a lungo termine e/o ritardato per la struttura e/o il funzionamento degli ecosistemi acquatici.

Per esempio, alle sostanze scarsamente solubili in acqua, vale a dire con una solubilità inferiore ad 1 mg/l, sarà applicato il suddetto criterio se:

- a) non sono facilmente degradabili e
- b) il log Pow ≥ 3,0 (a meno che il BCF determinato per via sperimentale non sia ≤ 100)

Si applica il suddetto criterio a meno che non esistano ulteriori prove scientifiche relative alla degradazione e/o tossicità sufficienti a garantire che la sostanza e i prodotti derivanti dalla sua degradazione non costituiranno un pericolo potenziale a lungo termine e/o ritardato per l'ambiente acquatico.

Tali prove scientifiche supplementari dovranno normalmente basarsi sugli studi di cui al livello 1 (allegato VIII) o su studi analoghi, e potrebbero comprendere:

- i) un potenziale accertato di degradazione rapida nell'ambiente acquatico;
- ii) l'assenza di effetti tossici cronici al limite di solubilità, vale a dire una concentrazione di effetti non osservati superiore al limite di solubilità determinato sulla base di uno studio di tossicità prolungato sul pesce o Daphnia.

5.2.1.3. Osservazioni sulla determinazione del IC₅₀ per le alghe e la degradabilità.

- Se si può dimostrare, nel caso di sostanze fortemente colorate che la crescita di alghe è inibita soltanto a seguito di una riduzione dell'intensità della luce, non usare come base per la classificazione il valore 72h IC₅₀ per le alghe

- Le sostanze sono considerate facilmente degradabili se valgono i seguenti criteri:
 - (A) se negli studi di biodegradazione di 28 giorni si raggiungono i seguenti livelli di degradazione:
 - nelle prove basate sul carbonio organico disciolto: 70%
 - nelle prove basate sull'impoverimento dell'ossigeno o sulla formazione di anidride carbonica: 60 % dei valori massimi teorici.
 - Questi livelli di biodegradazione devono essere raggiunti entro 10 giorni dall'inizio del processo di degradazione, considerato come il momento in cui il 10% della sostanza è stato degradato;
 - o
 - (B) se nei casi in cui siano disponibili solo i dati relativi al COD e al BOD5, qualora il rapporto tra BOD5 e COD sia maggiore o uguale a 0,5.
 - o
 - (B) se esistono altre prove scientifiche fondate a dimostrazione che la sostanza può essere degradata (in maniera biotica e/o abiotica), nell'ambiente acquatico a un livello > 70% in un periodo di 28 giorni.

5.2.2. Ambiente non acquatico

- 5.2.2.1. Le sostanze saranno classificate come pericolose per l'ambiente, contrassegnate con il simbolo <N> e l'opportuna indicazione di pericolo e saranno attribuite frasi di rischio in conformità dei criteri qui di seguito.

R54 Tossico per la flora

R55 Tossico per la fauna

R56 Tossico per gli organismi del terreno

R57 Tossico per le api

R58 Può provocare a lungo termine effetti negativi per l'ambiente

Sostanze che in base alle prove disponibili relative alla loro tossicità, persistenza, potenziale di accumulazione e destino e comportamento ambientale presunto o osservato, possono presentare un pericolo immediato, a lungo termine e/o ritardato per la struttura e/o il funzionamento degli ecosistemi naturali, esclusi quelli descritti al punto 5.2.1. I criteri dettagliati saranno elaborati in seguito.

R59 Pericoloso per lo strato di ozono

Sostanze che in base a prove disponibili concernenti la loro tossicità, persistenza, potenziale di accumulazione e destino e comportamento ambientale presunto o osservato, possono presentare un pericolo immediato, a lungo termine e/o ritardato per la struttura e/o il funzionamento dello strato di ozono della stratosfera, comprese le sostanze elencate nell'allegato I, gruppi I, II, III, IV e V del regolamento del Consiglio (CEE) n. 594/91 relativo a sostanze che riducono lo strato di ozono (GU n. L 67 del 14.3.1991, pag. 1).

- 5.2.2.2. Le sostanze verranno classificate pericolose per l'ambiente conformemente ai criteri precisati qui di seguito. Le frasi di rischio saranno inoltre assegnate conformemente ai seguenti criteri:

R59 Pericoloso per lo strato di ozono

Sostanze che non rientrano nei criteri elencati al punto 5.2.2.1 e che in base ai dati disponibili riguardanti le loro proprietà ed il loro comportamento ambientale, previsto o osservato, possono presentare un pericolo per la struttura e/o il funzionamento dello strato stratosferico di ozono. Sono comprese le sostanze che sono elencate nell'allegato I, gruppi VI del regolamento del Consiglio (CEE) n. 594/91 relativo a sostanze che riducono lo strato di ozono (GU n. L 67 del 14.3.1991, pag. 1).

6. SCELTA DELLE FRASI RELATIVE AI CONSIGLI DI PRUDENZA

6.1. Introduzione

Le frasi relative ai consigli di prudenza (frasi S) saranno assegnate alle sostanze ed ai preparati pericolosi in conformità dei seguenti criteri generali. Per alcuni preparati inoltre, sono obbligatori i consigli di prudenza descritti nell'allegato II del decreto ministeriale 28 gennaio 1992.

Ogniqualevolta il fabbricante è menzionato nel capitolo 6, si fa riferimento alla persona responsabile dell'immissione sul mercato della sostanza o del preparato.

6.2. Frasi relative ai consigli di prudenza per le sostanze e i preparati

S1 *Conservare sotto chiave*

- Campo d'applicazione:
 - Sostanze e preparati molto tossici, tossici e corrosivi.
- Criteri d'impiego:
 - Obbligatoria per le sostanze e i preparati sopra menzionati se in vendita al dettaglio.

S2 *Conservare fuori dalla portata dei bambini*

- Campo d'applicazione:
 - Tutte le sostanze e i preparati pericolosi.
- Criteri d'impiego:
 - Obbligatoria per tutte le sostanze e i preparati pericolosi in vendita al dettaglio, eccezion fatta per quelli soltanto classificati pericolosi per l'ambiente.

S3 *Conservare il luogo fresco*

- Campo d'applicazione:
 - Perossidi organici
 - Altre sostanze e preparati pericolosi con punto di ebollizione di $\leq 40^{\circ}\text{C}$.
- Criteri d'impiego:
 - Obbligatoria per i perossidi organici, a meno che si usi la frase S 47.
 - Raccomandata per le altre sostanze e preparati pericolosi che hanno un punto di ebollizione di $\leq 40^{\circ}\text{C}$.

S4 *Conservare lontano da locali di abitazione*

- Campo d'applicazione:

- Sostanze e preparati molto tossici e tossici.
 - Criteri d'impiego:
 - Di norma limitata alle sostanze ed ai preparati molto tossici e tossici, nei casi in cui è opportuno rafforzare la frase S13, ad esempio quando esiste un pericolo di inalazione e quindi occorre conservare la sostanza o il preparato lontano da locali di abitazione. Il consiglio non ha però lo scopo di impedire la corretta utilizzazione della sostanza o del preparato nei locali di abitazione.
- S5 *Conservare sotto...* (liquido appropriato da indicarsi da parte del fabbricante)
- Campo d'applicazione:
 - Sostanze e preparati solidi infiammabili spontaneamente.
 - Criteri d'impiego:
 - Di norma limitata a casi particolari, ad esempio sodio, potassio o fosforo bianco.
- S6 *Conservare sotto...* (gas inerte da indicarsi da parte del fabbricante)
- Campo d'applicazione:
 - Sostanze e preparati pericolosi che devono essere conservati in un'atmosfera inerte.
 - Criteri d'impiego:
 - Di norma limitata ad alcuni casi particolari, ad esempio alcuni composti organo-metallici.
- S7 *Conservare il recipiente ben chiuso*
- Campo d'applicazione
 - Perossidi organici.
 - Sostanze e preparati che possono sprigionare gas molto tossici, tossici, o estremamente infiammabili.
 - Sostanze e preparati che a contatto con l'umidità sprigionano gas estremamente infiammabili.
 - Solidi facilmente infiammabili.
 - Criteri d'impiego:
 - Obbligatoria per i perossidi organici.
 - Raccomandata per gli altri campi d'applicazione summenzionati.
- S8 *Conservare al riparo dall'umidità*
- Campo d'applicazione:
 - Sostanze e preparati che possono reagire violentemente con l'acqua.
 - Sostanze e preparati che a contatto con l'acqua sprigionano gas estremamente infiammabili.
 - Sostanze e preparati che a contatto con l'acqua sprigionano gas molto tossici o tossici.

- Criteri d'impiego:
 - Di norma limitata ai summenzionati campi d'applicazione, quando si vogliono sottolineare le avvertenze contenute nelle frasi R14, R15 in particolare e R29.

S9 *Conservare il recipiente in luogo ben ventilato*

- Campo d'applicazione:
 - Sostanze e preparati volatili che possono sprigionare vapori molto tossici, tossici o nocivi.
 - Liquidi estremamente o facilmente infiammabili e gas estremamente infiammabili.
- Criteri d'impiego:
 - Raccomandata per le sostanze e i preparati volatili che possono sprigionare vapori molto tossici, tossici o nocivi.
 - Raccomandata per i liquidi estremamente o facilmente infiammabili o per i gas estremamente infiammabili.

S12 *Non chiudere ermeticamente il recipiente*

- Campo d'applicazione:
 - Sostanze e preparati che possono sprigionare gas o vapori in grado di provocare la rottura dell'imballaggio.
- Criteri d'impiego:
 - Di norma limitata ai casi particolari summenzionati.

S13 *Conservare lontano da alimenti o mangimi e da bevande*

- Campo d'applicazione:
 - Sostanze e preparati molto tossici, tossici e nocivi.
- Criteri d'impiego:
 - Raccomandata per le sostanze e i preparati venduti al dettaglio.

S14 *Conservare lontano da...* (sostanze incompatibili da precisare da parte del produttore)

- Campo d'applicazione:
 - Perossidi organici..
- Criteri d'impiego:
 - *Obbligatoria* e di norma limitata ai perossidi organici. Tuttavia può essere utile in casi eccezionali, quando l'incompatibilità può dar luogo ad un rischio particolare.

S15 *Conservare lontano dal calore*

- Campo d'applicazione:

- Sostanze e preparati che possono decomporsi o che possono reagire spontaneamente sotto l'effetto del calore.
- Criteri d'impiego:
 - Di norma limitata a casi speciali, ad esempio monomeri, ma non utilizzata se sono state impiegate le frasi relative ai rischi R2, R3 e/o R5.

S16 Conservare lontano da fiamme e scintille - non fumare

- Campo d'applicazione:
 - Liquidi estremamente o facilmente infiammabili e gas estremamente infiammabili.
- Criteri d'impiego:
 - Raccomandata per le anzidette sostanze e preparati; non è tuttavia necessaria se sono già state utilizzate le frasi relative ai rischi R2, R3 e/o R5.

S17 Tenere lontano da sostanze combustibili

- Campo d'applicazione:
 - Sostanze e preparati che possono sviluppare un'eccessiva pressione nel contenitore.
- Criteri d'impiego:
 - Da utilizzare in casi particolari, ad esempio per sottolineare il contenuto delle frasi R8 e R9.

S18 Manipolare ed aprire il recipiente con cautela

- Campo d'applicazione:
 - Sostanze e preparati che possono sviluppare un'eccessiva pressione nel contenitore.
 - Sostanze e preparati che possono formare perossidi esplosivi.
- Criteri d'impiego:
 - Di norma limitata ai casi summenzionati, quando sussiste un pericolo di lesione agli occhi e/o quando le sostanze e i preparati sono venduti al dettaglio.

S20 Non mangiare né bere durante l'impiego

- Campo d'applicazione:
 - Sostanze e preparati molto tossici, tossici e corrosivi.
- Criteri d'impiego:
 - Di norma limitata a casi particolari (arsenico e composti dell'arsenico, fluoroacetati), in particolare quando le anzidette sostanze e preparati sono venduti al dettaglio.

S21 Non fumare durante l'impiego

- Campo d'applicazione:
 - Sostanze e preparati che, in caso di combustione, sprigionano prodotti tossici.
- Criteri d'impiego:

- Di norma limitata a casi particolari (ad esempio composti alogenati).

S22 Non respirare le polveri

- Campo d'applicazione:
 - Tutte le sostanze e i preparati solidi pericolosi per la salute
- Criteri d'impiego:
 - **Obbligatoria** per le sostanze e i preparati sopramenzionati ai quali è assegnata la R42.
 - **Raccomandata** per le sostanze e preparati di cui sopra, forniti sotto forma di polveri respirabili e per i quali non si conoscono i rischi per la salute a seguito dell'inalazione.

S23 Non respirare i gas/fumi/vapori/aerosoli [dicitura appropriata da precisare da parte del produttore]

- Campo d'applicazione:
 - Tutte le sostanze e i preparati liquidi o gassosi pericolosi per la salute.
- Criteri d'impiego:
 - **Obbligatoria** per le sostanze e i preparati sopra menzionati, ai quali è assegnata la frase R42.
 - **Obbligatoria** per le sostanze e i preparati per uso a spruzzo. Aggiungere inoltre S38 o S51.
 - **Raccomandata** quando occorre richiamare l'attenzione dell'utilizzatore sui pericoli di inalazione non menzionati nelle frasi di rischio assegnate.

S24 Evitare il contatto con la pelle

- Campo d'applicazione:
 - Tutte le sostanze e i preparati pericolosi per la salute
- Criteri d'impiego:
 - **Obbligatoria** per le sostanze e i preparati cui è stata assegnata R43 tranne se è stata anche assegnata S36.
 - **Raccomandata** quando occorre richiamare l'attenzione dell'utilizzatore sui pericoli che comporta il contatto con la pelle, non menzionati nelle frasi di rischio assegnate. Tuttavia, può essere utilizzata per dare maggior risalto a tali frasi di rischio.

S25 Evitare il contatto con gli occhi

- Campo d'applicazione:
 - Sostanze e preparati corrosivi o irritanti.
- Criteri d'impiego:
 - Di norma limitata a casi speciali, cioè quando si reputa essenziale porre in risalto il pericolo per gli occhi indicato dall'impiego delle frasi R34, R35, R36 o R41. Quindi va considerata importante se le sostanze e i preparati sono venduti al dettaglio e non è sempre disponibile una protezione per gli occhi o il volto.

S26 *In caso di contatto con gli occhi, lavare immediatamente ed abbondantemente con acqua e consultare un medico*

- Campo d'applicazione:
 - Sostanze e preparati corrosivi o irritanti.
- Criteri d'impiego:
 - *Obbligatoria* per le sostanze e i preparati corrosivi e quelli ai quali viene assegnata la frase di rischio R41.
 - Raccomandata per le sostanze e i preparati irritanti ai quali è già stata assegnata la frase di rischio R36.

S27 *Togliersi di dosso immediatamente gli indumenti contaminati*

- Campo d'applicazione:
 - Sostanze e preparati molto tossici, tossici o corrosivi.
- Criteri d'impiego:
 - Raccomandata per le sostanze e i preparati molto tossici e tossici che sono facilmente assorbiti dalla pelle e per le sostanze e i preparati corrosivi. Non usare questa frase se è stata assegnata S36.

S28 *In caso di contatto con la pelle lavarsi immediatamente e abbondantemente con ... (prodotti idonei da precisare dal fabbricante)*

- Campo d'applicazione:
 - Sostanze e preparati molto tossici, tossici o corrosivi.
- Criteri d'impiego:
 - *Obbligatoria* per le sostanze e i preparati molto tossici.
 - Raccomandata per altre sostanze e preparati sopra menzionati, in particolare quando l'acqua non rappresenta il fluido di lavaggio più appropriato.

S29 *Non gettare i residui nelle fognature*

- Campo d'applicazione:
 - Liquidi estremamente o facilmente infiammabili non miscibili con l'acqua.
- Criteri d'impiego:
 - Raccomandata per le sostanze e i preparati di cui sopra venduti al dettaglio.

S30 *Non versare acqua sul prodotto*

- Campo d'applicazione:
 - Sostanze e preparati che reagiscono violentemente a contatto con l'acqua.
- Criteri d'impiego:
 - Di norma limitata a casi particolari (ad esempio acido solforico); può essere utilizzata all'occorrenza, per rendere più chiare le informazioni o per sottolineare la frase R14 o come alternativa alla R14.

S33 Evitare l'accumulo di cariche elettrostatiche

- Campo d'applicazione:
 - Sostanze e preparati estremamente o facilmente infiammabili.
- Criteri d'impiego:
 - Raccomandata per le sostanze e i preparati utilizzati in campo industriale che non assorbono umidità. Praticamente non viene mai utilizzata per le sostanze e i preparati venduti al dettaglio.

S35 Non distaccare il prodotto e del recipiente se non con le dovute precauzioni

- Campo d'applicazione:
 - Sostanze e preparati esplosivi.
 - Sostanze e preparati molto tossici e tossici.
 - Sostanze pericolose per l'ambiente.
- Criteri d'impiego:
 - Obbligatoria per le sostanze e i preparati esplosivi diversi dai perossidi organici.
 - Raccomandata per sostanze e preparati molto tossici, in particolare se venduti al dettaglio.
 - Raccomandata per le sostanze pericolose per l'ambiente cui non si applica S56 se dette sostanze sono vendute al dettaglio.

S36 Usare indumenti protettivi adatti

- Campo d'applicazione:
 - Perossidi organici.
 - Sostanze e preparati molto tossici, tossici o nocivi.
 - Sostanze e preparati corrosivi.
- Criteri d'impiego:
 - Obbligatoria per le sostanze e i preparati molto tossici e corrosivi.
 - Obbligatoria per le sostanze e i preparati cui non sono state assegnate R21 o R24.
 - Obbligatoria per le sostanze cancerogene, mutagene e tossiche per la riproduzione di categoria 3 tranne se gli effetti sono prodotti soltanto mediante inalazione della sostanze o del preparato.
 - Obbligatoria per i perossidi organici.
 - Raccomandata per le sostanze tossiche e i preparati se il valore dermale LD₅₀ non è noto ma la sostanza o il preparato possono rivelarsi tossici a contatto con la pelle.
 - Raccomandata per sostanze e preparati usati nell'industria, atti a provocare danni per la salute in caso di esposizione prolungata.

S37 Usare guanti adatti

- Campo d'applicazione:
 - Sostanze e preparati molto tossici, tossici, nocivi o corrosivi.
 - Perossidi organici.
 - Sostanze e preparati irritanti per la pelle.
- Criteri d'impiego:
 - *Obbligatoria* per le sostanze e i preparati molto tossici, tossici e corrosivi.
 - *Obbligatoria* per le sostanze e i preparati cui non sono state assegnate R21, R24 o R43.
 - *Obbligatoria* per le sostanze cancerogene, mutagene e tossiche per la riproduzione di categoria 3 tranne se gli effetti sono prodotti unicamente mediante inalazione della sostanza o del preparato.
 - Raccomandata per sostanze e preparati tossici se il valore dermale LD₅₀ non è noto ma la sostanza o il preparato possono rivelarsi tossici a contatto con la pelle.
 - Raccomandata per i perossidi organici.
 - Raccomandata per sostanze e preparati irritanti per la pelle a causa delle loro proprietà sgrassanti.

S38 *In caso di ventilazione insufficiente, usare un apparecchio respiratorio adatto.*

- Campo d'applicazione:
 - Sostanze e preparati molto tossici o tossici.
- Criteri d'impiego:
 - Di norma limitata a casi particolari, che richiedono l'impiego di sostanze e preparati molto tossici o tossici in campo industriale o agricolo.

S39 *Proteggersi gli occhi/la faccia*

- Campo d'applicazione:
 - Perossidi organici.
 - Sostanze e preparati corrosivi, inclusi gli irritanti che comportano un grave pericolo di lesioni degli occhi.
 - Sostanze e preparati molto tossici e tossici.
- Criteri d'impiego:
 - *Obbligatoria* per sostanze e preparati cui sono state assegnate R34, R35 o R41.
 - *Obbligatoria* per i perossidi organici.
 - Raccomandata quando occorre richiamare l'attenzione dell'utilizzatore per i rischi di contatto per gli occhi non menzionati nelle frasi di rischio assegnate.
 - Di norma limitata a casi eccezionali per sostanze e preparati molto tossici e tossici quando esiste pericolo di spruzzi che potrebbero essere facilmente assorbiti dalla pelle.

S40 *Per pulire il pavimento e gli oggetti contaminati da questo prodotto usare... (da precisare da parte del produttore)*

- Campo d'applicazione:
 - Tutte le sostanze e i preparati pericolosi.
- Criteri d'impiego:
 - Di norma limitata a quelle sostanze e preparati pericolosi per i quali l'acqua non è considerata un mezzo adeguato di lavaggio (ad esempio quando occorre un assorbimento mediante sostanza polverulenta, dissoluzione mediante solvente, ecc.) e nei casi in cui è importante, per motivi sanitari e/o di sicurezza, riportare sull'etichetta un avvertimento.

S41 *In caso di incendio e/o esplosione non respirare i fumi*

- Campo d'applicazione:
 - Sostanze e preparati pericolosi che durante la combustione sprigionano gas molto tossici o tossici.
- Criteri d'impiego:
 - Di norma limitata a casi particolari.

S42 *Durante le fumigazioni/vaporizzazioni usare un apparecchio respiratorio adatto [termine(i) appropriato(i) da precisare da parte del produttore]*

- Campo d'applicazione:
 - Sostanze e preparati destinati alle utilizzazioni summenzionate ma che possono pregiudicare la sicurezza e la salute dell'utilizzatore quando non siano prese opportune precauzioni.
- Criteri d'impiego:
 - Di norma limitata a casi particolari.

S43 *In caso d'incendio usare...(mezzi estinguenti idonei da indicarsi da parte del fabbricante). Se l'acqua aumenta il rischio precisare: <Non usare acqua>.*

- Campo d'applicazione:
 - Sostanze e preparati estremamente infiammabili, facilmente infiammabili o infiammabili.
- Criteri d'impiego:
 - Obbligatoria per le sostanze e i preparati che a contatto con l'acqua o l'aria umida sprigionano gas estremamente infiammabili.
 - Raccomandata per sostanze e preparati estremamente infiammabili, facilmente infiammabili e infiammabili, in particolare quando non sono miscibili con acqua.

S45 *In caso di incidente o di malessere consultare immediatamente il medico (se possibile, mostrargli l'etichetta)*

- Campo d'applicazione:
 - Sostanze e preparati molto tossici.

- Sostanze e preparati tossici e corrosivi.
 - Criteri d'impiego:
 - *Obbligatoria per sostanze e preparati citati qui sopra.*
- S46** *In caso di ingestione consultare immediatamente il medico e mostrargli il contenitore o l'etichetta.*
- Campo d'applicazione:
 - Tutte le sostanze e i preparati pericolosi diversi da quelli molto tossici, tossici, corrosivi o pericolosi per l'ambiente.
 - Criteri d'impiego:
 - *Obbligatoria per tutte le sostanze e i preparati summenzionati venduti al dettaglio a meno che non vi sia motivo di ritenere pericolosa l'ingestione, in particolare da parte dei bambini.*
- S47** *Conservare a temperatura non superiore a ... °C (da precisare da parte del fabbricante)*
- Campo d'applicazione:
 - Sostanze e preparati che diventano instabili ad una certa temperatura.
 - Criteri d'impiego:
 - Di norma limitata a casi particolari (ad esempio alcuni perossidi organici).
- S48** *Mantenere umido con ... (liquido appropriato da precisare da parte del fabbricante)*
- Campo d'applicazione:
 - Sostanze e preparati che possono diventare molto sensibili alle scintille, a frizione o agli urti qualora si asciugano.
 - Criteri d'impiego:
 - Di norma limitata a casi speciali, ad esempio nitrocellulosa.
- S49** *Conservare soltanto nel recipiente originale*
- Campo d'applicazione:
 - Sostanze e preparati sensibili alla decomposizione catalitica.
 - Criteri d'impiego:
 - Di norma limitata alle sostanze e ai preparati sensibili alla decomposizione catalitica (ad esempio alcuni perossidi organici).
- S50** *Non mescolare con ... (da specificare da parte del fabbricante)*
- Campo d'applicazione:
 - Sostanze e preparati che possono reagire con i prodotti specificati e liberare gas molto tossici o tossici.
 - Perossidi organici.
 - Criteri d'impiego:

- **Raccomandata** per le sostanze e i preparati anzidetti venduti al dettaglio, nei casi in cui questa frase è preferibile alla R31 o alla R32.
- **Obbligatoria** per alcuni perossidi che possono provocare una violenta reazione con acceleratori o promotori.

S51 Usare soltanto in luogo ventilato

- **Campo d'applicazione:**
 - **Sostanze e preparati** che potrebbero o che devono produrre vapori, polveri, spray, fumi, nebbia, ecc., e che comportano pericolo di inalazione o di incendio o di esplosione.
- **Criteri d'impiego:**
 - **Raccomandata** quando non risulti opportuno l'uso della S38; è quindi importante quando le sostanze e i preparati sono venduti al dettaglio.

S52 Non utilizzare su grandi superfici in locali abitati.

- **Campo d'applicazione:**
 - **Sostanze volatili** molto tossiche, tossiche e nocive, e preparati che le contengono.
- **Criteri d'impiego:**
 - **Raccomandata** quando la prolungata esposizione a queste sostanze può provocare un danno alla salute, a causa della loro volatilizzazione da ampie superfici trattate in ambienti domestici o comunque in ambienti chiusi in cui è possibile la presenza di persone.

S53 Evitare l'esposizione - procurarsi speciali istruzioni prima dell'uso

- **Campo d'applicazione:**
 - **Sostanze e preparati** cancerogeni, mutageni e/o tossici per la riproduzione.
- **Criteri d'impiego:**
 - **Obbligatoria** per le sostanze e i preparati summenzionati cui è assegnata almeno una delle frasi R45, R46, R49, R60 o R61.

S56 Smaltire questo materiale e i relativi contenitori in un punto di raccolta rifiuti pericolosi o speciali

- **Campo d'applicazione:**
 - **Sostanze pericolose** per l'ambiente.
- **Criteri d'impiego:**
 - **Raccomandata** per le sostanze cui è stato assegnato il simbolo <N> e in genere vedute al dettaglio.

S57 Usare contenitori adeguati per evitare l'inquinamento ambientale

- **Campo d'applicazione:**
 - **Sostanze** cui è stato assegnato il simbolo > N >.
- **Criteri d'impiego:**

- Limitata di norma alle sostanze in genere non vendute al dettaglio.

S59 Richiedere informazioni al produttore o fornitore per il recupero/riciclaggio

- Campo d'applicazione:
 - Sostanze pericolose per l'ambiente.
- Criteri d'impiego:
 - *Obbligatoria* per le sostanze pericolose per lo strato di ozono.
 - *Raccomandata* per altre sostanze cui è stato assegnato il simbolo <N> e per cui si raccomanda il recupero o il riciclo.

S60 Questo materiale e il suo contenitore devono essere smaltiti come rifiuti pericolosi

- Campo d'applicazione:
 - Sostanze pericolose per l'ambiente.
- Criteri d'impiego:
 - *Raccomandata* per le sostanze cui è stato assegnato il simbolo <N> in genere non venduta al dettaglio.

S61 Non disperdere nell'ambiente. Riferirsi alle istruzioni speciali/schede informative in materia di sicurezza.

- Campo d'applicazione:
 - Sostanze pericolose per l'ambiente.
- Criteri d'impiego:
 - Usata di norma per le sostanze cui è stato assegnato il simbolo <N>.
 - *Raccomandata* per tutte le sostanze classificate pericolose per l'ambiente e non contemplate sopra.

S62 In caso di ingestione, non provocare il vomito; consultare immediatamente un medico e mostrargli il contenitore o l'etichetta.

- Campo d'applicazione:
 - Sostanze e preparati classificati come nocivi e caratterizzati dalla frase R65 conformemente ai criteri di cui al punto 3.2.3.
 - Non applicabile alle sostanze e ai preparati immessi in commercio in bombolette aerosol o in recipienti muniti di un dispositivo sigillato di nebulizzazione; cfr. sezioni 8 e 9.
- Criteri d'impiego:
 - *Obbligatoria* per le sostanze e i preparati di cui sopra, destinati alla libera vendita o che possono essere utilizzati dal pubblico.
 - *Raccomandato* per le sostanze e i preparati di cui sopra utilizzati nell'industria.

7. ETICHETTATURA

- 7.1. Dopo che una sostanza o un preparato sono stati classificati, l'etichetta adeguata viene determinata in conformità delle disposizioni dell'articolo 16 del decreto legislativo 3 febbraio 1997, n. 52 e dell'articolo 7 del decreto ministeriale 28 gennaio 1992 per le sostanze ed i preparati rispettivamente. Il presente capitolo illustra come si definisce l'etichetta ed in particolare serve da guida per la scelta delle frasi di rischio ed i consigli di prudenza più adeguati.

L'etichetta contiene le informazioni seguenti:

- a) denominazione/i delle sostanze che figureranno sull'etichetta;
- b) nome e indirizzo completi, compreso il numero di telefono, del fabbricante/importatore;
- c) simboli e indicazioni di pericolo;
- d) frasi indicanti rischi specifici (frasi R);
- e) frasi indicanti i consigli di prudenza (frasi S);
- f) per le sostanze, il numero CEE.

- 7.1.1. Per le sostanze che figurano nell'allegato I del decreto legislativo 3 febbraio 1997, n. 52, l'etichetta comprende anche le parole <etichetta CEE>.

- 7.1.2. Scelta finale delle frasi di rischio e di prudenza.

Anche se la scelta finale delle frasi di rischio e di prudenza più opportune sarà determinata soprattutto dalla necessità di fornire tutte le informazioni necessarie, si dovrà tener conto anche della chiarezza e dell'effetto dell'etichetta. Per mantenere la chiarezza, le informazioni necessarie devono essere espresse con un numero minimo di frasi.

Per le sostanze e i preparati irritanti, facilmente infiammabili, infiammabili e comburenti, non è necessaria l'indicazione delle frasi R e S se il contenuto dell'imballaggio non supera i 125 ml. Lo stesso vale per le sostanze nocive che, in imballaggi di pari contenuto, non sono poste in vendita al dettaglio.

- 7.1.3. Indicazioni quali <Non tossico>, <Non nocivo> o qualsiasi altra indicazione analoga non possono figurare sull'etichetta o sull'imballaggio delle sostanze o dei preparati disciplinati dal decreto legislativo 3 febbraio 1997, n. 52 e dal decreto ministeriale 28 gennaio 1992.

- 7.1.4. Per alcuni preparati, l'allegato II del decreto ministeriale 28 gennaio 1992 prevede disposizioni speciali di etichettatura.

7.2. Denominazione chimica da indicare sull'etichetta:

- 7.2.1. Per le sostanze elencate nell'allegato II del decreto legislativo 3 febbraio 1997, n. 52 l'etichetta deve indicare il nome delle sostanze secondo una delle designazioni di cui all'allegato I.

Per le sostanze non ancora elencate nell'allegato I la denominazione è stabilita secondo una nomenclatura chimica riconosciuta a livello internazionale, come definito al punto 1.4 precedente.

- 7.2.2. Per i preparati, la scelta delle denominazioni che devono figurare sull'etichetta segue le norme di cui all'articolo 7, paragrafo 1 lettera c) del decreto ministeriale 28 gennaio 1992.

Nota:

Nel caso di preparati concentrati destinati all'industria profumiera:

- la persona responsabile della loro immissione sul mercato può specificare semplicemente l'unica sostanza sensibilizzante che ritiene essere la causa principale del pericolo di sensibilizzazione;
- nel caso di una sostanza naturale, la denominazione chimica può essere: <olio essenziale di ...>, <estratto di ...>, piuttosto che la denominazione dei componenti di tale olio o estratto essenziale.

7.3. Scelta dei simboli di pericolo

I simboli di pericolo e la dicitura delle indicazioni di pericolo devono essere conformi a quanto specificato nell'allegato II. Il simbolo deve essere stampato in nero su fondo giallo arancione.

7.3.1. Per le sostanze che figurano nell'allegato I, i simboli e le indicazioni di pericolo sono quelli indicati nell'allegato.

7.3.2. Per le sostanze che non figurano ancora nell'allegato I e per i preparati pericolosi, i simboli e le indicazioni di pericolo sono assegnati conformemente alle norme stabilite nel presente allegato.

Quando ad una sostanza sono assegnati più simboli:

- l'obbligo di apporre il simbolo T rende facoltativi i simboli X e C;
- l'obbligo di apporre il simbolo C rende facoltativo il simbolo X;
- l'obbligo di apporre il simbolo E rende facoltativi i simboli F e O.

7.4. Scelta delle frasi di rischio

Il testo delle frasi R deve corrispondere a quello riportato nell'allegato III del decreto legislativo 3 febbraio 1997, n. 52.

Usare ove applicabile le frasi R combinate nell'allegato III.

7.4.1. Per le sostanze che figurano nell'allegato I, le frasi R sono quelle indicate in allegato.

7.4.2. Per le sostanze che non figurano nell'allegato I, le frasi R sono scelte in base ai criteri e alle priorità seguenti:

a) in caso di pericoli di effetti sulla salute:

- i) le frasi R corrispondenti alla categoria di pericolo identificata da un simbolo devono figurare sull'etichetta;
- ii) le frasi R corrispondenti ad altre categorie di pericolo che non sono identificate da un simbolo conformemente all'articolo 20 del decreto legislativo 3 febbraio 1997, n. 52

b) in caso di pericolo derivante dalle proprietà fisico-chimiche:

- si applicano i criteri di cui al punto 7.4.2, lettera a), salvo il caso delle frasi di rischio <estremamente infiammabile> o <facilmente infiammabile> che non occorre riportare quando ripetono la dicitura delle indicazioni di pericolo usata con un simbolo;

c) in caso di pericolo per l'ambiente:

- le frasi R corrispondenti alla categoria <pericoloso per l'ambiente> devono figurare sull'etichetta.

7.4.3. Per i preparati, le frasi R saranno scelte secondo i criteri e le priorità qui di seguito:

a) in caso di pericolo per la salute:

- i) le frasi R corrispondenti alla categoria di pericolo identificata da un simbolo. In alcuni casi le frasi R devono essere adattate in conformità delle tabelle di cui all'allegato I del decreto ministeriale 28 gennaio 1992. In particolare, le frasi R relative al/ai componente/i che hanno determinato l'attribuzione del preparato alla categoria di pericolo devono figurare sull'etichetta;
- ii) le frasi R corrispondenti alle altre categorie di pericolo attribuite ai componenti ma che non sono contrassegnate da un simbolo conformemente all'articolo 7, lettera d) del decreto ministeriale 28 gennaio 1992.

b) in caso di pericolo derivante dalle proprietà fisico-chimiche:

- si applicano i criteri di cui al punto 7.4.3, lettera a), salvo in caso delle frasi <estremamente infiammabile> o <facilmente infiammabile> che non occorre indicare quando ripetono la dicitura dell'indicazione di pericolo utilizzata con il simbolo.

In linea generale, per i preparati saranno sufficienti al massimo 4 frasi R per descrivere i rischi. In particolare le combinazioni di frasi elencate nell'allegato III sono considerate come una sola frase. Le frasi standard devono tuttavia comprendere tutti i rischi principali connessi con il preparato.

Se tuttavia il fabbricante ritiene necessario precisare i rischi per l'ambiente si devono aggiungere ulteriori frasi R secondo il caso.

7.5. Consigli di prudenza

Il testo delle frasi S deve corrispondere a quello riportato nell'allegato IV del decreto legislativo

Usare ove applicabile le frasi S combinate nell'allegato IV.

7.5.1. Per le sostanze che figurano nell'allegato I, le frasi S sono quelle indicate nell'allegato. Se non sono indicate frasi S, il fabbricante o l'importatore possono includere qualsiasi frase o frasi S opportune.

7.5.2. Scelta dei consigli di prudenza

La scelta finale delle frasi relative ai consigli di prudenza deve tener conto delle frasi di rischio riportate sulle etichette e del previsto uso della sostanza o del preparato.

- in linea generale, saranno sufficienti al massimo 4 frasi S per formulare i consigli di prudenza più adeguati. In particolare, le combinazioni di frasi elencate nell'allegato IV sono considerate come una sola frase.
- in caso di pericolo per l'ambiente, usare come minimo una e come massimo quattro frasi S;
- alcune frasi R diventano superflue se si opera un'attenta selezione delle frasi S e viceversa;
- le frasi S che chiaramente corrispondono a frasi R figureranno sull'etichetta soltanto se si vuole sottolineare una determinata avvertenza.
- nella scelta dei consigli di prudenza occorre prestare particolare attenzione alle previste condizioni di utilizzazione di alcune sostanze e preparati, ad esempio gli effetti dell'applicazione a spruzzo o di altri aerosol. Le frasi vanno scelte tenendo presente l'utilizzazione prevista.

- i consigli di prudenza S1, S2 e S45 sono *obbligatori* per tutte le sostanze e i preparati molto tossici, tossici e corrosivi in vendita al dettaglio.
- i consigli di prudenza S2 e S46 sono *obbligatori* per tutte le altre sostanze pericolose (eccetto quelle soltanto classificate pericolose per l'ambiente) e per i preparati in vendita al dettaglio.

7.6. Il numero CEE

Se una sostanza indicata sull'etichetta è elencata nell'<European Inventory of Existing Commercial Chemical Substances> (EINECS) o nell' <European List of Notified Substances> (ELINCS), il numero EINECS o ELINCS della sostanza deve figurare sull'etichetta. Questa richiesta non si applica ai preparati.

8. CASI PARTICOLARI: SOSTANZE

8.1. Bombole mobili di gas

Per le bombole mobili di gas i requisiti di etichettatura sono ritenuti soddisfatti se essi sono conformi all'articolo 20 o all'articolo 21, paragrafo 6, lettera b) del decreto legislativo 3 febbraio 1997, n. 52. Tuttavia in deroga all'articolo 21, paragrafi 1 e 2, si potrà usare una delle seguenti alternative per le bombole di gas con una capacità inferiore o uguale a 150 l:

- il formato e le dimensioni dell'etichetta possono essere quelli indicati nella norma ISO/DP 7225;
- le informazioni di cui all'articolo 20, paragrafo 1, possono essere fornite su un dischetto o un'etichetta di informazione a carattere durevole fissata sulla bombola.

8.2. Bombole di gas destinate al propano, butano o al gas di petrolio liquefatto (GPL)

Queste sostanze sono classificate nell'allegato I. Benchè la loro classificazione sia conforme all'articolo 2, non costituiscono un pericolo per la salute umana quando vengono immesse in commercio, come gas combustibili liberati unicamente in vista della loro combustione, in bombole ricaricabili o in cartucce non ricaricabili disciplinati dalla norma EN 417.

Queste bombole o cartucce devono essere contrassegnate da un simbolo adeguato, nonché dalle frasi R e S relative all'infiammabilità. Non è necessario riportare sull'etichetta le informazioni relative agli effetti sulla salute umana. Tuttavia, le informazioni di questo tipo che avrebbero dovuto essere riportate sull'etichetta saranno trasmesse all'utente professionale dalla persona responsabile della commercializzazione della sostanza, secondo la modalità previste all'articolo 25 del decreto legislativo 3 febbraio 1997, n. 52. Le informazioni che riceveranno consentiranno loro di adottare i provvedimenti necessari per la tutela della salute e della sicurezza.

8.3. Metalli in forma massiva

Queste sostanze sono classificate nell'allegato I del decreto legislativo 3 febbraio 1997, n. 52 o vanno classificate in conformità dell'articolo 6 del decreto legislativo 3 febbraio 1997, n. 52. Tuttavia, talune di queste sostanze, anche se classificate in conformità dell'articolo 2 del decreto legislativo 3 febbraio 1997, n. 52.

non rappresentano un pericolo per la salute per inalazione, ingestione o a contatto con la pelle nella forma in cui vengono immesse in commercio. Tali sostanze non richiedono un'etichetta in conformità dell'articolo 20 del decreto legislativo 3 febbraio 1997, n. 52. Tuttavia, la persona responsabile dell'immissione in commercio del metallo trasmette agli utilizzatori professionali tutte le informazioni che avrebbero dovuto figurare sull'etichetta, tramite un sistema di informazione previsto dall'articolo 25 del decreto legislativo 3 febbraio 1997, n. 52.

8.4 Sostanze caratterizzate dalla frase R65

Le sostanze classificate come nocive per la loro pericolosità in caso di aspirazione non devono essere classificate come nocive e caratterizzate dalla frase R65 sulla loro etichetta se sono immesse in commercio in bombolette aerosol o in recipienti muniti di un dispositivo sigillato di nebulizzazione.

9. CASI PARTICOLARI: PREPARATI

9.1 Preparati gassosi (miscela di gas)

Per i preparati gassosi, è necessario prendere in considerazione quanto segue:

- valutazione delle proprietà fisico-chimiche;
- valutazioni dei rischi per la salute.

9.1.1. Valutazione delle proprietà fisico-chimiche

9.1.1.1. Infiammabilità

Le proprietà di infiammabilità di questi preparati sono determinate in conformità dell'articolo 3.2 del decreto ministeriale 28 gennaio 1992, secondo i metodi specificati nell'allegato V, parte A, del decreto legislativo 3 febbraio 1997, n. 52.

Tali preparati saranno classificati sulla base dei risultati delle prove eseguite e in relazione ai criteri di cui all'allegato V e ai criteri della guida di etichettatura.

In deroga a quanto sopra, tuttavia, nel caso in cui i preparati gassosi siano prodotti su commissione in quantità ridotte, l'infiammabilità delle suddette miscele gassose può essere calcolata con il seguente metodo:

l'espressione della miscela gassosa

$$A_1 F_1 + \dots + A_i F_i + \dots + A_n F_n + B_1 I_1 + \dots + B_i I_i + \dots + B_p I_p$$

dove: A, e B, frazioni molari

F, gas infiammabile

I, gas inerte

n, numero di gas infiammabili

p, numero di gas inerti

Può essere trasformata in modo che tutti gli I, (gas inerti) siano espressi da un equivalente di azoto utilizzando un coefficiente K, e che il contenuto equivalente di gas infiammabile A, sia espresso come segue:

$$A'_i = A_i \times \left(\frac{100}{(A_i + K_i B_i)} \right)$$

Usando il valore del contenuto massimo di gas infiammabile che, unito all'azoto, forma un composto non infiammabile nell'aria (Tci), si può ottenere la seguente espressione:

$$\sum_i A'_i / Tci \leq 1$$

La miscela di gas è infiammabile se il valore dell'espressione riportata in precedenza è superiore a 1. Il preparato è classificato come estremamente infiammabile ed è assegnata la frase R12.

Coefficienti di equivalenza (K_i)

I valori dei coefficienti di equivalenza K_i tra i gas inerti e l'azoto e i valori relativi al contenuto massimo di gas infiammabile (T_{ci}) sono forniti nelle tabelle 1 e 2 della norma ISO 10156 edizione 15.12.90.

Contenuto massimo di gas infiammabili (T_{ci})

Il valore relativo al contenuto massimo di gas infiammabili (T_{ci}) è fornito nella tabella 2 della norma ISO 10156 edizione 15.12.90.

Quando il valore T_{ci} di un gas infiammabile non figura nella norma di cui sopra, si utilizzerà il corrispondente limite inferiore di esplosività (LEL). Se non esiste alcun valore LEL, il valore del T_{ci} sarà fissato all'1% del volume.

Osservazioni

- L'espressione di cui sopra può essere utilizzata per consentire un'etichettatura appropriata dei preparati gassosi, ma non va considerata come un metodo per sostituire la sperimentazione per determinare i parametri tecnici di sicurezza.
- La suddetta espressione inoltre non serve a determinare se una miscela contenente gas combustibile possa essere preparata in modo sicuro. Infatti, quando si valuta l'infiammabilità, i gas comburenti non sono presi in considerazione.
- L'espressione di cui sopra fornirà risultati attendibili soltanto se i gas infiammabili non hanno effetti gli uni sugli altri per quanto concerne l'infiammabilità; è pertanto opportuno considerare questo aspetto, ad esempio con gli idrocarburi alogenati.

9.1.1.2. Proprietà comburenti

Considerato che l'allegato V del decreto legislativo 3 febbraio 1997, n. 52 non fornisce un metodo per la determinazione delle proprietà comburenti delle miscele gassose, tali proprietà vanno valutate utilizzando il metodo indicato di seguito.

Il metodo si basa sul principio della comparazione del potenziale comburente dei gas in una miscela con il potenziale comburente dell'ossigeno nell'aria. Le concentrazioni dei gas nella miscela sono espressi in volume per cento.

La comburenza della miscela di gas è considerata uguale o superiore a quella dell'aria se si verifica la seguente condizione:

$$\sum_i x_i C_i \geq 21$$

dove: x_i è la concentrazione di gas i in volume %
 C_i è il coefficiente di equivalenza dell'ossigeno.

In questo caso, il preparato viene classificato come comburente e verrà attribuita la frase R8.

Coefficienti di equivalenza tra gas comburenti ed ossigeno.

In appresso sono riportati i coefficienti utilizzati nel calcolo della capacità comburente di taluni gas in una miscela elencati al punto 5.2 nella norma ISO 10156 edizione 15.12.90 in relazione alla capacità comburente dell'ossigeno nell'aria.

O ₂	1
N ₂ O	0,6

Quando non esiste un valore per il coefficiente C_i di un gas nella norma di cui sopra, si attribuisce valore 40 a tale coefficiente.

9.1.2. Valutazione degli effetti sulla salute

La pericolosità per la salute di un preparato viene valutata in conformità dell'articolo 3 (3) del decreto ministeriale 28 gennaio 1992.

Qualora i rischi per la salute vengano valutati per mezzo del metodo convenzionale descritto all'articolo 3, paragrafo 5 del decreto ministeriale 28 gennaio 1992 con riferimento ai singoli limiti di concentrazione, i suddetti limiti da utilizzare vengono espressi in percentuale del volume e figurano:

- nell'allegato I del decreto legislativo 3 febbraio 1997, n. 52 per il gas o i gas in questione;
- o nell'allegato I del decreto ministeriale 28 gennaio 1992, tavole da IA a VIA qualora il gas o i gas in questione non figurino nell'allegato I, o vi figurino senza l'indicazione dei limiti di concentrazione.

9.1.3. Etichettatura

Per i contenitori mobili di gas, i requisiti di etichettatura sono rispettati quando sono conformi alle disposizioni dell'articolo 8, paragrafo 4, lettera b) del decreto ministeriale 28 gennaio 1992.

Tuttavia, in deroga agli articoli 8.1 e 8.2, per le bombole di gas con una capacità inferiore o uguale a 150 litri, la presentazione e le dimensioni dell'etichetta possono rispettare i requisiti della norma ISO 7225. In questo caso, l'etichetta può riportare la denominazione generica o quella industriale o commerciale del preparato, purché i componenti pericolosi del preparato siano indicati sul corpo della bombola in maniera chiara ed indelebile.

Le informazioni di cui all'articolo 7 possono essere fornite su un disco o un'etichetta durevoli integrati al recipiente.

9.2. Bombole di gas destinate a preparati contenenti del propano, del butano o del gas di petrolio liquefatto (GPL) odorizzati

Il propano, il butano e il gas di petrolio liquefatto sono classificati nell'allegato I. Benché i preparati contenenti queste sostanze siano classificati conformemente all'articolo 3 del decreto ministeriale 28 gennaio 1992, essi non costituiscono un pericolo per la salute umana quando vengono immessi in commercio, come gas combustibili liberati unicamente in vista della loro combustione, in bombole ricaricabili o in cartucce non ricaricabili disciplinate dalla norma EN 417.

Queste bombole o cartucce devono essere contrassegnate da un simbolo adeguato, nonché dalle frasi R e S relative all'infiammabilità. Non è necessario riportare sull'etichetta le informazioni relative agli effetti sulla salute umana. Tuttavia, le informazioni di questo tipo che avrebbero dovuto essere riportate sull'etichetta saranno trasmesse all'utente professionale dalla persona responsabile della commercializzazione in base alle modalità previste all'articolo 10 del decreto ministeriale 28 gennaio 1992. Le informazioni che riceveranno consentiranno loro di adottare i provvedimenti necessari per la tutela della salute e della sicurezza.

9.3. Leghe, preparati contenenti polimeri e preparati contenenti elastomeri

I suddetti preparati vanno classificati in conformità dell'articolo 3 ed etichettati in conformità dell'articolo 7 del decreto ministeriale 28 gennaio 1992. Tuttavia, taluni di questi preparati, anche se classificati secondo l'articolo 3 (3), non rappresentano un pericolo per la salute per inalazione, ingestione o a contatto con la pelle nella forma in cui vengono immessi in commercio: Tali preparati non richiedono un'etichetta in conformità dell'articolo 7; tuttavia tutte le informazioni che sarebbero dovute comparire sull'etichetta vanno trasmesse all'utilizzatore professionale tramite un sistema di informazioni secondo le modalità dell'articolo 10 del suddetto decreto.

9.4. Preparati caratterizzati dalla frase R65

I preparati classificati come nocivi per la loro pericolosità in caso di aspirazione non devono essere classificati come nocivi e caratterizzati con la frase R65 sull'etichetta se sono immessi in commercio in bombolette aerosol o in recipienti muniti di un dispositivo sigillato di nebulizzazione.

9.5. Perossidi organici

I perossidi organici combinano le proprietà di una sostanza comburente e di una combustibile in un'unica molecola: se un perossido organico si decompone, la parte comburente della molecola reagisce isotermicamente con la parte combustibile (soggetta a comburenza). Per le proprietà comburenti, non si possono applicare ai perossidi organici i metodi attuali di cui all'allegato V.

Si deve usare il seguente metodo di calcolo basato sulla presenza di ossigeno attivo.

Il tenore di ossigeno disponibile (%) di un preparato di perossido organico è dato dalla formula:

$$16 \times (n_i \times c_i / m_i)$$

dove:

n_i = numero di gruppi perossidici per molecola di perossido organico i ,

c_i = concentrazione (massa %) del perossido organico i ,

m_i = massa molecolare del perossido organico i .

ALLEGATO VII

ALLEGATO VII parte A

INFORMAZIONI RICHIESTE PER IL FASCICOLO TECNICO
(FASCICOLO DI BASE)

Qualora non sia tecnicamente possibile o non risulti scientificamente necessario fornire una determinata informazione, occorre addurre un'adeguata motivazione, che dovrà essere accettata dall'autorità competente.

Va menzionato il nome dell'ente o degli enti responsabili delle prove.

0 IDENTITÀ DEL FABBRICANTE ED IDENTITÀ DEL NOTIFICANTE; UBICAZIONE DEL
LUOGO DI PRODUZIONE

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante è stato designato unico rappresentante del fabbricante, identità e indirizzi degli importatori della sostanza nella Comunità.

1 IDENTITÀ DELLA SOSTANZA

1.1 Denominazione

1.1.1 Denominazione secondo la nomenclatura dell'IUPAC

1.1.2 Altre denominazioni (denominazione comune, denominazione commerciale, abbreviazione)

1.1.3 Numero CAS e denominazione CAS (se disponibile)

1.2 Formula bruta e formula di struttura

1.3 Composizione della sostanza

1.3.1 Purezza in percentuale (%)

1.3.2 Natura delle impurità, compresi gli isomeri e i prodotti secondari

1.3.3 Percentuale delle principali impurità (significative)

1.3.4 Se la sostanza contiene uno stabilizzante o un inibente oppure altri additivi precisarne: la natura, l'ordine di grandezza.

ppm, %

1.3.5 Dati relativi allo spettro (UV, IR, NMR o spettro di massa)

1.3.6 HPLC, GC

1.4 Metodi di individuazione e di determinazione

Descrizione completa dei metodi seguiti o indicazione dei relativi riferimenti bibliografici

Dovranno essere fornite informazioni, oltre che sui metodi di individuazione e di determinazione, sui metodi analitici noti al notificante che consentono di individuare una sostanza e i suoi prodotti di trasformazione dopo immissione nell'ambiente nonché di determinare l'esposizione umana diretta

2 DATI RELATIVI ALLA SOSTANZA

2.0 Produzione

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale connessa con il processo produttivo. Non sono richiesti dettagli precisi del processo produttivo, in particolare quelli di carattere delicato dal punto di vista commerciale

2.0.1 Procedimenti tecnologici impiegati per la produzione

2.0.2 Valutazione dell'esposizione in sede di produzione

— ambiente di lavoro

— ambiente

2.1. Utilizzazioni previste

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale alle sostanze, in connessione con le utilizzazioni proposte/previste.

2.1.1. Tipi di utilizzazione: descrivere la funzione della sostanza e gli effetti desiderati**2.1.1.1. Procedimento o procedimenti tecnologici in sede di impiego della sostanza (qualora noti)****2.1.1.2. Valutazione o valutazioni dell'esposizione in sede di impiego (qualora note):**

— ambiente di lavoro

— ambiente

2.1.1.3. Forma nella quale la sostanza è immessa sul mercato: sostanza, preparato, prodotto**2.1.1.4. Concentrazione della sostanza nei preparati e nei prodotti commercializzati (qualora nota)****2.1.2. Settori d'applicazione e ripartizione approssimativa:**

— industrie

— operatori dell'agricoltura e dell'artigianato

— libera vendita

2.1.3. Se del caso, identità dei destinatari della sostanza, qualora sia nota**2.1.4. Quantità e composizione dei residui derivanti dalle utilizzazioni proposte (qualora nota)****2.2. Produzione e/o importazione prevista per ciascuna delle utilizzazioni o ciascuno dei settori di utilizzazione considerati****2.2.1. Produzione e/o importazione complessiva in tonnellate/anno:**

— durante il primo anno civile

— nei successivi anni civili

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante è stato designato unico rappresentante del fabbricante, queste informazioni debbono essere fornite per ciascuno degli importatori di cui al punto 0.

2.2.2. Produzione e/o importazione ripartita secondo le indicazioni di cui ai punti 2.1.1 e 2.1.2, ed espressa in percentuale:

— durante il primo anno civile

— nei successivi anni civili

2.3. Metodi e precauzioni raccomandate concernenti:**2.3.1. — la manipolazione****2.3.2. — il deposito****2.3.3. — il trasporto****2.3.4. — l'incendio (natura dei gas di combustione o pirolisi, quando le utilizzazioni previste lo giustificano)****2.3.5. Altri pericoli, in particolare reazione chimica con l'acqua****2.3.6. Se del caso, informazioni sulle possibilità che la sostanza esploda se presentata in forma di polvere****2.4. Misure di emergenza in caso di dispersione accidentale****2.5. Misure di emergenza in caso di infortunio alle persone**

(esempio: avvelenamento)

2.6. Imballaggio**3. PROPRIETÀ FISICO-CHIMICHE DELLA SOSTANZA****3.0. Stato della sostanza a 20 °C e a 101,3 kPa****3.1. Punto di fusione****3.2. Punto di ebollizione****3.3. Densità relativa**

- 3.4. Tensione di vapore
- 3.5. Tensione di superficie.
- 3.6. Idrosolubilità
- 3.8. Coefficiente di ripartizione n. ottanolo/acqua
- 3.9. Punto d'infiammabilità
- 3.10. Infiammabilità
- 3.11. Proprietà esplosive
- 3.12. Temperatura di autoaccensione
- 3.13. Proprietà comburenti
- 3.15. Granulometria

Per le sostanze che potrebbero essere commercializzate in una forma che presenta il rischio di una esposizione per inalazione, dovrebbe essere effettuata una prova per stabilire la diffusione delle particelle della sostanza nella forma commercializzata.

4. STUDI TOSSICOLOGICI

4.1. Tossicità acuta

Per le prove di cui ai punti da 4.1.1 a 4.1.3, le sostanze diverse dai gas devono essere somministrate come minimo attraverso due vie, di cui una deve essere la via orale. La scelta della seconda via dipenderà dalla natura della sostanza e dalla probabile via dell'esposizione umana. I gas e i liquidi volatili debbono essere somministrati per inalazione.

- 4.1.1. Via orale
- 4.1.2. Inalazione
- 4.1.3. Via cutanea
- 4.1.5. Irritazione della pelle
- 4.1.6. Irritazione degli occhi
- 4.1.7. Sensibilizzazione della pelle

4.2. Somministrazione ripetuta

La via di somministrazione deve essere la più opportuna in funzione della probabile via dell'esposizione umana, della tossicità acuta e della natura della sostanza. In mancanza di controindicazioni si preferisce in genere la via orale.

4.2.1. Somministrazione di tossicità ripetuta (28 giorni)

4.3. Altri effetti

4.3.1. Mutagenesi

La sostanza deve essere esaminata con due prove. Una prova deve essere batteriologica (prova di revisione della mutazione), con e senza attivazione metabolica. L'altra deve essere una prova non batteriologica intesa a evidenziare aberrazioni o danni cromosomici. In mancanza di controindicazioni questa prova deve in linea di massima essere effettuata *in vitro*, con e senza attivazione metabolica. In caso di risultati positivi in una delle due prove, sono necessarie prove complementari, da realizzare secondo le indicazioni di cui all'allegato V.

4.3.2. Individuazione della tossicità connessa con il ciclo riproduttivo p m

4.3.3. Validazione del comportamento tossicocinetico di una sostanza in base ai dati contenuti nel fascicolo di base e altre informazioni pertinenti.

5. STUDI ECOTOSSICOLOGICI

5.1. Effetti sugli organismi

5.1.1. Tossicità acuta per i pesci

5.1.2. Tossicità acuta per la Daphnia

- 5.1.3. Prova di inibizione della crescita delle alghe
 - 5.1.6. Inibizione batterica
Nei casi in cui l'effetto inibitorio di una sostanza sui batteri potesse influire sulla biodegradazione, si dovrebbe effettuare una prova di inibizione batterica prima di procedere alla biodegradazione.
 - 5.2. Degradazione
 - biotica
 - abiotica:
Se la sostanza non è facilmente biodegradabile occorre valutare l'opportunità di eseguire la seguente prova: idrolisi in funzione del pH
 - 5.3. Prova di screening di assorbimento/desorbimento
 - 6. POSSIBILITÀ DI RENDERE INNOCUA LA SOSTANZA
 - 6.1. A livello industria/artigianato
 - 6.1.1. Possibilità di riciclaggio
 - 6.1.2. Possibilità di neutralizzare gli effetti indesiderati
 - 6.1.3. Possibilità di distruzione:
 - discarica controllata
 - incenerimento
 - impianto di depurazione delle acque
 - altre
 - 6.2. A livello libera vendita
 - 6.2.1. Possibilità di riciclaggio
 - 6.2.2. Possibilità di neutralizzare gli effetti indesiderati
 - 6.2.3. Possibilità di distruzione:
 - discarica controllata
 - incenerimento
 - impianto di depurazione delle acque
 - altre
-

ALLEGATO VII parte B

CARATTERISTICHE CHE FORMANO OGGETTO DEL FASCICOLO TECNICO
(FASCICOLO DI BASE)

Qualora non sia tecnicamente possibile o non risulti scientificamente necessario fornire una determinata informazione, occorre addurre un'adeguata motivazione, che dovrà essere accettata dall'autorità competente.

Il nome dell'ente o degli enti responsabili delle prove deve essere indicato.

In aggiunta alle informazioni di seguito richieste, l'Autorità competente, qualora lo consideri necessario per una valutazione dei rischi, può richiedere che il notificante fornisca le seguenti informazioni supplementari:

- tensione di vapore
- esame di tossicità acuta per la Daphnia

0 IDENTITÀ DEL FABBRICANTE ED IDENTITÀ DEL NOTIFICANTE, UBICAZIONE DEL LUOGO DI PRODUZIONE

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante è stato designato unico rappresentante del fabbricante, identità e indirizzi degli importatori della sostanza nella Comunità.

1 IDENTITÀ DELLA SOSTANZA

1.1 Denominazione

1.1.1 Denominazione secondo la nomenclatura dell'IUPAC

1.1.2 Altre denominazioni (denominazione comune, denominazione commerciale, abbreviazione)

1.1.3 Numero CAS e denominazione CAS (se disponibile)

1.2 Formula bruta e formula di struttura

1.3 Composizione della sostanza

1.3.1 Purezza in percentuale (%)

1.3.2 Natura delle impurità, compresi gli isomeri e i prodotti secondari

1.3.3 Percentuale delle principali impurità (significative)

1.3.4 Se la sostanza contiene uno stabilizzante o un inibente oppure altri additivi per conservare la natura, l'ordine di grandezza:

ppm; %

1.3.5 Dati relativi allo spettro (UV, IR, NMR o spettro di massa)

1.3.6 HPLC/GC

1.4 Metodi di individuazione e di determinazione

Descrizione completa dei metodi, con indicazione dei relativi riferimenti bibliografici.

Oltre che sui metodi di individuazione e di determinazione, informazioni sui metodi analitici noti al notificante che consentono di individuare una sostanza e i suoi prodotti di trasformazione dopo immissione nell'ambiente nonché di determinare l'esposizione umana diretta.

2 DATI RELATIVI ALLA SOSTANZA

2.0 Produzione

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale connessa con il processo produttivo. Non sono richiesti dettagli precisi del processo produttivo, in particolare quelli di carattere delicato dal punto di vista commerciale.

2.0.1 Procedimenti tecnologici impiegati per la produzione

2.0.2 Valutazione dell'esposizione in sede di produzione

- ambiente di lavoro
- ambiente

2.1. Utilizzazioni previste

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale alle sostanze, in connessione con le utilizzazioni proposte/previste.

2.1.1. Tipi di utilizzazione: descrivere la funzione della sostanza e gli effetti desiderati**2.1.1.1. Procedimento o procedimenti tecnologici in sede di impiego della sostanza (qualora noti)****2.1.1.2. Valutazione o valutazioni dell'esposizione in sede di impiego (qualora note):**

- ambiente di lavoro
- ambiente

2.1.1.3. Forma nella quale la sostanza è immessa sul mercato: sostanza, preparato, prodotto**2.1.1.4. Concentrazione della sostanza nei preparati e nei prodotti commercializzati (qualora nota)****2.1.2. Settori d'applicazione e ripartizione approssimativa:**

- industrie
- operatori dell'agricoltura e dell'artigianato
- libera vendita

2.1.3. Se del caso, identità dei destinatari della sostanza, qualora sia nota**2.2. Produzione e/o importazione prevista per ciascuna delle utilizzazioni o ciascuno dei settori di utilizzazione considerati****2.2.1. Produzione e/o importazione complessiva in tonnellate/anno:**

- durante il primo anno civile
- nei successivi anni civili

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante è stato designato unico rappresentante del fabbricante, queste informazioni debbono essere fornite per ciascuno degli importatori di cui al punto 0.

2.2.2. Produzione e/o importazione ripartita secondo le indicazioni di cui ai punti 2.1.1 e 2.1.2, ed espressa in percentuale:

- durante il primo anno civile
- nei successivi anni civili

2.3. Metodi e precauzioni raccomandate concernenti:**2.3.1. — la manipolazione****2.3.2. — il deposito****2.3.3. — il trasporto****2.3.4. — l'incendio (natura dei gas di combustione o pirolisi, quando le utilizzazioni previste lo giustificano)****2.3.5. Altri pericoli, in particolare reazione chimica con l'acqua****2.4. Misure di emergenza in caso di dispersione accidentale****2.5. Misure di emergenza in caso di infortunio alle persone (esempio: avvelenamento)****2.6. Imballaggio****3. PROPRIETÀ FISICO-CHIMICHE DELLA SOSTANZA****3.0. Stato della sostanza a 20 °C e a 101,3 kPa****3.1. Punto di fusione****3.2. Punto di ebollizione****3.6. Idrosolubilità**

3.8. Coefficiente di ripartizione n-ottanolo/acqua

3.9. Punto d'infiammabilità

3.10. Infiammabilità

4. STUDI TOSSICOLOGICI

4.1. Tossicità acuta

Per le prove da 4.1.1 a 4.1.2 è sufficiente una via di somministrazione. Sostanze diverse dai gas devono essere somministrate oralmente. I gas vanno somministrati per inalazione.

4.1.1. Via orale

4.1.2. Inalazione

4.1.5. Irritazione della pelle

4.1.6. Irritazione degli occhi

4.1.7. Sensibilizzazione della pelle

4.3. Altri effetti

4.3.1. Mutagenesi

Prove batteriologiche con e senza attivazione metabolica (prova di reversione della mutazione)

5. STUDI ECOTOSSICOLOGICI

5.2. Degradazione

— biotica

ALLEGATO VII parte C

CARATTERISTICHE CHE FORMANO OGGETTO DEL FASCICOLO TECNICO
(FASCICOLO DI BASE)

Qualora non sia tecnicamente possibile o non risulti scientificamente necessario fornire una determinata informazione, occorrerà addurre un'adeguata motivazione, che dovrà essere accettata dall'autorità competente.

Il nome dell'ente o degli enti responsabili delle prove deve essere indicato.

0. IDENTITÀ DEL FABBRICANTE ED IDENTITÀ DEL NOTIFICANTE SE NON SI TRATTA DELLA STESSA PERSONA; UBICAZIONE DEL LUOGO DI PRODUZIONE

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante è stato designato unico rappresentante del fabbricante, identità e indirizzi degli importatori della sostanza nella Comunità.

1. IDENTITÀ DELLA SOSTANZA

1.1. Denominazione

1.1.1. Denominazione secondo la nomenclatura dell'IUPAC

1.1.2. Altre denominazioni (denominazione comune, denominazione commerciale, abbreviazione)

1.1.3. Numero CAS e denominazione CAS (se disponibile)

1.2. Formula bruta e formula di struttura

1.3. Composizione della sostanza

1.3.1. Purezza in percentuale (%)

1.3.2. Natura delle impurità, compresi gli isomeri e i prodotti secondari

1.3.3. Percentuale delle principali impurità (significative)

1.3.4. Se la sostanza contiene uno stabilizzante o un inibente oppure altri additivi precisarne la natura, l'ordine di grandezza:

..... ppm; %

1.3.5. Dati relativi allo spettro (UV, IR, NMR o spettro di massa)

1.3.6. HPLC, GC

1.4. Metodi di individuazione e di determinazione

Descrizione completa dei metodi seguiti o indicazione dei relativi riferimenti bibliografici.

Oltre che sui metodi di individuazione e di determinazione, informazioni sui metodi analitici noti al notificante che consentono di individuare una sostanza e i suoi prodotti di trasformazione dopo immissione nell'ambiente nonché di determinare l'esposizione umana diretta.

2. DATI RELATIVI ALLA SOSTANZA

2.0. Produzione

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale connessa con il processo produttivo. Non sono richiesti dettagli precisi del processo produttivo, in particolare quelli di carattere delicato dal punto di vista commerciale.

2.0.1. Procedimento o procedimenti tecnologici impiegati per la produzione

2.0.2. Valutazione dell'esposizione in sede di produzione:

— ambiente di lavoro

— ambiente

2.1. Utilizzazioni previste

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale alle sostanze, in connessione con le utilizzazioni proposte/previste.

- 2.1.1. Tipi di utilizzazione: descrivere la funzione della sostanza e gli effetti desiderati
- 2.1.1.1. Procedimento o procedimenti tecnologici in sede di impiego della sostanza (qualora noti)
- 2.1.1.2. Valutazione o valutazioni dell'esposizione in sede di impiego (qualora note):
- ambiente di lavoro
 - ambiente
- 2.1.1.3. Forma nella quale la sostanza è immessa sul mercato: sostanza, preparato, prodotto
- 2.1.1.4. Concentrazione della sostanza nei preparati e nei prodotti commercializzati (qualora nota)
- 2.1.2. Settori d'applicazione e ripartizione approssimativa:
- industrie
 - operatori dell'agricoltura e dell'artigianato
 - libera vendita
- 2.1.3. Se del caso, identità dei destinatari della sostanza, qualora sia nota
- 2.2. Produzione e/o importazione prevista per ciascuna delle utilizzazioni o ciascuno dei settori di utilizzazione considerati
- 2.2.1. Produzione e/o importazione complessiva in tonnellate/anno
- durante il primo anno civile
 - nei successivi anni civili
- Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante è stato designato unico rappresentante del fabbricante, queste informazioni debbono essere fornite per ciascuno degli importatori di cui al punto 0.
- 2.2.2. Produzione e/o importazione ripartita secondo le indicazioni di cui ai punti 2.1.1 e 2.1.2, ed espressa in percentuale:

- 3.9. Punto d'inflammabilità
- 3.10. Inflammabilità
4. STUDI TOSSICOLOGICI
- 4.1. Tossicità acuta
- Una via di somministrazione è sufficiente. Le sostanze diverse dai gas devono essere somministrate per via orale. I gas vanno somministrati per inalazione.
- 4.1.1. Via orale
- 4.1.2. Inalazione

ALLEGATO VII parte D

DISPOSIZIONI SPECIFICHE RELATIVE AI FASCICOLI TECNICI (FASCICOLO DI BASE)
CONTENUTI NELLE NOTIFICHE DI CUI ALL'ARTICOLO 12

- A.** Ai sensi del presente allegato s'intende per
- "omopolimero", un polimero costituito da una sola specie di monomeri,
 - "copolimero", un polimero costituito da più di una specie di monomeri;
 - "polimero per cui è accettabile un insieme di prove ridotto" o "polimero IPR", un polimero che soddisfa i criteri indicati al punto C.2;
 - "famiglia di polimeri", un gruppo di polimeri (omopolimeri o copolimeri) con diversi pesi molecolari medi numerici o diverse composizioni derivanti da differenti rapporti tra le unità monomeriche. La differenza di peso molecolare medio numerico o di composizione non deve essere determinata da fluttuazioni involontarie connesse al processo bensì da alterazioni deliberate delle condizioni del processo senza che il processo in sé risulti modificato;
 - " M_n ", il peso molecolare medio numerico,
 - " M " il peso molecolare.
- B.** Approccio per famiglie
- Al fine di evitare prove superflue è possibile raggruppare i polimeri in famiglie il concetto è quello di sottoporre a prova i membri rappresentativi di una famiglia che presenti
- M_n variabile per gli omopolimeri, oppure
 - una composizione variabile con M_n approssimativamente costante per i copolimeri, oppure
 - per $M_n > 1000$, M_n variabile e una composizione approssimativamente costante per i copolimeri.
- Nei casi in cui si riscontrano effetti dissimili nei membri rappresentativi in conseguenza del campo di variazione del M_n o della composizione, sono necessarie ulteriori prove su altri membri rappresentativi.
- C.** Informazioni richieste per i fascicoli tecnici di cui all'articolo 12
- Qualora non sia tecnicamente possibile o non risulti scientificamente necessario fornire una determinata informazione, occorre addurre un'adeguata motivazione che dovrà essere sottoposta alle autorità competenti.
- Per la valutazione delle proprietà del polimero si può tener conto delle informazioni disponibili relative alle proprietà del(i) monomero(i).
- Fatto salvo l'articolo 3, paragrafo 1 del decreto legislativo 3 febbraio 1997, n°52, le prove devono essere effettuate conformemente alle metodologie riconosciute e raccomandate dai competenti organismi internazionali, qualora tali raccomandazioni esistano.**
- Deve essere indicato il nome dell'ente o degli enti responsabili delle prove.
- C.1. POLIMERI SOTTOPOSTI A UN INSIEME DI PROVE ORDINARIO**
- C.1.1. Polimeri presenti sul mercato comunitario in quantità ≥ 1 tonnellata o in quantità $\geq 5 t$.**
- Le informazioni e alle prove di cui all'articolo 7 indicate nell'allegato VII parte A si applicano le seguenti informazioni specifiche sui polimeri:
1. IDENTITÀ DELLA SOSTANZA
 - 1.2.1. Peso molecolare medio numerico
 - 1.2.2. Distribuzione dei pesi molecolari (DPM)
 - 1.2.3. Identità e concentrazione dei monomeri di partenza delle sostanze di partenza che saranno legati nel polimero
 - 1.2.4. Indicazione dei gruppi terminali identici e l'elenco dei gruppi funzionali reattivi
 - 1.2.5. Identità dei monomeri non reagiti
 - 1.2.6. Percentuale di monomeri non reagiti

2 DATI RELATIVI ALLA SOSTANZA

- 2.1.1.5. Una dichiarazione corredata delle informazioni pertinenti che indichi se il polimero è stato sviluppato in modo da essere degradabile nell'ambiente

3 PROPRIETÀ FISICO-CHIMICHE DELLA SOSTANZA**3.6.1 Estraiibilità in acqua**

Fatto salvo l'articolo 16, paragrafo 1 del decreto legislativo 3 febbraio 1997, n°52, ulteriori prove possono essere richieste in taluni casi, ad esempio:

- fotostabilità se il polimero non è specificamente reso stabile alla luce;
- estraibilità a lungo termine (test di lisciviazione). A seconda dei risultati di questa prova, possono essere richieste caso per caso prove appropriate di lisciviazione.

- C.1.2. *Polimeri immessi sul mercato comunitario in quantità < 1 t/anno o in quantità totali < 5 t, ma > 100 kg/anno, oppure in quantità totali > 500 kg*

In aggiunta alle informazioni e ai test di cui all'articolo 8, indicati nell'allegato VII parte B, si richiedono le seguenti informazioni specifiche sui polimeri:

1. IDENTITÀ DELLA SOSTANZA

- 1.2.1. Peso molecolare medio numerico
- 1.2.2. Distribuzione dei pesi molecolari (DPM)
- 1.2.3. Identità e concentrazione dei monomeri di partenza e delle sostanze di partenza che saranno legati nel polimero
- 1.2.4. Indicazione dei gruppi terminali, identità e frequenza dei gruppi funzionali reattivi
 - 1.3.2.1. Identità dei monomeri non reagiti
 - 1.3.3.1. Percentuale dei monomeri non reagiti

2. DATI RELATIVI ALLA SOSTANZA

- 2.1.1.5. Una dichiarazione corredata delle informazioni pertinenti che indichi se il polimero è stato sviluppato in modo da essere degradabile nell'ambiente.
- 3. PROPRIETÀ FISICO-CHIMICHE DELLA SOSTANZA
 - 3.6.1. Estraiibilità in acqua

- C.1.3. *Polimeri immessi sul mercato comunitario in quantità < 100 kg/anno o in quantità totali < 500 kg*

In aggiunta alle informazioni e alle prove di cui all'articolo 8, indicate nell'allegato VII parte C, si richiedono le seguenti informazioni specifiche sui polimeri:

1. IDENTITÀ DELLA SOSTANZA

- 1.2.1. Peso molecolare medio numerico
- 1.2.2. Distribuzione dei pesi molecolari (DMP)
- 1.2.3. Identità e concentrazione dei monomeri di partenza e delle sostanze di partenza che saranno legate nel polimero
- 1.2.4. Indicazione dei gruppi terminali, identità e frequenza dei gruppi funzionali reattivi
 - 1.3.2.1. Identità dei monomeri non reagiti
 - 1.3.3.1. Percentuale di monomeri non reagiti

2. DATI RELATIVI ALLA SOSTANZA

- 2.1.1.5. Una dichiarazione corredata delle informazioni pertinenti che indichi se il polimero è stato sviluppato in modo da essere degradabile nell'ambiente.

C.2. POLIMERI PER I QUALI È ACCETTABILE UN INSIEME DI PROVE RIDOTTO

In determinate condizioni l'insieme di prove del fascicolo di base per i polimeri può essere ridotto

Le sostanze con un elevato peso molecolare medio numerico, un basso contenuto di specie a basso peso molecolare e con una scarsa solubilità/estraibilità sono considerate non biologicamente disponibili. Di conseguenza per individuare i polimeri per i quali un insieme ridotto di prove è accettabile, si deve ricorrere ai seguenti criteri:

Per i polimeri non facilmente degradabili immessi sul mercato comunitario in quantità ≥ 1 t/anno o in quantità totali ≥ 5 t, i criteri in base ai quali si deve stabilire per quali polimeri è accettabile un insieme di prove ridotto sono i seguenti:

- I. un elevato peso molecolare medio numerico (M_n)⁽¹⁾,
- II. estraibilità in acqua (3.6.1)
< 10 mg/l escluso ogni apporto derivante da additivi e impurità,
- III. pesi molecolari < 1 000 in percentuale inferiore all'1 %; questa percentuale si riferisce soltanto alle molecole (componenti) direttamente derivate da uno o più monomeri, questo(i) ultimo(i) compreso(i), ed escluse altre componenti quali additivi o impurità.

Qualora tutti i criteri siano rispettati, per il polimero in questione è accettabile il ricorso ad un insieme di prove ridotto.

Nel caso in cui polimeri non facilmente degradabili siano immessi sul mercato comunitario in quantità < 1 t/anno o in quantità totale < 5 t, è sufficiente che siano soddisfatti i criteri I e II perché il polimero sia inserito fra quelli per cui un insieme di prove ridotto è accettabile.

Qualora non sia possibile provare il rispetto dei criteri mediante le prove stabilite, il notificante deve dimostrare il rispetto di tali criteri con altri mezzi.

In talune circostanze si possono richiedere prove tossicologiche ed ecotossicologiche.

C.2.1. Polimeri immessi sul mercato comunitario in quantità ≥ 1 t/anno o in quantità totale ≥ 5 t

0. IDENTITÀ DEL FABBRICANTE E IDENTITÀ DEL NOTIFICANTE · UBICAZIONE DEL LUOGO DI PRODUZIONE

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante sia stato designato unico rappresentante del fabbricante: identità e indirizzi degli importatori della sostanza nella Comunità.

1. IDENTITÀ DELLA SOSTANZA

1.1. Denominazione

1.1.1. Denominazione secondo la nomenclatura IUPAC

1.1.2. Altre denominazioni (denominazione comune, denominazione commerciale, abbreviazione)

1.1.3. Numero CAS e denominazione CAS (se disponibile)

1.2. Formula bruta e formula di struttura

1.2.1. Peso molecolare medio numerico

1.2.2. Distribuzione dei pesi molecolari (DPM)

1.2.3. Identità e concentrazione dei monomeri di partenza e delle sostanze di partenza che saranno legate nel polimero

1.2.4. Indicazione dei gruppi terminali, identità e frequenza dei gruppi funzionali reattivi

1.3 Composizione della sostanza

1.3.1. Grado di purezza (in percentuale)

1.3.2. Natura delle impurità, compresi i prodotti secondari

1.3.2.1. Identità dei monomeri non reagiti

1.3.3. Percentuale delle principali impurità (significative)

1.3.3.1. Percentuale di monomeri non reagiti

1.3.4. Se la sostanza contiene uno stabilizzante o un inibente oppure altri additivi: precisarne natura, l'ordine di grandezza ppin, %

1.3.5. Dati spettrali (UV, IR, NMR o spettro di massa)

1.3.6.1. GPC

(1) L'autorità che riceve la notifica decide sotto la propria responsabilità se il polimero soddisfa tale criterio.

1.4. Metodi di individuazione e di determinazione

Descrizione completa dei metodi seguiti o indicazione dei relativi riferimenti bibliografici.

Oltre che sui metodi di individuazione e di determinazione, fornire informazioni sui metodi analitici noti al notificante che consentono di individuare una sostanza e i suoi prodotti di trasformazione dopo immissione nell'ambiente nonché di determinare l'esposizione umana diretta.

2. DATI RELATIVI ALLA SOSTANZA**2.0. Produzione**

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale connessa con il processo produttivo. Non sono richiesti dettagli precisi del processo produttivo, in particolare quelli di carattere delicato dal punto di vista commerciale.

2.0.1. Procedimenti tecnologici impiegati per la produzione**2.0.2. Valutazione dell'esposizione in sede di produzione:**

- ambiente di lavoro
- ambiente

2.1. Utilizzazioni previste

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale alle sostanze, in connessione con le utilizzazioni proposte/previste.

2.1.1. Tipi di utilizzazione: descrivere la funzione della sostanza e gli effetti desiderati**2.1.1.1. Procedimento o procedimenti tecnologici in sede di impiego della sostanza (qualora noti)****2.1.1.2. Valutazione e valutazioni dell'esposizione in sede di impiego (qualora note):**

- ambiente di lavoro
- ambiente

2.1.1.3. Forma nella quale la sostanza è immessa sul mercato: sostanza, preparato, prodotto**2.1.1.4. Concentrazione della sostanza nei preparati e nei prodotti commercializzati (qualora nota)****2.1.2. Settori d'applicazione e ripartizione approssimativa:**

- industria
- operatori dell'agricoltura e dell'artigianato
- libera vendita

2.1.3. Se del caso, l'identità dei destinatari della sostanza, qualora sia nota**2.1.4. Quantità e composizione dei rifiuti derivanti dalle utilizzazioni proposte (qualora note)****2.2. Produzione e/o importazione prevista per ciascuna delle utilizzazioni e ciascuno dei settori di utilizzazione considerati****2.2.1. Produzione e/o importazione complessiva in tonnellate/anno:**

- durante il primo anno civile
- nei successivi anni civili

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante è stato designato unico rappresentante del fabbricante, queste informazioni debbono essere fornite per ciascuno degli importatori di cui al punto 0.

2.2.2. Produzione e/o importazione ripartita secondo le indicazioni di cui ai punti 2.1.1 e 2.1.2 ed espressa in percentuale:

- durante il primo anno civile
- nei successivi anni civili

2.3. Metodi e precauzioni raccomandati concernenti:**2.3.1. La manipolazione****2.3.2. Il deposito****2.3.3. Il trasporto****2.3.4. L'incendio (natura dei gas di combustione o prodotti, quando le utilizzazioni previste lo giustificano)****2.3.5. Altri pericoli, in particolare reazione chimica con l'acqua****2.3.6. Se del caso, informazioni relative alla suscettibilità all'esplosione qualora la sostanza si presenti sotto forma di polvere**

- 2.4 Misure di emergenza in caso di dispersione accidentale
- 2.5 Misure di emergenza in caso di infortunio alle persone (esempio : avvelenamento)
- 2.6 Imballaggio
- 3 PROPRIETÀ FISICO CHIMICHE DELLA SOSTANZA
- 3.0 Stato della sostanza a 20° C e a 101,3 kPa
- 3.1 Intervallo di fusione (derivato ad esempio : dalla prova di stabilità termica)
- 3.3 Densità relativa
- 3.6.1 Estraibilità in acqua
- 3.10 Infiammabilità
- 3.11 Proprietà esplosive
- 3.12 Autoinfiammabilità
- 3.15 Dimensioni delle particelle
Per le sostanze che possono essere commercializzate in una forma tale da creare il pericolo di esposizione per inalazione, occorrerebbe eseguire una prova per determinare la distribuzione delle particelle della sostanza nella forma in cui sarà commercializzata.
- 3.16 Stabilità termica
- 3.17 Estraibilità in :
— acqua a pH 2 e 9 a 37 °C
— cicloesano
- 4 STUDI TOSSICOLOGICI
Caso per caso, le autorità competenti possono richiedere, senza per ciò ritardare l'accettazione della notifica, alcune prove tossicologiche in presenza di gruppi reattivi o di caratteristiche strutturali/fisiche o della conoscenza delle proprietà di componenti a basso peso molecolare del polimero o di potenziali rischi di esposizione. In particolare possono essere richieste prove sulla tossicità per inalazione (ad esempio : 4.1.2, 4.2.1) qualora esista un rischio potenziale di esposizione
- 5 STUDI ECOTOSSICOLOGICI
Caso per caso, le autorità competenti possono richiedere, senza per ciò ritardare l'accettazione della notifica, prove ecotossicologiche in presenza di gruppi reattivi, di caratteristiche strutturali/fisiche o della conoscenza di proprietà di componenti a basso peso molecolare del polimero o di rischi potenziali di esposizione.
In taluni casi possono inoltre essere richieste le seguenti prove :
— fotostabilità se il polimero non è specificamente reso stabile alla luce,
— estraibilità a lungo termine (test di lisciviazione), a seconda dei risultati di questa prova, può essere richiesta, caso per caso, qualsiasi opportuna prova di lisciviazione
- 6 POSSIBILITÀ DI RENDERE INNOCUA LA SOSTANZA
- 6.1 A livello industria/artigianato
- 6.1.1 Possibilità di riciclaggio
- 6.1.2 Possibilità di neutralizzare gli effetti indesiderati
- 6.1.3 Possibilità di distruzione
— discarica controllata
— incenerimento
— impianto di depurazione delle acque
— altre
- 6.2 A livello libera vendita
- 6.2.1 Possibilità di riciclaggio
- 6.2.2 Possibilità di neutralizzare gli effetti indesiderati
- 6.2.3 Possibilità di distruzione
— discarica controllata
— incenerimento
— impianto di depurazione delle acque
— altre

C.2.2 Polimeri presenti sul mercato comunitario in quantità < 1 t/anno o in quantità totale < 5 t**0 IDENTITÀ DEL FABBRICANTE ED IDENTITÀ DEL NOTIFICANTE, UBICAZIONE DEL LUOGO DI PRODUZIONE**

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante sia stato designato unico rappresentante del fabbricante identità e indirizzi degli importatori della sostanza nella Comunità

1 IDENTITÀ DELLA SOSTANZA**1.1 Denominazione**

1.1.1 Denominazione secondo la nomenclatura IUPAC

1.1.2 Altre denominazioni (denominazione comune, denominazione commerciale, abbreviazione)

1.1.3 Numero CAS e denominazione CAS (se disponibile)

1.2 Formula bruta e formula di struttura

1.2.1 Peso molecolare medio numerico

1.2.2 Distribuzione dei pesi molecolari (DPM),

1.2.3 Identità e concentrazione dei monomeri di partenza e delle sostanze di partenza che saranno legate nel polimero

1.2.4 Indicazione dei gruppi terminali, identità e frequenza dei gruppi funzionali reattivi

1.3 Composizione della sostanza

1.3.1 Purezza in percentuale (%)

1.3.2 Natura delle impurità, inclusi i prodotti secondari

1.3.2.1 Identità dei monomeri non reagiti

1.3.3 Percentuale delle principali impurità (significative)

1.3.3.1 Percentuale di monomeri non reagiti

1.3.4 Se la sostanza contiene uno stabilizzante o un inibente oppure altri additivi precisarne la natura, l'ordine di grandezza.

ppm, %

1.3.5 Dati relativi allo spettro (UV, IR, NMR o spettro di massa)

1.3.6.1 GPC

1.4 Metodi di individuazione e di determinazione

Descrizione completa dei metodi seguiti o indicazione dei relativi riferimenti bibliografici

Oltre che sui metodi di individuazione e di determinazione, fornire informazioni sui metodi analitici noti al notificante che consentono di individuare una sostanza e i suoi prodotti di trasformazione dopo immissione nell'ambiente nonché di determinare l'esposizione umana diretta

2 DATI RELATIVI ALLA SOSTANZA**2.0 Produzione**

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana ed ambientale connessa con il processo produttivo. Non sono richiesti dettagli precisi del processo produttivo, in particolare quelli di carattere delicato dal punto di vista commerciale

2.0.1 Procedimenti tecnologici impiegati per la produzione

2.0.2 Valutazione dell'esposizione in sede di produzione

— ambiente di lavoro

— ambiente

2.1 Utilizzazioni previste

Le informazioni fornite in questa parte devono essere sufficienti per consentire una stima approssimativa ma realistica dell'esposizione umana e ambientale alle sostanze in connessione con le utilizzazioni proposte/previste

2.1.1 Tipi di utilizzazione descrivere la funzione della sostanza e gli effetti desiderati

2.1.1.1 Procedimento o procedimenti tecnologici in sede di impiego della sostanza (qualora noti)

- 2.1.1.2 Valutazione o valutazioni dell'esposizione in sede di impiego (qualora note)
 - ambiente di lavoro
 - ambiente
- 2.1.1.3 Forma nella quale la sostanza è immessa sul mercato sostanza, preparato, prodotto
- 2.1.1.4 Concentrazione della sostanza nei preparati e nei prodotti commercializzati (qualora nota)
- 2.1.2 Settori di applicazione e ripartizione approssimativa.
 - industrie
 - operatori dell'agricoltura e dell'artigianato
 - libera vendita
- 2.1.3 Se del caso, l'identità dei destinatari della sostanza, qualora sia nota
- 2.1.4 Qualità e composizione dei rifiuti derivanti dalle utilizzazioni proposte (qualora note)
- 2.2 Produzione e/o importazione previste per ciascuna delle utilizzazioni o ciascuno dei settori di utilizzazioni considerati
- 2.2.1 Produzione e/o importazione complessive in tonnellate/anno
 - durante il primo anno civile
 - nei successivi anni civili

Per le sostanze prodotte al di fuori della Comunità per le quali, ai fini della notifica, il notificante sia stato designato unico rappresentante del fabbricante, queste informazioni debbono essere fornite per ciascuno degli importatori di cui al punto 0
- 2.2.2 Produzione e/o importazione ripartita secondo le indicazioni di cui ai punti 2.1.1 e 2.1.2, ed espressa in percentuale
 - durante il primo anno civile
 - nei successivi anni civili
- 2.3 Metodi e precauzioni raccomandati concernenti:
 - 2.3.1 La manipolazione
 - 2.3.2 Il deposito
 - 2.3.3 Il trasporto
 - 2.3.4 L'incendio (natura dei gas di combustione o pirolisi, quando le utilizzazioni previsti lo giustificano)
 - 2.3.5 Altri pericoli, in particolare reazione chimica con l'acqua
 - 2.3.6 Se del caso, informazioni riguardanti la possibilità che la sostanza esploda qualora si presenti in forma di polvere
- 2.4 Misure di emergenza in caso di dispersione accidentale
- 2.5 Misure di emergenza in caso di infortunio alle persone (esempio: avvelenamento)
- 2.6 Imballaggio
- 3 PROPRIETÀ FISICO CHIMICHE DELLA SOSTANZA
 - 3.1 Stato della sostanza a 20° C e a 101,3 kPa
 - 3.2 Intervallo di fusione (ad esempio derivato dal test di stabilità termica)
 - 3.6.1 Estrattibilità in acqua
 - 3.10 Irritabilità.

ALLEGATO VIII

INFORMAZIONI E PROVE COMPLEMENTARI RICHIESTE CONFORMEMENTE
ALL'ARTICOLO 7, COMMA 2

Qualora non sia tecnicamente possibile o non risulti scientificamente necessario fornire una determinata informazione, occorrerà addurre una adeguata motivazione, che dovrà essere accettata dall'autorità competente.

Il nome dell'ente o degli enti responsabili delle prove deve essere indicato.

LIVELLO 1

Studi fisico-chimici

Ulteriori studi delle proprietà fisico-chimiche dipendenti dai risultati degli studi di cui all'allegato VII. Detti studi potrebbero includere per esempio l'elaborazione di metodi analitici che consentano di osservare e individuare una sostanza o i suoi prodotti di trasformazione nonché studi sui prodotti della decomposizione termica.

Studi tossicologici

Studio di fertilità (una specie, una generazione, maschi e femmine, via di somministrazione più adatta).

Se nella prima generazione si ottengono risultati dubbi, è necessario uno studio su una seconda generazione.

In funzione delle dosi somministrate potrebbero emergere indicazioni di teratogenicità. In tal caso è necessario effettuare uno studio formale di teratogenesi.

- Studio di teratogenesi (una specie, via di somministrazione più adatta)

Questo studio è necessario se la teratogenicità non è stata esaminata o valutata nello studio di fertilità.

- Lo studio di tossicità subcronica e/o cronica, compresi gli studi speciali (una specie, maschi e femmine, via di somministrazione più adatta) è necessario se dai risultati dello studio con somministrazione ripetuta di cui all'allegato VII o da altre informazioni pertinenti emerge la necessità di un esame più approfondito.

Tra gli effetti che rivelano la necessità di tale studio potrebbero ad esempio figurare:

- a) lesioni gravi o irreversibili;
- b) una dose "senza effetti" molto bassa o inesistente;
- c) un chiaro rapporto, per quanto riguarda la struttura chimica, tra la sostanza considerata ed altre sostanze che si sono dimostrate pericolose.

- Prove complementari di mutagenesi e/o prova o prove di screening della cancerogenesi, da effettuare secondo le modalità di cui all'allegato V.

Se entrambe le prove di base danno esito negativo dovranno essere effettuate altre prove conformemente alle proprietà specifiche e all'utilizzazione proposta della sostanza.

Se una prova o entrambe le prove di base danno risultati positivi, la prova complementare deve includere altri metodi di prova *in vivo* con gli stessi o con altri punti finali.

- Informazioni fondamentali di tossicocinetica

Studi di ecotossicità

- Studio prolungato di tossicità sulla *Daphnia magna* (21 giorni)
- Prova su una pianta superiore
- Prova su un lombrico
- Ulteriori studi di tossicità su un pesce
- Prova di accumulazione in una specie; una specie, preferibilmente un pesce
- Studio o studi complementari di degradazione, qualora gli studi di cui all'allegato VII non abbiano provato una degradazione sufficiente.
- Studi complementari sull'assorbimento/desorbimento in funzione dei risultati delle prove di cui all'allegato VII

LIVELLO 2**Studi tossicologici**

A meno che esistano ragioni valide e giustificate per non ricorrervi, il programma delle prove deve riguardare i seguenti aspetti:

- studio di tossicità cronica
- studio di cancerogenesi
- studio di fertilità (per esempio: studio di riproduzione su tre generazioni); solo se si è constatato un effetto sulla fertilità a livello 1
- studio di embriotossicità sugli effetti peri e postnatali
- studio di teratogenesi (specie non impiegate nelle prove corrispondenti del livello 1)
- ulteriori studi tossicocinetici che includono la biotrasformazione e la farmacocinetica
- prove complementari per determinare la tossicità per determinati organi o la tossicità sistemica

Studi di ecotossicità

- Prove complementari di accumulazione, degradazione, mobilità e assorbimento/desorbimento
- Studi complementari di tossicità sui pesci
- Studi di tossicità sugli uccelli
- Studi complementari di tossicità su altri organismi -

ALLEGATO IX

Parte A

Disposizioni relative alle chiusure di sicurezza per la protezione dei bambini

1. Imballaggi richiudibili

Le chiusure di sicurezza per bambini utilizzate per imballaggi richiudibili devono rispondere alla ISO 8317 (edizione 1° luglio 1989) che riguarda "Imballaggi di sicurezza per i bambini - Requisiti e metodi di prova degli imballaggi richiudibili" adottata dall'Organizzazione internazionale per la Standardizzazione (ISO).

2. Imballaggi non richiudibili (p.m.)

3. Osservazioni

1. La conformità con la norma suddetta può essere attestata unicamente dai laboratori che soddisfano le norme europee EN serie 45 000.

2. Casi particolari

Se appare evidente che un imballaggio è sufficientemente sicuro per i bambini, in quanto essi non possono avere accesso al suo contenuto senza l'aiuto di un utensile, il saggio può non essere effettuato.

In tutti gli altri casi, e quando vi sono sufficienti ragioni per dubitare dell'efficacia di una chiusura di sicurezza per bambini adottata, l'autorità nazionale può chiedere al responsabile dell'immissione sul mercato di fornirle un attestato rilasciato da un laboratorio di saggio di cui al punto 1 precedente, nel quale si certifica:

- che il tipo di chiusura è tale da non richiedere saggi secondo la norma ISO sopraindicata; oppure
- che la chiusura in questione, sottoposta ai saggi previsti dalla norma ISO sopraindicata, è conforme alle prescrizioni imposte.

Parte B

Dispositivi che permettono di rilevare i pericoli al tatto.

Le specifiche tecniche relative ai dispositivi che consentono di rilevare i pericoli al tatto devono essere conformi alla norma EN 272 (edizione 20 agosto 1989), relativa all'avvertimento tattile di un pericolo.

(9651455) Roma - Istituto Poligrafico e Zecca dello Stato - S.

MODALITÀ PER LA VENDITA

La «Gazzetta Ufficiale» e tutte le altre pubblicazioni ufficiali sono in vendita al pubblico:

- presso le Agenzie dell'Istituto Poligrafico e Zecca dello Stato in ROMA: piazza G. Verdi, 10 e via Cavour, 102;
- presso le Librerie concessionarie indicate nelle pagine precedenti.

Le richieste per corrispondenza devono essere inviate all'Istituto Poligrafico e Zecca dello Stato - Direzione Marketing e Commerciale - Piazza G. Verdi, 10 - 00100 Roma, versando l'importo, maggiorato delle spese di spedizione, a mezzo del c/c postale n. 387001. Le inserzioni, come da norme riportate nella testata della parte seconda, si ricevono con pagamento anticipato, presso le agenzie in Roma e presso le librerie concessionarie.

PREZZI E CONDIZIONI DI ABBONAMENTO - 1997

Gli abbonamenti annuali hanno decorrenza dal 1° gennaio e terminano al 31 dicembre 1997
i semestrali dal 1° gennaio al 30 giugno 1997 e dal 1° luglio al 31 dicembre 1997

PARTE PRIMA - SERIE GENERALE E SERIE SPECIALI

Ogni tipo di abbonamento comprende gli indici mensili

Tipo A - Abbonamento ai fascicoli della serie generale inclusi tutti i supplementi ordinari:			Tipo D - Abbonamento ai fascicoli della serie speciale destinata al regolamento:	
- annuale	L.	440.000	- annuale	L. 92.000
- semestrale	L.	250.000	- semestrale	L. 59.000
Tipo A1 - Abbonamento ai fascicoli della serie generale, inclusi i soli supplementi ordinari contenenti i provvedimenti legislativi:			Tipo E - Abbonamento ai fascicoli della serie speciale destinata ai concorsi indetti dallo Stato e dalle altre pubbliche amministrazioni:	
- annuale	L.	360.000	- annuale	L. 231.000
- semestrale	L.	200.000	- semestrale	L. 126.000
Tipo A2 - Abbonamento ai supplementi ordinari contenenti i soli provvedimenti non legislativi:			Tipo F - Abbonamento ai fascicoli della serie generale inclusi tutti i supplementi ordinari ed ai fascicoli delle quattro serie speciali:	
- annuale	L.	100.000	- annuale	L. 950.000
- semestrale	L.	60.000	- semestrale	L. 514.000
Tipo B - Abbonamento ai fascicoli della serie speciale destinata agli atti dei giudizi davanti alla Corte costituzionale:			Tipo F1 - Abbonamento ai fascicoli della serie generale inclusi tutti i supplementi ordinari contenenti i provvedimenti legislativi e ai fascicoli delle quattro serie speciali:	
- annuale	L.	92.500	- annuale	L. 850.000
- semestrale	L.	60.500	- semestrale	L. 450.000
Tipo C - Abbonamento ai fascicoli della serie speciale destinata agli atti delle Comunità europee:				
- annuale	L.	236.000		
- semestrale	L.	130.000		

Integrando con la somma di L. 125.000 il versamento relativo al tipo di abbonamento della parte prima, si riceverà anche l'Indice repertorio annuale cronologico per materie 1997.

Prezzo di vendita di un fascicolo della serie generale	L. 1.500
Prezzo di vendita di un fascicolo delle serie speciali I, II e III, ogni 16 pagine o frazione	L. 1.500
Prezzo di vendita di un fascicolo della IV serie speciale Concorsi ed esami	L. 2.800
Prezzo di vendita di un fascicolo indici mensili, ogni 16 pagine o frazione	L. 1.500
Supplementi ordinari per la vendita a fascicoli separati, ogni 16 pagine o frazione	L. 1.500
Supplementi straordinari per la vendita a fascicoli separati, ogni 16 pagine o frazione	L. 1.500

Supplemento straordinario «Bollettino delle estrazioni»

Abbonamento annuale	L. 140.000
Prezzo di vendita di un fascicolo ogni 16 pagine o frazione	L. 1.500

Supplemento straordinario «Conto riassuntivo del Tesoro»

Abbonamento annuale	L. 91.000
Prezzo di vendita di un fascicolo	L. 8.000

Gazzetta Ufficiale su MICROFICHES - 1997

(Serie generale - Supplementi ordinari - Serie speciali)

Abbonamento annuo (52 spedizioni raccomandate settimanali)	L. 1.300.000
Vendita singola: ogni microfiches contiene fino a 96 pagine di Gazzetta Ufficiale	L. 1.500
Contributo spese per imballaggio e spedizione raccomandata (da 1 a 10 microfiches)	L. 4.000

N.B. — Per l'estero i suddetti prezzi sono aumentati del 30%.

PARTE SECONDA - INSERZIONI

Abbonamento annuale	L. 410.000
Abbonamento semestrale	L. 245.000
Prezzo di vendita di un fascicolo, ogni 16 pagine o frazione	L. 1.550

I prezzi di vendita, in abbonamento ed a fascicoli separati, per l'estero, nonché quelli di vendita dei fascicoli delle annate arretrate, compresi i supplementi ordinari e straordinari, sono raddoppiati.

L'importo degli abbonamenti deve essere versato sul c/c postale n. 387001 intestato all'Istituto Poligrafico e Zecca dello Stato. L'invio dei fascicoli disguidati, che devono essere richiesti entro 30 giorni dalla data di pubblicazione, è subordinato alla trasmissione dei dati riportati sulla relativa fascetta di abbonamento.

Per informazioni o prenotazioni rivolgersi all'Istituto Poligrafico e Zecca dello Stato - Piazza G. Verdi, 10 - 00100 ROMA
abbonamenti ☎ (06) 85082149/85082221 - vendita pubblicazioni ☎ (06) 85082150/85082276 - inserzioni ☎ (06) 85082146/85082189
